An example of well-utilized expert assessment is the African Development Bank Governance Ratings 2014 (AFDB). Part of the Country Policy and Institutional Assessment (CPIA), the Governance Ratings assesses the quality of a country's institutional framework in terms of how conducive it is to fostering the effective use of development assistance. The index is characterized by maximum level of uniformity and consistency across all regional member countries surveyed. The CPIA is carried out by a group of country economists with vast experience in policy analysis. The knowledge of these experts is complemented with that of local contacts that provide both quantitative and qualitative insights. Peer discussions are also used to monitor the quality of the findings. Experts are asked to assess the transparency, accountability, and corruption in the public sector. Three dimensions are addressed: the accountability of the executive to oversight institutions and of public employees for their performance, access of civil society to information on public affairs, and state capture by narrow-vested interests. The assessment covers 40 African countries (TI 2015).

The Economist Intelligence Unit (EIU) Country Risk Ratings is another example of expert surveys. Country Risk Ratings are designed to provide in-depth and timely analysis of the risks of financial exposure in more than 140 countries. The EIU relies on teams of experts based primarily in London (but also in New York, Hong Kong, Beijing, and Shanghai) who are supported by a global network of in-country specialists. Each country analyst covers a maximum of two or three countries/territories. The economic and political reports produced by EIU analysts are subjected to a rigorous review process before publication. Scores are given as integers on a scale from 0 (very low incidence of corruption) to 4 (very high incidence of corruption). One hundred twenty-eight countries/territories were scored in 2015. Data is available to subscribers of EIU Country Risk Service (TI 2015).

### Composite Indexes

The assessment of corruption of citizen surveys, firm surveys, and expert assessments has various limitations. First, each is purposely defined too narrowly in order to capture different aspects of corruption. For instance, some might reflect only corrupt interactions between firms and public officials. Second, each is focused to various aspects of governance or other phenomena, corruption being only one of the components, frequently represented by a small number of questions. Third, each individual survey might introduce measurement errors due to bias, noise, or others. And fourth, each focuses on different sets of nations deepening on the organization's geographical or economical focus. No single source covers all world nations.

Composite indices seek to address some of these issues. Their rationale is that a combination of several sources helps capturing the different forms and dimensions of corruption, thus providing a more comprehensive measure of this complex phenomenon. The aggregation of several sources also reduces the margin of error, assuming that such errors are not correlated (i.e., sources are independent). Nation coverage also improves tremendously, however making indices interdependent.

The best-known example in this category is the Corruption Perception Index (CPI) that measures the degree to which corruption is perceived to exist among a country's public officials and politicians. The index is based on 17 surveys from 13 independent institutions that gather opinions of business people and country analysts.

The World Bank Institutes' Control of Corruption Index (CCI) is another well-known index that is also an aggregate of several sources. The index seeks to improve on the CPI by providing more nations, including nations where only one source of data was available. In contrast to the CPI which weights all sources equally, the CCI claims to weigh its sources objectively by attaching more importance to indices that correlate to one another. TI describes the measure as an indicator of perceptions of public sector corruption (administrative and political corruption) and not a measure of corruption levels of entire nations,

societies, their policies, or the activities of their private sector. Figure 1 illustrates the relationship between the PCI and the CCI. The indices correlate very well and seem to measure the same aggregate phenomena. Figures 2 and 3 also illustrate the relationship between these composite indices and regular citizen surveys. They clearly seem to measure different dimensions of corruption, national income appearing to have an effect on their scattering.

A common criticism of this framework is that aggregating corruption indicators from numerous sources – with the goal of increasing precision in measurement – does not always produce a more appropriate measure than using a single indicator or data source. One cost that should be considered is the loss of conceptual precision through aggregation (Knack 2006). Gains in statistical precision from aggregating sources of corruption data likely are far more modest than often claimed, because the assumption of independent error in measurement among data sources is violated (Knack 2006).

## General Criticisms and Limitations of Corruption Measurement

Both surveys and expert assessment have limitations beyond those already discussed. They are useful in presenting a general picture of where countries stand in terms of levels of corruption at a given time; however, they should not be mistaken for causal arguments, and their measurements should be looked at more as ordinal rather than continuous variables, thus limiting their statistical usefulness.

Firm surveys can be more appropriate for tracking changes over time than citizen surveys if the survey questions and sample design are identical in both periods and if other factors are controlled for where necessary. However, it is important to highlight that these measure only a small dimension of corruption, and they suffer of similar bias as citizen surveys do (Galtung et al. 2013). For instance, the surveying of firms and households is not effective in assessing the prevalence of corrupt transactions that occur entirely within the state, for example, when politicians bribe bureaucrats or when funds are illegally diverted. Furthermore, perceptions that corruption is an obstacle to doing business are potentially affected by optimism, or by prevailing economic conditions (Knack 2006). Many types of conflicts of interest also are not easily captured by firm surveys, for example, equity stakes of public officials, or employment promises to them by firms (World Bank 2000).

**Globalization and Corruption, Fig. 1** Two aggregate indicators based on expert surveys: Transparency International's Corruption Perception Index and World Bank Institute's Control of Corruption. Note that both indices are highly correlated. (Source: Author (Murillo))

**Globalization and Corruption, Fig. 2** Relationship between one of the dimensions of the Global Corruption Barometer and World Bank Institute's Control of Corruption. (Source: Author (Murillo))

**Globalization and Corruption, Fig. 3** Relationship between TI's Corruption Perception Index and one of the dimensions of the Global Corruption Barometer. (Source: Author (Murillo))

Furthermore, in firm surveys and citizen surveys alike, there are difficulties in obtaining honest responses when addressing a social or cultural taboo or an issue in which the respondent has a high degree of complicity (Galtung et al. 2013). Similarly, the current political climate fueled by mainstream media, social media, or other communication mechanisms might introduce bias in the respondent's answers. The above biases can be complicated with the particular cultural background of respondents, their level of expertise in the subjects (i.e., education and awareness), whether they live or have lived in other nations, and whether they are rural or urban dwellers. Some surveys

might be overly focused to citizens of urban areas, thus introducing further bias.

Likewise, expert opinions about the extent of corruption might reflect the frequency of muckraking media reports, of government anti-corruption campaigns, or of politically motivated accusations by opposition politicians. Ratings by international business people and experts, disproportionately drawn from developed Western countries, might be influenced by Western preconceptions or by the raters' greater familiarity with certain cultures. Some of the organizations that prepare corruption ratings might also have ideological axes to grind. For all these reasons, "perceived corruption" may reflect many other things besides the phenomenon itself (Treisman 2007).

Most importantly, the different measures reflect differences in regard to the nature of corruption. They disagree on the definition, the rigor of the framework and survey, the sample size and characteristics, the role of culture, among many others. Overall, existing corruption indicators differ importantly in the aspects of corruption they purport to measure, in clarity and breadth of definition, and in the methods and transparency of their assessments. For these reasons, no one indicator or data source is best for all purposes (Knack 2006). The lack of a formal framework that will appropriately capture the concept of corruption stands out in contrast to the practices of measuring whatever dimension of corruption is readily available through existing tools. This leads to large bias and prejudgment that the funding organizations can set upon the methodology and measurement instruments. For instance, poor and simple societies tend to be more corrupt than rich and complex ones; however, this assumption largely ignores major corruption in developed nations and the elusive nature of lesser forms of corruption that could have permeated the complex Weberian system in evolved forms. The fact that visible corruption (such as bribes in public service) is more often associated with more primitive levels of economic and political development (Zimring and Johnson 2005) might be an indication that we are conveniently measuring what is obvious and not what is essential. That might be one of the reasons that complexity is associated with lower levels of corruption. Indeed, corruption is an evolving phenomenon that takes different forms depending on the controls that the system sets, adopting lesser visible behaviors in order to avoid the deterrents and preventions that grow with Weberian complexity (Zimring and Johnson 2005). Perhaps most concerning of all is that the indices are frequently used for policy-making without the requisite reevaluation needed for this new role (Ledeneva 2009). This takes us to innovation in the monitoring of corruption.

## New Technological Approaches to Corruption (Murillo)

If we want to move beyond the general perceptions of a country's overall levels, we find the monitoring of corruption challenging. Until the mid-1990s, most of the empirical findings on corruption in the academic literature were of an incidental or anecdotal nature. The evidence was based on particular, well-defined events or settings. Sometimes this was drawn from fieldwork and interviews, occasionally on legal and other primary sources and quite often on items and scandals reported in the media. The general problem in writing about corruption was that "the facts cannot be discovered, or that if they can, they cannot be proved." Even in our current context, major corruption can only be found through unofficial channels such as leaks, whistleblowers, "hackers," and other actors; this makes us rethink and ponder of the validity of current indices and also examine the role of modern technologies in incorporating other dimensions of corruption to current measurements.

### The Principal-Agent Framework, Adjusted

To better understand the relationship between the citizen and the government, political scientists have often utilized the principal-agent framework. This framework provides a useful representation of the asymmetric relationship between a government and its constituency, with an informational advantage on the side of the government and authority on the side of the agent (Miller 2005;

**Globalization and Corruption, Fig. 4** The agent, principal, and information asymmetry. (Source: Author (Murillo))

Lindstedt and Naurin 2010; Spence and Zeckhauser 1971; Miller 2005). In this framework, the principal (citizen) delegates authority to the agent (government); however, the preferences of the former are different from those of the latter. Corruption is one of the agent's activities that benefits its own interests rather than the principal's (Miller 2005). Transparency is therefore key to holding government accountable (Fig. 4).

Transparency can be categorized using two dimensions: *how* information is released and *what type* of information is released. These can be relevant for the identification and measurement of corruption.

Within the principal-agent framework, two types of transparency are identified, depending on who controls the release of governmental information (Lindstedt and Naurin 2010). *Agent-controlled transparency* is the agent's release of information about its activities as mandated by the agent itself or externally imposed by the principal. This mandate could be self-imposed by the agent in an effort to increase its legitimacy or imposed by the principal in order to increase control, as modern freedom of information or other mandates do. *Non-agent-controlled transparency* is the release of information through the work of an independent and investigative media or other third-party source such as whistleblowers. While agent-controlled transparency makes the life of the agent more complicated, non-agent-controlled transparency makes it more dangerous, as it may identify actual instances of corruption and illegal activity (Lindstedt and Naurin 2010).

The type of transparency depends on the type of information released. Two types of transparency can be identified, *economic and institutional transparency* and *political transparency*. Economic and institutional transparency is related to the content, accessibility, and usefulness of economic and institutional information. It deals with transparency of economic and financial information, the budget and its process, economic policy-making, and public administration, among many others. It also deals with the implementation of Freedom of Information Laws and other transparency enablers (Bellver and Kaufmann 2005; Knack 2006). This type of transparency can be highly relevant in the context of an ever increasing globalized market and the opportunities for corruption at new scales, which seem to be growing. Political transparency is related to open debate and accountability in political institutions. It relates to transparency in political funding, openness and competitiveness of political participation, independence of the media, disclosure of politician's assets, voting records, etc. (Von Alemann 2004; Bellver and Kaufmann 2005; Knack 2006).

With the principal-agent framework in place, we now identify the various approaches to measure corruption, including what we measure, how we measure, and where we measure.

As illustrated in Fig. 4, corruption could be directly identified (thus measured) by monitoring the agent and the agent's actions at all times. However, this would be prohibitively expensive and unfeasible, as postulated by the principal-agent framework. For instance, some US states

have required to police officers to carry out body cameras in order to document their dealings while in duty in the field. Similar requirement to all public office holders would certainly make their visible actions more transparent; however, the costs of the processing of information resulting from monitoring the actions, activities, documents, messages, dealings, and other activities of every single public servant would be extremely high. Thus, as the principal-agent framework postulates, gathering complete information on the agent's actions is regarded as prohibitively expensive (and not feasible, at least for now), thus resulting in a preference for shirking.

A second manner of measuring corruption is by monitoring the information that the agent makes available proactively (agent-controlled) and finding incongruencies through different types of analyses, work generally done by civil society, investigative media, or other stakeholders. As the principal-agent framework assumes, the nature of the agent makes him withhold information in order to satisfy its own interests (i.e., hide inefficiency and corruption). Freedom of Information Laws and digital technology are facilitating the possibility of having more information available proactively, in a timely manner, and with technical sophistication that would facilitate its processing.

However, there are still various barriers to utilize information for measuring corruption. First, in most nations, the availability of information that is relevant for identifying corruption is highly reactive, generally obtained through highly bureaucratic Freedom of Information processes can take long time. And, second, specialized online portals that claim to make governments more transparent are not sharing information that is relevant for the identification of corruption (Shkabatur 2013; Murillo 2014) and are not utilizing appropriate technical sophistication and tools that would allow different segments of the population identify instances of corruption (Murillo 2014).

There are various technical tools and other processes that could be relevant in making government actions transparent in order to curb corruption. For instance, the utilization of appropriate technical standards and the adherence of global processes (such as "open budgets" and "open procurement") will certainly have an effect in identifying occurrences of corruption; however, we argue that these will mostly have an effect in curving corruption or even changing the way that corrupt acts are being carried out.

Actors such as civil society, investigative journalists, and the international community can leverage the processing of data in order to identify instances of corruption. Tools such as "crowdsourcing," technical standards, and even artificial intelligence will certainly help in identifying corruption. While the monitoring of the agent might switch from prohibitively expensive to highly expensive, the evolving nature of corruption might make it even more hidden, to the depths of technical processes. There are some emerging frameworks and limited efforts to measure government's economical and institutional transparency, an important requisite for identifying corruption (Piotrowski 2010; Hollyer et al. 2012; Murillo 2012).

A third manner of measuring corruption is through non-agent controlled transparency, that is, through assessing acts that are exposed through whistleblowers, leaks, investigative journalists, hackers, or other major actors. The use of these actors to provide governmental information generally signifies that "grand corruption" is involved in such disclosures. Measuring corruption based on non-agent controlled transparency has two main issues. The first is that it generally measures major corruption (happening at various political and administrative levels of a nation), and the second is that it is highly biased, as the measurement is highly in function of the "capacity" of the nation to disclose information in unofficial manners, which might depend on whistleblower protection laws. Naturally, nations who do not have such laws might be harsher with the different actors present, thus presenting lesser number of non-agent-controlled transparency disclosures. The advent of the Internet, databases such as Wikileaks, and the spread of investigative journalism have been a key factors in disclosing corruption instances. Furthermore, with the evolving

nature of corruption that adopts lesser visible behaviors in order to avoid the deterrents (Zimring and Johnson 2005), non-agent-controlled transparency might be a key tool for identifying major corruption acts.

In conclusion, despite the increasing ease of sharing information through the Internet, the lack of data and the high cost of monitoring the agent impede progress. However, as the bureaucratic process gets more automated and as technical tools gradually become part of human interactions, the identification and measurement of corruption through agent-controlled transparency might become a reality (Galtung et al. 2013; Murillo 2014).

Thus, for now, we are obliged to utilize indirect methods and proxies in order to measure corruption, or properly put, perceptions of corruption. This is done through representative surveys of service users, expert assessments, and composite indices composed of the above methods, when data is available (Knack 2006; Ledeneva 2009).

More comprehensive measures of corruption should include objective measurements (of what is actually occurring) and subjective assessments (of how those involved perceive or understand what is occurring). The information is needed because the reactions of people to anticorruption efforts will be governed by their own perceptions (Galtung et al. 2013). Therefore, the approaches to culture also underline that compliance should be norm based as much as enforcement based. The two should in fact be mutually self-reinforcing (Hira and Shiao 2016). Thus, culture and norms can be reconciled with the economic approaches.

## Corruption, Development, and Globalization (Hira)

Corruption is synonymous with underdevelopment. Throughout the developing world, the ineffectiveness of government remains a major impediment to economic growth and citizen satisfaction. Corruption leads to declines in and misallocation of investment (Uhlenbruck et al. 2006). Concerns about corruption have led to ongoing spontaneous protests throughout the developing world, which increasingly evolve into more organized anti-corruption movements, such as the Hazare movement in India which sprang up in 2011. While NGOs such as Transparency International play a valuable assisting role, the role of international organizations and multinational corporations (MNCs) is more scrutinized.

By their charters, the World Bank and the IMF cannot engage in domestic politics. Yet, their activities speak otherwise. Numerous reform efforts, often tied to meeting international debt obligations, have followed the logical lines of creating a Weberian-type bureaucracy, meritocratic, transparent, and accountable to national interests. Moreover, since the 1980s, increasing emphasis has been placed on reducing the role of the government, including extensive privatization of state-owned enterprises, aka neoliberalism. The World Bank's own governance indicators have become a primary means to measure corruption. Measuring items such as days to open a new business, the indicators reflect the difficulties created by both bureaucratic inefficiency and corruption. At the same time, such surveys (including that of Transparency International) are often accused of being biased toward Western interests in market liberalization, to assure investors. As a result, the efforts have more recently attempted to engage in citizen surveys and broader indicators to reflect more domestic sentiment. Yet, the choice of indicators and how they are reported and used, despite warnings by the issuers, remains controversial. There is no indication based on indices that neoliberalism has had any effect on levels of corruption. In broad terms, international organizations as well as foreign NGOs have to deal with host governments in order to be able to operate, thus exposing them to tacit cooperation with often corrupt entities.

Certain international organizations have taken a more active stance. The United Nations, for example, created the UN Global Compact in 2000 to set up principles for MNC activity, including reducing collusion for corruption. The UN has also set up certain organizations such as CICIG

(International Commission against Impunity in Guatemala) which have acquired quasi-legal status, at the behest of the host government, to fight corruption and human rights abuses. The International Criminal Court, set up to deal with the latter, does not have any mandate for dealing with corruption.

Findings on MNC activities are blurry. MNCs are routinely accused of shady deals with corrupt governments, with trillions unaccounted for, such as the recurrent scandals around Nigeria's oil industry or many arms deals. MNCs often counter that they are merely following local practices and have a better record than domestic counterparts. Statutes in the West designed to curb such practices, such as the US Foreign Corrupt Practices Act, seem to have quite limited practical effect in reducing corruption. Some would go further and state that even some legal mechanisms, such as export financing, amount to effective subsidies. However, countries wanting to curb such practices find their MNCs complaining that they will be shut out of such markets by their competitors, including those from emerging markets who face minimal pressure, if they do so. MNCs frequently use their global nature, for example, through transfer pricing to subsidiaries, to reduce taxes and hide transactions from prying eyes. In turn, governments seeking to crackdown on unwanted MNC behavior face the possibility that they will lose work to countries willing to look the other way. In line with the Global Compact, MNCs have ubiquitously adopted corporate social responsibility platforms. However, analysis of such behavior indicates haphazard, at best, compliance, even when there are third-party monitors (Hira and Rea 2015).

The problem for curbing corruption on a global scale is even more daunting, given the setup of the global financial system. As revealed in reporting around the Panama Papers emerging from a hack of a legal firm in 2016, individuals and companies everywhere freely use non-reported offshore banking havens to hide assets from tax collectors and for use in illicit activities. Despite some increase in reporting requirements following the 2008 financial crisis, Western government are still unwilling to close down such havens.

## Conclusion and Recommendations

Developing countries clearly lack or are underdeveloped in terms of accountability and transparency, ranging from property rights to independent judiciaries. Yet, attempts to create such institutions as meritocratic recruitment have generally met with resistance, which can be explained by deeply embedded cultural norms. In considering the economic vs. the cultural approaches to corruption, we find that both work together. In the development of rule of law and good governance in the West, cultural and bureaucratic norms were established that were then reinforced through legal sanctions. The occasional scandal that grabs media attention in the West and bigger questions around campaign finance and procurement contracts demonstrate that such norms are not only alive and well but necessary for a legal regime to be effective. Emerging measurements of corruption seek to combine elements of objective transparency and accountability with perceptions, addressing the principle weaknesses of both survey- and expert-based assessments. The development of the internet also holds promise for increasing transparency, for example, by making budgets and procurement contracts publically available.

Acknowledging that culture or group norms have a direct impact on levels of corruption is not the same as finding causal mechanisms that would suggest reforms (Licht et al. 2007). Examining the history of anti-corruption in the West reveals that rule of law evolved over centuries and that vigilance must be constant. History cannot be reproduced, thus suggesting that while there may be some general lessons, it is likely that each region, or possibly each country, must find its own way forward. Complicating the situation even further in developing countries is the fragile nature of their states, postcolonial and fragmented along ethnic, religious, and class lines, traditional institutions persist in the shadow of formal Western ones (Hira 2016). The persistence of institutions over long periods of time suggests a far greater effort that is needed to make inroads on corruption (Acemoglu et al. 2001).

# Globalization and Culture

Chantal Crozet
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Introduction

Given the wide interest in both globalization and culture from diverse academic fields such as anthropology, sociology, communication and media, cultural and language studies, colonial and indigenous studies, and political science and international relations, it is not surprising to find little consensus in the literature on the definitions of these two concepts, let alone consensus on how they relate to each other and on their role and impact on individuals and societies.

This entry provides insights into the links between globalization and culture, based on a selective review of the literature, aiming to offer some reference points for further reflection to professionals, researchers, and students in public administration and public policy. It reflects first on the concepts of culture and of globalization, what characterizes both and how they relate to each other. It then focuses on the links between culture, globalization, and language followed by concluding remarks.

## Culture and Globalization

The cultural dimension of globalization, or "cultural globalization" refers to the circulation and sharing of ideas and of meanings and values across countries; hence across cultures, with the effect of increasing social contacts (Paul 2006), this presumably leads to more positive human interconnectedness. Reflecting on how culture has been understood and used so far helps in turn understand issues associated with its global circulation and sharing.

### Culture

As humans, we produce culture to make and share meaning over everything we do, feel, think, and believe in. In this sense culture is an intrinsic part of human nature (Geertz 1973). Without culture Geertz (1973, p. 49) further argues, men (and women) would be "unworkable monstrosities" and "mental basket cases" incapable of making sense of themselves, others and the world they live in. Culture helps identify distinct collectivities (Grillo 2003). It can be thought of as a blueprint left to individuals to share and to adopt, or not. In any case, as pointed out by Hearn (2006):

> . . .. culture is not a private affair – it is by definition shared, however imperfectly with other people. (Hearn 2006, p. 170)

Traditionally a differentiation has been made between high and low culture. High culture refers to the dominant elitist form of a culture (e.g., its literature and its fine arts), dominant in the sense that it tends to be shared by a minority of people with the highest socioeconomic power. By contrast, low culture refers to the way of life shared by the majority of a given people of all social

backgrounds. It includes, for instance, national cuisines and its variations, national preferred sports, popular festivities including popular music, and fashion. However, democratic and global processes have watered down the divide between high and low culture by valuing all forms of cultural expression. Nonetheless it is still a useful distinction to capture power in culture dynamics in particular contexts.

French sociologist Bourdieu (1986) introduced the concept of "cultural capital," in the context of his work on class inequalities in education. It is however a useful concept in many other contexts. Cultural capital, according to Bourdieu, is acquired from one's particular socioeconomic background and degree of formal education and would determine one's place in social hierarchies. It includes three dimensions of culture: embodied, objectified, and institutionalized. For example, one's accent in speaking a national language is embodied culture (with all its possible social variables), the ownership of goods such as real estate is objectified culture, and educational qualifications represent institutionalized culture. Critics of Bourdieu have pointed out a lack of consideration given to individual agency in his theory of culture reproduction, as well as of consideration of the impact of the growth of the middleclass on class inequalities (see Goldthorpe 2007; King 2000). (For both praise and critics of Bourdieu's key theoretical concepts, see Coulangeon and Duval (2013)).

The concepts of high and low culture, of identifiable collectivities on the basis of culture, and of cultural capital, however useful they may be in understanding the plays of culture in societies and individuals, must take account of further characteristics of the nature of culture.

Academics, in particular anthropologists for whom culture is central to their discipline, have fought wars over this matter, trying to determine whether culture is a static/objective or a dynamic/subjective phenomena (see Grillo 2003; Matera 2016, for instance, for an account of these "culture wars"). The static/objective, also called *modernist*, view of culture represents a scientific and descriptive interpretation of culture, articulated first by the British anthropologist Edward Burnett Tylor and for who culture was a complex whole of fixed, clearly identifiable attributes, such as: knowledge, belief, arts, morals, law, and custom (Tylor 1871). The later more dynamic/subjective, also called *postmodernist*, view of culture is embedded in Geertz's (1973) early work. It focuses on the search for meaning in culture, rather than mere description and categorization, in his words:

> Man is an animal suspended in webs of significance he himself has spun. I take culture to be those webs and the analysis of it to be therefore not an experiential science in search of law but an interpretive one in search of meaning. (Geertz 1973, p. 6)

Since the 1970s, postmodern views on culture have been dominant in academia, aware of the unreliability of fixed metanarratives on what constitutes culture (see Lyotard 1979). Some academics, concerned that cultural discrimination is fed by modernist hence essentialist interpretations of culture (an essentialist interpretation of culture, also called "cultural essentialism" refers to an understanding and use of culture as static and bounded. It does not recognized the fact that all cultures have many variables, are diverse, dynamic, and changeable within themselves. Nationalist political movements commonly seek to promote essentialist perspectives on culture.), go as far as suggesting to abandon the concept altogether. Wikan (1999), for instance, proposes to consider instead only individuals and their rights. Wagener (2015) proposes to replace the culture concept with new theories capable of explaining better the complexities of daily life, which implies considering the role of power in the working of culture in social, ethnic, and political tensions.

The notion of "intersectionality" captures succinctly the interplay between power, culture, class, ethnicity, and gender. Intersectionality (or intersectional theory), as a concept, was first coined by Crenshaw (1991), in the context of discrimination and violence against women. It is now widely applied in other contexts requiring an understanding of the dynamics between power and cultural variables.

One way out of the controversy over the nature of culture and its complexity is to go back to

Williams' (1977) concept of culture as dynamic and contradictory interactions between *dominant*, *residual*, and *emergent* forms of culture, with the caveat that those three forms of culture can be both tangible and intangible. Tangible culture refers to visible aspects of culture such as traditional French cuisine, Japanese manga, or the practical dimensions of religious rituals. Whereas intangible culture refers to the less visible aspects of culture in the domain of beliefs, myth, ideologies (religious, political, and other), as well as aspirations and projections – what Appadurai (1996) coined "imaginary work" (see further discussion on this topic in the next section), intangible culture in this sense operates on a more subjective and also unconscious level; hence it is harder to capture.

The notion of dominant culture in Williams can help explain how dominant social structures are maintained but also how they can be subverted by dissident individuals or groups of individuals. Residual culture is the influence of old cultural patterns, either archaic, outdated but still influencing the current culture, can be dominant, or not. Emerging culture represents new cultural ideas and practices, including those produced by minority groups, potentially from all strata of society, and which can become mainstream or not. The hippie culture of the 1960s in Western countries is a good example of what amounted to emerging culture at the time. Some may consider that the hippie culture has now become residual, is outdated, but still influencing current Western culture. Jihadism as new forms of Islamist militant movements in the twenty-first century, or ecosustainability as an environmental movement, are other examples of new emerging ideological forms of culture, both with their varying national and local overtones.

In understanding varying approaches to conceptualizing culture, it is also important to acknowledge the significant gap between popular/public versus academic discourses on culture (see Grillo 2003; Steger 2014). In Grillo's words:

> . . .the disjunction between vernacular, common sense and essentialist conceptions of cultures which dominate public discourses and theorized and intellectualised accounts of academics and functionaries (postmodernist or modernist) with their very different social and political agenda has never been greater. Grillo (2003, p. 163)

Grillo makes this argument in the context of his call for a better understanding of why cultural essentialism is having such a popular grip in current times. Even though essentialist interpretations of culture are commonly dismissed in academic discourse to be no more than a "figment of the mind" (Wikan (1999) quoted in Grillo (2003, p. 158)), they are nonetheless real under currents which can undermine or make any political agenda. Brexit and President Trump's election testifies to the existence of popular essentialist sentiment toward British and American culture which are real, alive, and kicking and that neither politically nor academically correct agenda could predict.

The Franco-Lebanese and renowned essayist Amin Maalouf (2009), greatly concerned about the "imaginary certitudes" promoted by cultural essentialists, advocates a new role for culture which he equates to knowledge of cultural diversity for all, with no value distinction between high and low culture. He believes education urgently needs to promote this kind of inclusive global culture as "intellectual and moral tools" for global survival in the twenty-first century, in his words:

> Today the role of culture is to provide our contemporaries the intellectual and moral tools which will allow them to survive – nothing less. (Malouf 2009, p. 203)

Having discussed some different ways of approaching an understanding of culture and its uses, consideration is given next to the impact of globalization on culture. (Traduction from the author of the French original: 'Aujourd'hui, le role de la culture est. de fournir à nos contemporains les outils intellectuels et moraux qui leur permettront de survivre – rien de moins' Malouf (2009, p. 203).)

## Globalization and Culture

Globalization, alike culture, is very much a disputed and slippery concept, too complex Steger (2014) argues "to force into a single analytical framework." It is not the privileged study of any discipline. It concerns and challenges all disciplines.

However, there is consensus, at least in the literature, over the fact that *cultural* globalization (if not other global processes) intensifies social interactions across cultures, as mentioned earlier, and that current, as opposed to earlier, forms of global cultural interactions are of a new order.

This new order is the result of the increased global flow of populations, involuntary (i.e., forced migration) or voluntary (e.g., international trade and tourism), of larger access to mass media and of new technologies of communication. Appadurai (1996, p. 28) qualifies this new order as being "filled with ironies and resistances," meaning that the impact of globalization on culture is experienced with hiccups and contradictions by nearly every country on the planet. One reason for this is that, although globalization has an undeniable homogenizing effect on culture, it is always experienced in, and affected by, local contexts. Thus, it can reinvigorate local cultural practices rather than debunk them, especially when cultural globalization is perceived as a threat or produces forms of cultural hybridization, two different processes Robertson (1997) calls processes of "glocalization." For the postcolonial theorist Homi Bhabha (1994), there is however ever and only cultural hybridity, especially from the minority perspective. He warns not to read the representation of difference as "the reflection of pre-given ethnic or cultural traits set in the fixed tablet of tradition" (Bhabha 1994, p. 2).

The tension between the homogeneity versus heterogeneity/hybridity/and diversity of culture is a common popular concern, in particular in relation to cultural globalization. At the core of this tension is the fact that cultural globalization is perceived to be largely the Westernization, if not the Americanization (Appadurai (1996, p. 32) notes that cultural globalization should include not only the Americanization of other cultures. It should also consider other instances of dominance of a culture over another, as in the case of the Japanization of Korean culture or the Russianization of the people of Armenia and of the Baltic Republics.) of the world's cultures, creating a palpable hierarchy of cultures, especially in terms of the economic edge the production and diffusion of global culture can give.

Marin (2010) dates the start of the cultural Westernization of the world to the Crusades and the first discoveries of Africa and America. More to the point, he argues that these prompted the start of globalization of the economy, leading overtime to the imposition of the capitalist (neoliberalism) model as we know it today, worldwide.

Alike culture in a national context, cultural globalization has tangible and more intangible dimensions. The proliferation on the planet of American fast-food chains like Kentucky Fried Chicken, McDonald's, or Starbucks, what Rizer calls (1993) generally "the McDonaldization of society," are examples of tangible cultural global impact. Another example is the increase of the "migrant presence" (Martin 1985), which involves the increased visible presence of the culturally different others in people's neighborhood, at least in Western countries. This rapprochement of cultures as lived reality, or factual multiculturalism, can promote more understanding and appreciation across cultures, as well as more desire for the supremacy of the dominant culture. Hage (1998), for example, explored what he called "fantasies of white supremacy" in an Australian context, showing the limits of multiculturalism when it only tolerates cultural difference rather than embraces it.

Adding to the concept of "the migrant presence" is the notion of the "deterritorialization of culture" as the disembedding of social relations (see Giddens 1990; Papastergiadis 2000), that is, the fact that culture and space (as in countries) are no longer necessarily linked. The Irish cultural presence in New York, the Turkish cultural presence in Germany, or the Indian cultural presence in South Africa are examples of the deterritorialization of culture that is of cultural expression which has moved outside its original physical environment to new foreign contexts. The term "reterritorialization" is used when the migrant cultural community is deemed to have become part of the local culture.

Finally, the role of international mass media, satellite television, and other new technologies of communication are ought to be mentioned as they are commonly considered to be the primary cause

of global mass culture, this because of the common images and discourses they produce and diffuse worldwide. The label "mass culture" refers to the behavior, ideas, and values that are produced from common exposure to the same media.

Scholars disagree over the level of impact of global mass media on individuals and societies. Sparks (2000), for instance, argues that no such mass media can ever be so global in managing to reach a majority of people on a world's scale, even though more and more people have access to new technologies, such as Internet, but because it would have to constantly do so in a high number of languages. Kraidy (2002) argues that there are many alternatives to "media imperialism" on local levels and further that even when mass media and new technologies produce cultural hybridity, this very hybridity can defy structures of power. A point reinforced by Magu (2015):

> . . . cultures are not 'victims' of globalisation or the proliferation of mass media. Cultures actively adopt and integrate globalization's technological artefacts. Globalization's positive effects are dynamic and span cultural interactions and permeate structures of authority at personal, national and global levels. (Magu 2015, p. 630)

Appadurai (1996, p. 53) suggests that imagination has acquired a new role and power in social life, due greatly to the impact of global mass media on individuals. He argues that more and more ordinary people are provided with "a rich, ever-changing store of possible lives," a choice which can both empower or disrupt. Imagination, he further argues, which in the past was part of the creation of art, myth, and legend, is now part of the mental work for "the construction of imagined selves and imagined worlds":

> More persons throughout the world see their lives through the prisms of the possible lives offered by mass media in all their forms. That is, fantasy is now social practice, it enters, in a host of ways, into the fabrication of social lives for many people in many societies. (Appadurai 1996, pp. 53–54)

The freeing of individual imaginations intrinsic to global cultural growth no doubt impacts on the construction of self and identity. It also increases the opportunity for new collective transcultural ideologies to develop based on imagined worlds. A particular target for ideological reconfiguration is the realm of religious beliefs, beyond the scope of this entry to consider, though a key feature to a deep understanding of global, national, local, and individual culture making.

The many shapes and turns that cultural globalization can take are explored further in a final section which focuses on the important role language plays in relation to culture and globalization.

## Language, Culture, and Globalization

Language, culture, and communication are intimately linked as humans cannot help but categorize and express their experience of the world through linguistic and cultural filters (Kramsch 1998; Liddicoat 2009). However, the relationship between language, culture, communication, and globalization is highly complex.

Firstly, the majority of people on the planet, roughly 80%, are multilinguals (Blanchet 2016). Multilinguals use the various linguistic and cultural filters that they have at their disposal to communicate in variable and creative ways, constructing unique subjective realities and identities in the process (Kramsch 2009). Secondly, from a global standpoint, the relationship between language and culture is increasingly no longer one to one but one too many. That is, one language can express and represent different cultures, as in the clear cases of world languages such as English, Arabic, French, and Spanish.

For instance, Mexico and Central and South American countries share Spanish as their common dominant language, but they are all inhabited by different indigenous cultures (and languages) which have mixed with different versions of Hispanic nationalist history and culture. In a similar way though reversed process, migrants to a new country in time express the culture(s) of their original country through both their first language(s) and the new language they learn in their host country. In the current global era, the increasing number of individuals with complex linguistic and cultural biographies will keep intermeshing both.

Beyond the increase of linguistic and cultural hybrids among individuals, it is also important to note the impact of globalization on linguistic diversity on a collective level, that is, to note how languages are standing and evolving in relation to each other and how this in turn affects both cultural and biodiversity.

Two decades ago, Weber (1999) identified what he called *The World's 10 most influential languages* using as criteria: the number of native speakers, of secondary speakers, the number of population and countries using the language, the number of major fields using the language (science, diplomacy, etc.), the economic power of countries using the language, and socio-literary prestige. His classification, arguably still valid today, ranks the most influential languages internationally in the following order: English, French, Spanish, Russian, Arabic, Chinese, German, Japanese, Portuguese, and Hindi/Urdu.

English is the modern world lingua franca, it is ahead of all other world languages in terms of its global impact; however only one out of four users of English in the world is a native speaker of the language (Crystal 2003). Englishes, such as Chinglish or Indian English, have globalized English by importing into it cultural features originally foreign to it. English and Englishes as the dominant lingua francas contribute greatly to the reduction of linguistic diversity on the planet, but it has not erased multilingualism as the dominant feature of the logosphere (Krauss 2007), that is, the global web of cultural and linguistic diversity. It is for this very reason that the All-Party Parliamentary Group on Modern Languages in Britain warned in 2014, in its *Manifesto for Languages*, that English is necessary but not enough, not only for the conduct of international trade but for many other sociocultural and political benefits:

> English is an important world language, but the latest cutting-edge research shows that, in the 21st Century, speaking **only** English is as much of a disadvantage as speaking **no** English. (APPGML 2014)

The ten global languages mentioned above are among the only few hundred languages commonly taught through education systems, out of the about 7000 languages spoken in the world today (Paul et al. 2016). It is estimated that about half of these will be extinct by the end of the twenty-first century, an alarming loss if one considers the correlation between linguistic diversity and biocultural diversity.

Indigenous languages as smaller languages tend to struggle the most in surviving the force of global languages, and of globalization generally, their loss leading to the loss of biocultural knowledge on local natural environments (Robertson 2014). Evans (2010) further argues that the loss of indigenous languages leads to the loss of invaluable knowledge on how language works as a feature of humankind and on its role in human cognition. However, their relationship to the dominant and to other languages at a local level is complex, involving variable sociopolitical and historical factors, as well as local communities' choices.

What can be argued is that language rights for all language minorities (not only indigenous minorities) matter. The right to use one's mother tongue in particular is an existential issue, closely linked to one's identity and sense of self, hence of one's well-being. Further and to the point, in the complex domain of language rights, especially when it involves minority groups, Robertson (2014, p. 935) warns against "unhelpful dichotomies between modern/traditional and indigenous/non-indigenous" and further "to privilege cultural and linguistic 'nativism' and insularity over transcultural contact and exchange."

Tensions between the important gain in maintaining linguistic diversity and their associate culture(s), for existential reasons and in terms of safeguarding world knowledge/heritage, and the equal need for successful intercultural communication, facilitated by the use of English (and other lingua francas), and the watering down of cultural difference, are not easily solved.

## Concluding Remarks

To understand the complexities of issues at stake in cultural globalization, it is useful to understand first the nature, purpose, and uses of culture, as proposed in this entry. In summary, the nature of

culture is dynamic, its purpose is to create meaning and share it, and its uses intermix with matters of power, history, personal subjectivity, and collective identities, as well as other variables such as gender and social categorization. It is hard to contain culture within clear boundaries, and at the same time it is hard to dismiss its existence.

Cultural globalization can both increase and decrease human interconnectedness. This is because the global unleash of cultural information requires an increased capacity to make and negotiate meaning out of information about and across cultures. The negotiation of cultural meaning is complex; it involves the ability to *communicate* successfully across cultures (Wolton 2003). "Cultures" as abstract entities do not communicate between themselves, people do (Scollon and Scollon 2000), and people do not communicate in a vacuum. In the current global era, people communicate through increasing complex linguistic and cultural filters. When they do, not only language and culture come alive but also world, national, and local history as well as personal histories, with layers of positive outcomes but also unresolved issues. In order to maximize the positive impacts it can have, cultural globalization calls for the ability to understand how the big and small pictures interact, connect, or not. It calls for discernment and the choice of collaboration over power in approaching difference.

The active support of, and engagement with, linguistic and cultural diversity helps the growth of positive cultural globalization, but it is not enough. After all, as noted by Lo Bianco (2001, p. 458), there are many polyglot and multicultural fanatics, and conversely there are many "culturally sophisticated monolinguals."

It is the new work of the imagination as social act, as posited by Appadurai (1996), which will keep playing a major role in global cultural processes, feeding greatly, though not exclusively, from electronic resources and opportunities given to it to access cultures. However, the empowerment of the world imagination is double edged. It can create new patterns of connection across individuals and collectivities leading to increase positive international interconnectedness. It can also disconnect from the real as cultural globalization tends to facilitate more virtual than face-to-face contact, giving free range to imagined subjectivities. Globalization and culture will keep interacting in nonlinear and unpredictable ways. It will keep navigating between universalizing and localizing tendencies.

# Globalization and Democracy

Kathleen C. Schwartzman
School of Sociology and Center for Latin American Studies, The University of Arizona, Tucson, AZ, USA

## Synonyms

Global contributions to regime shifts; International influence on national political regimes; International impacts on national forms of representation; Political regime changes from an international perspective

## Introduction

Democracy is one of several political forms that link civil society and the state. This essay focuses on the role of global dynamics in the emergence of democratic regimes. Conceptualizing globalization in historical terms offers the possibility of describing transitions to democracy including those from: monarchies, oligarchies, fascism, bureaucratic authoritarianism, colonialism, and socialism. This far from exhausts the scholarship on democracy, but due to space constraints, this essay excludes work on democratic collapses and coup d'états, as well as extensions of rights and franchise to citizens previously excluded on the basis of property restrictions, race, or sex. Likewise, the myriad "types/definitions/measurements" of democracy

are omitted. In short, this is a sample of cases in which global events created conditions for democratization.

## Globalization

Today's writers often invoke "globalization" to refer to the recent vertiginous growth of global commodity trade, foreign direct investment, and financialization. And, armed with this interpretation, they argue that globalization will lead to democracy – that free (or competitive) economic markets are associated free political competition. There is minimal consensus about the mechanism. It could be Lipset's (1960) classic notion of economic growth and the rise of a middle class, or it could be that technology allows ideas to spread. Somewhat problematic, however, is that the "open-market democracy" theory is silent about the episodic coexistence of "capitalism and authoritarianism." Eichengreen and Leblang (2006) judge that while there are a multitude of studies asserting both positive and negative relationships between democracy and globalization, there are also questions about their respective methodologies and the robustness of the findings. Their contribution, in addition to an exhaustive survey of the literature, is an empirical analysis of the two-way causality.

Viewing democracies from a global perspective means moving beyond the notion that political transitions can be understood solely in terms of endogenous factors such as a religious tradition, level of economic development, income equality, civic culture, or education. It also means, as Wallerstein argues (1992) going beyond explanations that are overly episodic, event-oriented and insufficiently structural or cyclical. Likewise, we must expand the concept of "external" beyond acts of foreign imposition. A global impact might take the form of an exogenous commercial shock, external forceful imposition, conspiracy, or "coercive persuasion." A world-system notion of globalization – an integrated world economic system beginning more or less in the 1500s – offers possibilities for a more inclusive review.

## General Principle

At a minimum, transitions involve the displacement of one ruling group. Democratic transitions are distinguished from royal successions or civil wars in which the successful contender rules utilizing the same political institution. Transitions to democracy entail a process in which one ruling group is displaced by another [either a different fraction of the elite or a previously marginalized rural and/or urban workers], and the victorious contender installs a new democratic political arrangement. The global context emphasizes the exogenous environment which offers challenges: depriving existing rulers of their source of economic or military power, enhancing the capacity of a previously disadvantaged elite fraction, or augmenting the organizational capacity of a subaltern population. The comparative advantage of democracy is not just that rulers are elected to represent the sovereign will of the citizens but also that democracy is an organizational form in which different fractions of the elite can arrive at a compromise (Przeworski 1985).

This essay presents brief descriptions of several countries grouped into five prototypes which demonstrate the globalization – democratization linkage. They range from the weakest global effect (an external commercial impulse) to the strongest (imposition through occupation). Between these extremes are cases in which global factors destabilized pre-democratic regimes or constituted an "incentive" for democratization. These are not historical conjunctures treated in an ad hoc, ex post facto fashion; rather they are exemplars of the effect of world-system shifts on democratization. They are presented more or less chronologically.

### Commercial Impulse

Perhaps the most cited work is Barrington Moore's *Social Origins of Dictatorship and Democracy* (Moore 1966). This classic work inspired replications, extensions, and modifications – all studying history from a social structural and power-conflict perspective. For Moore, democracy was the political outcome of one of the three routes to economic modernization. The

particular route to the modern world depended on the existing social structure and the resolution of the exogenous shock. The English transition from monarchy to a Western form of democracy was the political expression of conflict between a rising industrial elite and an entrenched and perhaps even feudal agrarian elite. For Moore, the pivotal factor is an influential bourgeoisie with economic autonomy from the landed aristocracy or the government.

The challenge was commercialized agriculture. Landed nobility could respond to this challenge by (1) leaving the traditional organization of agricultural communities intact, or (2) reorganizing to enter into the commercial market. Both the peasantry and the agrarian aristocracy must undergo a transition from nonspecialized and non-commercialized to specialized and commercialized agriculture. The English case involved the enclosures and the elimination of the peasantry.

For the commercial impulse, Moore cites the existence of markets in nearby towns paired with adequate transportation for goods. This could be considered the seed of the spread of the market economy changing power relationships among classes. In Moore's text, we find less attention to the origin of the commercial momentum. Certainly it came from the Middle Ages "global" wool trade which had made large houses very wealthy. In the 1250–1350 periods, wool trade was the backbone and driving force in the English medieval economy. Thus, the chief carriers of what was to be a modern England were men of commerce in both the countryside and the towns. The successful wool trade had spinoffs in manufacturing, finance, and the commercial sector that transported wool to countries outside of the United Kingdom. It is reasonable to say that the "global" export commodity, not just the presence of townships requiring agriculture from the countryside, was the global event which created conditions for democratization.

An excessive dependence upon export commodities contributed to democratization in Brazil. This may seem like an odd pairing with Moore, but it also illustrates the political consequences of globalization. Coffee was Brazil's commodity of global integration. Brazil had an incipient industrial sector, but the ruling oligarchy held a strong anti-industrial sentiment. Vargas' successful coup in 1930 replaced the oligarchy with a new political form including an Electoral Code, a secret ballot, proportional representation, and the franchise for women. The global commercial dynamic was the Great Depression. Between 1929 and 1931, the price of coffee plummeted; Brazil's foreign trade fell 37 % in volume and 67 % in value; the gold reserves disappeared by the end of 1930, and the exchange rate reached a new low. Disenchantment with the agro-export oligarchic model had reached a new high (Burns 1980). This was the commercial impulse for the overthrow of the oligarchy and the establishment of democracy.

G

### Territorial Expansion

Both China (1911) and Portugal (1910) shifted from monarchical to democratic rule at the beginning of the twentieth century. Certainly the internal dynamics and pressures for a republican form of government were distinct. However both monarchies were weakened and destabilized through British territorial expansion.

The Qing dynasty was unsuccessful in facing numerous challenges. At the end of the 19th century, the empire was weakened by international aggression, including, but not limited to, losing Hong Kong to the British, acquiescing to foreign concessions, and losing Taiwan following the Sino-Japanese war. Royal attempts to salvage the empire by modernizing the government and military bureaucracies were insufficient to placate domestic unrest. The Revolutionary Alliance, successful in 1911, rejected the King's constitutional monarchy "compromise" and declared the Republic of China. The 1897 foreign "scramble for concessions" in China was a global factor in the emergence of the republic.

Portugal, in the 1900s, was a monarchy. The loss of its Brazilian colonial monopoly (as the quid pro quo for English assistance in minimizing the effect of the Napoleonic invasion), followed by Brazilian independence in 1822, undermined the foundation of its absolutist monarchy. Although the Crown treasury was substantially depleted, revenue from the African colonies

allowed for some primary accumulation. In the European scramble for Africa, Portugal lost parts of its "claimed" territory to France and Germany. The 1890 British Ultimatum was the most costly. England demanded that Portugal relinquish its lands – between its African coastal colonies of Angola and Mozambique – or lose diplomatic relations with Britain followed by the probably use of force. Unable to cover its debts, Portugal declared bankruptcy in 1892. In 1898 an Anglo-German convention anticipated an economic partitioning of the customs revenues of Angola, Mozambique, and Timor, as collateral for a loan. And there was the possibility of a political partitioning. In 1910 the monarch was overthrown and replaced by the First Portuguese Republic.

The Great Depression of 1873–1896 unleashed a new age of imperialism in which core nations and contenders launched a phase of territorial expansion. These global events aided the anti-monarchical revolts in China and Portugal, creating conditions for democratization.

### Occupation and Democracy

Perhaps the most notable transition by occupation is post-WWII Japan. Following the Japanese surrender in WWII, democracy was imposed under the control of US troops. Gen. Douglas MacArthur, Supreme Commander for the Allied Powers arranged for a general election, suspended laws which restricted political, civil, and religious liberties and extended the franchise to women. The United States also provided billions of dollars of food aid. Washington ruled albeit through Japan's prewar government – the national legislature, the cabinet, and the bureaucracy.

American army and navy officers, partnering with Japan's pre-WWII government, drafted a Japanese constitution embodying elements of the British system, the American Bill of Rights, and some economic freedoms resembling those found in the US New Deal. Its success, some have argued, rested on the moral and legal legitimacy in the eyes of many shareholders: Americans, Allied powers, Asian neighbors, and a majority of the Japanese.

The global dynamic here is clear: following a global war and foreign occupation, a prefabricated institutional democratic structure was imposed.

### World-System Restructuring and Shifting Hegemons

The evolving nature of globalization was the stimulus for the democratic transitions in Greece, Spain, and Portugal. Despite internal variation in resistance to their authoritarian regimes, and varying success in attempts to reform or overthrow them, all three transitioned to democracy in the 1970s. Poulantzas (1976) explains these political transitions from an "imperialist world context." The new democratic forms were political accommodations to the shifting economic balance among the core nations. This exogenous global restructuring contributed to the endogenous growth of new classes, new class struggles, and a new balance of sociopolitical forces (Arrighi 1985; Logan 1985).

In the case of Portugal, the power bloc that ruled from 1928 until the 1974 revolution represented a coalition of colonial capitalists, foreign investors, and landed aristocracy. The colonial fraction functioned as a commercial and financial intermediary for foreign nations which exported capital to the African colonies for extraction of raw material. Portugal remained relatively rural with a small urban labor force.

This arrangement was upset by a global shift in the origin and destination of capital flows. In response to falling rates of profit, core countries directed a larger share of foreign investment away from resource extraction and toward a productive industrial sector. Although profits were mostly expatriated, such investments boosted the size of the Portuguese working class. Overtime, the European investment share in Portugal surpassed that of the United States. The two shifts (country source and sector destination) of global integration diminished the power of coalition represented in the authoritarian regime. Resistance to a renegotiated pact among fractions of capital within the authoritarian regime culminated in a complete overthrow and the establishment of a democratic form in 1974.

The global shifts intensified the internal struggles among fractions of the bourgeoisies in Greece, Portugal, and Spain. The triumph of democracy represented a redistribution of the balance of forces within the power bloc in favor

of the fraction of capital that veered toward the Common Market at the expense of the fraction affiliated with the United States. For Poulantzas, representative democracy (unlike authoritarianism) is that form of state which allows various class fractions to negotiate and resolve differences. And, the shift in the balance of power among capitalist fractions also included a place for the now more numerous and organized working classes.

### Corralled Transitions

In the 1980s and 1990s, a number of countries rejected their dictatorial rulers and embraced democracy. This period includes not only the transitions in Latin American but also in South Africa and in the former Soviet countries to name a few. The particular form of democracy adopted in this wave should be referred to as polyarchy, distinctly different from popular democracy or a ground up, invigorated civil society (Saul 1997). Rather than accentuating the will of the people and the common good, the polyarchic version of democracy stresses the institutional arrangements for selecting representatives who will make decisions.

The global impetus for this wave of democratic transitions was modified transnational production. It had evolved from an articulation of precapitalist modes of production with capitalists ones, to a single production system. Certainly technological innovations facilitated this global restructuring, but it would be erroneous to identify technology as the causal factor.

Robinson (1996) describes the link between the new economic restructuring and the new political form as follows. Transnational global production accelerated the breakup of precapitalist communities and contributed to labor displacement. In many countries, transnationalism gave rise to increased political mobilization, at times seemingly pro-socialist. Historically grassroots mobilization had been repressed by right wing dictatorships and US "client regimes." These regimes were acceptable to the United States. Occasionally this involved US military campaigns. Between WWII and the end of the Cold War, the United States employed military force across its borders more than 200 times. Intervention involved direct military force, counterinsurgency, as well as covert operations. Strategic alliances with authoritarian regimes accompanied U.S. Cold War concerns but more importantly were economic interests in the Third World, viz., access to raw materials, markets, and labor power.

Robinson supports his argument with the cases of the Philippines, Nicaragua, Chile, and Haiti. The impetus for the political transformation originated in the fact that those authoritarian regimes were no longer able to contain the popular movements. Polyarchy was judged best for mitigating the social and political tensions produced by the previous elite-based and undemocratic regimes and by the dislocations associated with modernization. Authoritarianism and dictatorships had become fetters to the emergent patterns of international capital accumulation. The United States withdrew its support from previously supported military dictatorships or authoritarian client regimes, such as Marcos and Duvalier. They no longer seemed to be guarantors of social control and stability.

Polyarchy represented the replacement of coercive control with consensus. This was reflected in the US government's diminishing use of the CIA and increasing use of the National Endowment for Democracy (NED). In 1983, Carl Greshman, president of NED argued that in a world of expanding communication, something other than force was needed to defend the US national security. The United States began promoting "democracy" as a way to relieve pressure coming from subordinate groups demanding change.

Various US government agencies disbursed funds, overtly and covertly, to organizations that assisted in building up institutions of political and civil society. NED funded activities such as new women's organizations and publication of a monthly magazine, trade unions, political parties, and churches. All were in an attempt to steer them toward the international order.

The transitions unfolded over time. The CIA came to support Mobutu in the Congo when he carried out his 1965 coup. He was part of the U.S.' anti-communist defense. Lewis (1997) writes that the United States neglected several opportunities

to press for reform and continued to help put down rebellions and refrained from encouraging Mobutu's retirement following a 1991 army mutiny. Only in 1997 did he become, in the words of a White House spokesman, a creature of history.

Whereas resource extraction and earlier forms of globalization allowed for the articulation of a myriad of political forms, contemporary globalization – a single system of economic production – necessitates political symmetry. Robinson offers an insightful description of the global events that created conditions for democratization.

## Conclusions

The global and local are intimately linked. The analysis of democracy must move beyond the idiographic and beyond abstract notions of culture, religion, or desire for freedom. There will not be an "end of history" based on a unilinear or nonreversible global march toward democracy. Rather, democratic systems (emergence, stability, and collapse) are the consequence of global historical processes: expansions, contractions, and shifts in hegemonic leadership have political consequences for nations.

# Globalization and Energy

Jan-Erik Lane
Public Policy Institute, Belgrade, Freiberg, Germany

## Introduction

The energy implications for country positions in the global system of states and nations have been much debated in the discipline of geopolitics. Here, one often encounters simple assumptions about what control over energy resources entails for state power and influence. But the large attention paid to energy today has two sources or reasons, namely:

1. Fear of a global *Hubbert peak* for the consumption of fossil fuels, especially oil
2. The negative effects of rising energy consumption upon the environment, especially climate change: global warming $>2°$

Whereas the first concern has eased considerably, the second one just keeps going up in

political relevance, comprising a lot of difficult and complicated policy issues. The common back ground here is the immense augmentation of energy consumption during the latest decades when the emerging economies managed to catch-up with the advanced capitalist economies, focusing more and more upon conspicuous consumption that is highly energy consuming. The environmental worries about the sharp rise in energy production and consumption pointed at several ecological menaces, but the center of interest has become the emissions of greenhouse gases stemming from anthropogenic sources in the economic, especially the burning of fossil fuels and cement constructions. Thus, energy is now the main topic in the globalization process; how to decarbonize the world economy without losing economic momentum?

## Energy and Social Systems

The concept of energy is complex, identifying several forms of energy. In general, energy is the capacity to do work. Thus, it is a central element of all social systems, from advanced economies to simple households. It is of course vital in politics and warfare. In the natural sciences, Einstein made energy the core of the universe with his famous formula, equating mass with energy. For the social sciences and economics, the importance of access to energy sources has increased with industrialization, urbanization, and the port-industrial society. The process of globalization has further underlined the centrality of energy sources and energy consumption for economic well-being and public policy. With more and more humans coming on the stage and people seeking higher standards of living, the demand for energy has exploded the recent decades. And stylized projections for the coming decades talk about another doubling of demand. The energy sector is in many countries the most important one in the economy, but also in poor countries the access to energy sources is said to be extremely important, for instance, for agriculture and access to water, sanitation and light.

Now, following the basic laws of physics, energy is indestructible. This entails that all now existing energy came forth on the Big Bang. However, energy can change form. Which is the key to understand why energy resources of whatever kind are so important to humans and their social systems, especially when globalization pushes up demand in an incredibly quick fashion? Energy can only become inactive in a state of entropy, which could be the final end predicament of the universe (cooling hypothesis or total entropy).

The basic forms of energy for the globalization period and its societies, rich or poor, comprise;

- Fossil fuels: coal, oil, natural gas
- Shale oil and gas: shale rock
- Traditional renewables: charcoal, peat, waste
- Modern renewables: solar, wind, geothermal
- Nuclear power: fission or fusion

Some of these sources of energy result in the emission of gases when consumed, the greenhouse gases (four to seven kinds), of which the $CO_2$:s constitute the largest bulk, although also methane is highly relevant in the globalized world due to the melting tundra and ice pockets under the oceans. Thus, we arrive at the crucial links, outlines the well-known Kaya identity model – $CO_2$:s = GDP per capita × population × energy intensity of GDP × carbon intensity of energy (Kaya and Yokoburi 1997):

1. Economic development or growth – energy consumption
2. Energy demand – greenhouse gases
3. Greenhouse gases – global warming at degrees X

The exact nature of these links is not fully known today, constituting one of the most important areas of new inquiries in the natural and social sciences. It is globalization that puts (1), (2), and (3) at the forefront, because the world economy has grown at a large average rate since 1945, acceleration actually in the last 35 years with the awakening of giants like China, India, Indonesia, Brazil, and Mexico inter alia.

## Two Energy Problematics Become One

In the controversy between ecologists and cornucopians that played out since the Ehrlich-Simon bet (Simon 2003), there was a hope among the former that the Hubbert peak oil – scarcity – would help solve the green damages from fossil fuel production and consumption. At the same time, the cornucopians with Wildavsky (1997) and Lomborg (2007) ridiculed the ecological concerns of environmentalists, stating that there was no problem, only empty rhetoric. Both camps failed to present the correct analysis. On the one hand, the Hubbert peak is a figment of the imagination, as fossil fuels are truly abundant. On the other hand, planet Earth faces severe environmental damages, including the lethal threat of climate change.

The ongoing shale rock revolution eliminated all Hubbert peaks, also for the USA. With huge deposits around the globe of shale rock, fossil fuel prices will stay low for a long time, which puts pressure upon the large scale development of modern renewables. Yet, the easing of energy prices due to falling oil prices just makes the other problematic more urgent, i.e., greenhouse gases and global warming.

## COP21 Process in Three Steps: Decarbonization

The governments of the world have finally come around to accept that climate change is not a positive for mankind and planet Earth. No one with certainty how dangerous global warming may be or what are the driving mechanisms behind it, as well as the possibilities or probabilities of positive and negative feedback lopes. Despite that climate change involves the well-known uncertainties and risks of economist F. Knight, 193 states have been committed to the objective of a major decarbonization process, which if implemented would completely alter the present patterns of energy production and consumption. The COP21 covers three stages of decarbonization:

- Phase One up to 2020: halting of the growth of emissions typical of the entire industrial era
- Phase Two up to 2030: reducing the $CO_2$ emissions by 40%
- Phase Three up to 2080: more or less elimination the $CO_2$ emissions

The task of the social sciences and economics is to inquire into the implementation of these goals as well as help devise management strategies that are conducive to the realization of these goals. Energy will be, I submit, the crucial variable in these COP21 unfolding games. Why is energy so important for globalization and the Earth's ecology?

## Energy Consumption Today

Not only may all forms of energy be measured, but all these measures are translatable into each other – a major scientific achievement. One may employ some standard sources on energy consumption and what is immediately obvious is the huge numbers involved – see Fig. 1.

Examining Fig. 1, one understands the size of the task of decarbonization. Complete decarbonization would mean the elimination of the energy consumption of fossil fuels and traditional renewables. This is a herculean task, impossible simply. But the mix of energy usage will change during this century toward more of carbon neutral energy sources.

## Future Energy: COP21 Breaking Crucial Links

When calling for decarbonization of economies in the widest sense, the COP21 envisages that decarbonization can be maximized with the constraint of continued economic development or growth. But is it really true?

Hitherto GDP and energy per capita have been most strongly connected. See Fig. 2 and GDP and GHG have also been strongly linked – see Fig. 3. But the COP21 process claims we can have declining GHC:s and augmenting GDP? True? It all depends upon the evolution of energy consumption.

Figure 1 shows that the richer a country, the more energy their inhabitants use. This entails that

**Globalization and Energy, Fig. 1** First global decarbonization policy link; GDP – energy per capita: $y = 0.26x$, $R^2 = 0.81$. (Source: see references)

**Globalization and Energy, Fig. 2** Stylized energy projections

total energy consumption will be a straight function of affluence. Most of this energy comes from the burning of fossil fuels, as shown in Table 1.

The stylized projection for energy consumption in the globalized world speaks of unbelievably increases in the next decades to come, responding to the hopes for high economic growth in emerging economies and decent rates in mature ones. The objection to these predictions is simply that they fall outside of the COP21 approach that now starts.

There is much talk about moving toward GDP growth with little or no increase in carbon energy. From a micro-point of view, this is feasible but hardly from a macro-point of view, including the total aggregates for the globe. India, for example,

**Globalization and Energy, Fig. 3** Global energy intensity

**Globalization and Energy, Table 1** Energy consumption 2015 (million tons of oil equivalent)

| | Total | % |
|---|---|---|
| Fossil fuels | 1,1306.4 | 86.0 |
| Oil | 4331.3 | 32.9 |
| Natural gas | 3135.2 | 23.8 |
| Coal | 3839.9 | 29.2 |
| Renewables | 1257.8 | 9.6 |
| Hydroelectric | 892.9 | 6.8 |
| Others | 364.9 | 2.8 |
| Nuclear power | 583.1 | 4.4 |
| | 1,3147.3 | 100.0 |

Source: BP Statistical Review of World Energy (2016)

cannot do without coal or even charcoal (Ramesh 2015). Consider some of these stylized projections in Fig. 2.

If these predictions, and there are several like these, become true, the COP21 will fail miserably, because the predicted future in Fig. 2 entails more of carbonization. The energy producers speak of "energy needs," but for ordinary people, the environment comes first, at least when they do not act myopically.

Now, the existence of an energy negative relation between GDP on the one hand and GDP energy per GDP unit – energy efficient at macro-level – has raised to hope of a decoupling of the close link GDP energy. According to this inverted curve, energy per GDP unit slopes downward the richer a country becomes. However, this inverted curve in Fig. 3 does not entail its suggested entailment, because people simply use more and more energy, often in conspicuous consumption, and the number of people increases.

Now, we move to the core of the problems for the twenty-first century and the COP2, the second link between GDP and GHC:s.

## Decentralized Implementation or Global Management Strategy

People who argue for more and more energy put their hope for decarbonization with the uncoupling of GDP and GHG:s or $CO_2$:s. However, the present evidence does not at all support this claim – see Fig. 4. It shows that total $CO_2$:s follow GDP. As the more affluent the world, the more $CO_2$:s.

The hidden intervening variable here is of course energy or the needs for electricity allover in society and a variety of transportation needs.

Again, the hope for a decoupling of the link in Fig. 4 hinges on declining GHG – GDP ratios: the so-called environmental Kuznets' curve. Fig. 5 shows an example of such an equation for 2014 data on GDP and $CO_2$/GDP ratios in the countries of the world, i.e., cross-sectional evidence.

The findings in Fig. 5 of a cross-sectional evidence type render little supper for this hypothesis. And the entailment about a future declining GDP-$CO_2$ link does not hold.

**Globalization and Energy, Fig. 4** Globalisation and emissions: Global GDP-$CO_2$ link: $y = 0{,}80x + 5{,}96$; $R^2 = 0{,}97$ (N = 59)

**Globalization and Energy, Fig. 5** An environmental Kuznets' curve (EKC): GDP – $CO_2$/GDP in 2014

## Conclusion

Energy in the twenty-first century will receive lots of political attention. Without energy, no work in our social systems. And work is the basis of affluence. Crucial issues about globalization and energy involves the following:

- Has shale rock finally killed the idea of Hubbert peaks globally and in the USA?
- Can decarbonization be accomplished within the COP21 approach?
- Is it possible to double energy consumption at the same time as decarbonization?

Moreover, one may ask: will traditional renewables be phased out?

- Can nuclear power make a comeback?
- Is fusion power feasible in this century?
- Can climate change be brought under some control by decarbonization policies?

It is readily admitted that fusion power would solve the problematic of energy and greenhouse gases as well as GDP growth and GHG:s in one strike. Unlimited clean energy would be available somehow from the most abundant element in the universe viz. hydrogen. But this is not likely.

When talking about energy in the twenty-first century, we speak about probabilities. And this calls for humbleness, caution, and environmentalist policy-making. After all, implementation of policy objectives like those of COP21 is fraught with difficulties (Pressman and Wildavsky 1984; Wildavsky 1987). And the hope for a sustainable global economy according to Sachs (2015b) is probably just utopian. The West is going to have to pay a lot for decarbonization in the Third World, as recommended by Stern in his idea of a Superfund (2007, 2016).

# Globalization and Filial Piety

Julian C. H. Lee
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Synonyms

Asian values; Respect for elders

## Introduction

Filial piety, or the respect for and care of parents, is regarded as a key social value in many societies. This is so especially in Asia where it is widely regarded as a central "Asian value." The shared nature of this value in Asia is said to apply irrespective of ethnic and religious differences. Within Asia, filial piety is especially associated with East Asia, where the written character for filial piety is shared in Chinese, Korean, and Japanese writing. In Mandarin it is pronounced *xiao* and is constituted by a top character which is that for *lao* (old) and a lower character *zi* (young). "When combined to constitute *xiao*," writes Charlotte Ikels, this "ideograph communicates multiple messages of which the officially preferred one is that the old are supported by the young(er generation)" (Ikels 2004, p. 3; parentheses original). Ultimately, Ikels notes, "in the classics and in popular thought, support, subordination (or obedience), and continuing the family line have all been touted as the essence of filial piety" (Ikels 2004, p. 3; parentheses original).

Historically, cycles of intergenerational reciprocity in care have enabled societies to be sustainable and for members of societies to be emplaced within social structures that assure some level of care. This assurance has often worked through social pressures such as the shame that would accrue if care responsibilities were not adequately undertaken. The negative impact that parental neglect would have to individuals' social standing would mean the welfare of their parents was in their interest.

However, diverse processes associated with globalization are increasingly challenging some long-existing social values and practices that have ensured the welfare of older persons. Such changes have been described as "alarming policy makers" (Ikels 2004, p. 8). This entry will briefly discuss some of these processes and their impacts, some of the diversity of cultural attitudes toward filial piety, and government-led strategies for addressing filial neglect, and finally it will consider some prospective ways in which globalization might impact feelings about and the execution of filial obligations in the future.

## The Impact of Global Processes on Filial Piety

One process associated with globalization that can be readily seen to disrupt people's abilities to carry out their filial duties is the globalization of work and employment. People are increasingly able – and are often required to – acquire work in geographically distant places. The employment market place and competition for jobs has become globalized. On the campaign trail in 2008 to become president, Barack Obama illustrated this situation to supporters in Michigan when he said that "Michigan's children will grow up facing competition not just from kids from California or South Carolina, but also from young people in Beijing and Bangalore" (Obama 2008).

An associated process of globalization is the increasing ease of migration for many (but by no means all) people. Leaving the place of one's origin and family is frequently a relatively low-cost undertaking. The decreasing costs of transportation, including air travel, make migration accessible, whether for study or work. Such travel is often to major cities, which are themselves key nodes through which the global economy flows. Whether this travel is international or intranational, migration frequently disrupts family units and the cycles of intra-family and intergenerational reciprocity that have made many societies sustainable (e.g., Farrell 2016, p. 110). Cities, although dense with people, are also known to be places where social disconnection, anonymity, and anomie very readily occur (Klinenberg 2001).

In addition to the above, however, are less tangible impacts associated with globalization that are increasingly cultivating individualistic attitudes and identities, moving many away from more collectivistic attitudes and identities (e.g., Luxton 2010; Elliot and Lemert 2009). These values are often associated with the effects of the hegemonic sociopolitical and economic perspective that is frequently glossed as "neoliberalism." Neoliberalism seeks to reward individual efforts and success and promotes consumption by emphasizing self-gratification through the acquisition of goods and services, the satisfactions of which are advertising through diverse forms of marketing. Increasing orientations toward individualism and self-gratification steer people's decisions relating to the allocation their resources – both financial and other – away from their filial obligations.

## Culture and Filial Piety

Although the trends toward individualism are part of globalization (Elliot and Lemert 2009), it is certainly the case that there remain differences between countries in terms of the predominance of collectivistic or individualistic values and identities (Triandis 1988). Individuals in societies that are more collectivistic tend more to see themselves as part of a web of wider social relations, whereas those in more individualistic societies tend to derive their identities with reference to their own opinions, actions, and achievements.

However, although differences *between* countries might most immediately spring to mind when thinking about cultural differences such as those along the axis of collectivism and individualism, it is worth emphasizing that different ethnic and religious communities within countries exhibit different attitudes about filial responsibility. Indeed, Ikels notes that "the practice of filial piety, both its delivery and its receipt, is situationally dependent and shaped by local circumstances of history, economics, social organization, and demography and personal circumstances of wealth, gender, and family configuration" (2004, p. 2).

Within Indonesia, for example, cultural differences have considerable impacts on how responsibilities toward elders are conceived. Elisabeth Schröder-Butterfill and Tengku Syawila Fithry (2014) have described how Javanese Indonesians and those from Minangkabau communities – the latter of which are often described as matrilineal – view parental care responsibilities. Among their findings were that for both, adult children, but not their spouses, were important in aged-care provision and that daughters were preferred over sons in providing this care. However, the strength of this preference and the acceptance of people from other categories of relationship varied according to the ethnic community (Schröder-Butterfill and Fithry 2014, p. 370).

Ethno-religious differences relating to filial responsibility and respect were also found in Australia by Carr et al. (2015). Carr, Biggs, and Kimberly examined the religious traditions and practices of Australian Christians, Jews, Muslims, Hindus, Buddhists, and Confucianists and described differences in practices and attitudes between them. For example, they report that while there is within the Jewish community "a long and proud tradition of aged care [which] has resulted in aged support services catering for diverse needs," followers of Islam tended to regard caring for elders to be a responsibility to be undertaken by family (Carr et al. 2015, pp. 27–28). Overall, they found that the positive valuation of the contributions of older persons was strongest among those who held Jewish, Islamic, Hindu, and Buddhist beliefs.

## Filial Piety Laws

Although there are communities in which filial piety remains strong, it is the case that even in those where filial piety might be imagined to be strongest, such Chinese communities with strong Confucian traditions, diverse processes of globalization are eroding the ability or will of people everywhere to discharge filial obligations. The impacts of this can be considerable, both at personal and emotional levels, but also for governments. With respect to the latter, developments in social values raise questions relating to the State's obligations to look after elderly citizens who are not cared for or inadequately cared for by offspring. This is especially important in contexts where State welfare is limited or nonexistent, and also in the now ubiquitous situation where governments are seeking to cut spending in view of debts or a neoliberal philosophy that promotes "small government." Furthermore, with many nations facing the prospect of the increasing demographic proportions of the elderly, "any faltering in the performance of filial piety is regarded [by governments] as a disaster" (Ikels 2004, p. 9).

In view of the neglect of many parents, some States are considering implementing "filial piety laws." Muslim-majority Malaysia is one such country that has mooted this. Countries that have implemented such "filial piety laws" include France, China, and some States in the USA. With respect to the latter, Allison E. Ross has outlined some of the positive aspects – actual and potential – of "filial responsibility laws" (Ross 2008). Ross examined both the civil and criminal filial responsibility laws in operation within the United States and analyzed the benefits of having such laws effectively enforced. Ross noted the rising cost of US federal government funding for federal programs such as Medicaid and social security payments. With elderly Americans increasingly reliant on social security benefits, the funding of social welfare will be severely strained (Ross 2008, p. 184).

In this context, filial responsibility laws, according to Ross, have the potential to assist older Americans meeting basic needs and health care. Ross argues that effective enforcement of

filial responsibility laws, especially within the States of the US that still have such laws, can have two further benefits. First, they can reduce government expenditure and/or provide the elderly with care that supplements what the government can provide (Ross 2008, p. 185). Second, by shifting some of the financial burden of care for the aged onto their offspring, government expenditure could focus on those older persons who are without family or who have family that is unable to support them (ibid.)

A less favorable discussion of State-sanctioned compulsion on citizens to care for the parents is provided by Rita Jing-Ann Chou (2010) with respect to "Family Support Agreements" or FSAs in China. FSAs preceded China's 2013 implementation of a law titled the "Protection of the Rights and Interests of Elderly People," which requires citizens to tend to the "spiritual needs" of their parents and to visit them "often." Parents have successfully taken children to court in China under this law.

The notion of an FSA, however, was conceived in 1985 in Dafeng County and in the two decades that followed, FSAs were in use throughout rural China. Approximately 13 million such agreements were signed by 2005 (Chou 2010, p. 2). The FSA, according to Rita Jing-Ann Chou, represented an innovation to "meet the challenge" of elder support. However, several warnings have been sounded with respect to "filial piety laws" and the FSAs, which should be borne in mind by those who might consider deploying such policies or laws. Although the basis of the FSA rests on the shared moral value of filial piety, it's overtly explicit and narrow focus, relating to the provision of material support and/or emotional support, combined with the threat of legal sanctions, may be thought of as corroding the sincerity, "spontaneity" and "flexibility" that would otherwise be seen as part of filial piety. It also puts into question the place of filial piety as a "virtue" (Chou 2010, p. 9). Chou argues that this, along with the potential erosion of affection and mutual trust in intergenerational relations, should all be carefully considered before creating a social policy compels filial piety. Furthermore, complying with such laws may place a heavy financial burden on low income families who might suddenly find themselves needing to support three generations – their aged parents, themselves, and their children (Chou 2010, p. 9).

## The Future of Filial Piety

Although filial piety laws might be seen as indicating filial piety which remains an important social value that the society in question continues to uphold, we might alternatively view such laws as indicative that the opposite is increasingly the case. Such laws can be seen as demonstrating the extent to which those obligations are not being met (cf. Ikels 2004, p. 4). Furthermore, they might be seen as part and parcel of the effects of a globally hegemonic neoliberalism that is fostering individualism and a shrinking State.

Present and future job scarcity also threatens filial piety. Whereas in the present a globally mobile workforce can seek jobs that would previously been more likely to be filled by local candidates, job availability might in the future also be threatened by evermore-sophisticated technology, including robotics. Robotics has already impacted on employment in a number of fields, and authors (e.g., Dunlop 2016) have suggested that paid work may be so undermined that a "universal basic income" may be instituted in response to the political impacts of this unemployment. While this, and some of the following, is of course conjecture, a scenario of mass unemployment leading to a universal basic income might in fact have positive impacts on the ability of people to undertake their filial obligations by negating the need to migrate for work. Alternatively, of course, an unresponsive or under-resourced government may simply allow the recession of jobs to result in the financial immiseration of its citizens, irrespective of age.

The prospect of technological advancement might also mean that robots may be able to undertake the labor of looking after frail elders (Ross 2016). Advances in robotics, including the ability to mimic the expression of human emotion and to read emotion, may mean that some of the emotional and physical challenges of looking after

highly dependent older persons may be much alleviated. This would pose a reduced burden on individuals who may wish to pursue other interests (and whose parents may also wish them to pursue those interests). The adequacy of aged-care facilities and worries about the professionalism of staff are common concerns for those who must decide how their parents will be accommodated. Although impersonal and unfeeling, robots that are free from exhaustion, cruelty, and other human vices might be welcomed by all parties. How "society" feels about the prospect of human-to-human interaction being replaced by human-to-robot interaction will of course have to be a matter for public discussion and debate, but the likely immediate conclusion that this is an undesirable outcome will not necessarily be subscribed to by all, and attitudes may well change over time as people become more comfortable with and used to living with robots and technology.

The opportunities and challenges presented by technology in general, however, are not entirely in the future. Already, technology is playing an immense role in the lives of many families, enabling them to connect face to face through computers, tablets, and mobile phones through applications such as Skype. A study conducted by the present author for the Toyota Foundation (Toyota Foundation grant D14-R-0201, commenced in 2015 and concluded in 2017) explored how three families spread across Indonesia, Malaysia, and Australia continued to uphold their filial obligations. Among them all, technology was central to the ongoing maintenance of personal family ties as well as the transfer of financial remittances. Although technology is certainly enabling the exercise of filial responsibilities, it is also the case that many older citizens find even the most basic of current technologies too challenging to engage with, leaving them stranded across a "digital divide" (Annear 2014). This divide is one that social policy and State funding might be able to address.

The aforementioned study also revealed the importance of understanding and not assuming the subjective experience of having one's family internationally dispersed. One Chinese Malaysian father reported how his friends regarded him as "successful" because his children worked abroad. He, however, spoke through tears, saying that he doubted this because he enviously saw how his friends' children remained by their sides. Evident here is that social valuations of offsprings' migration for work can differ and could evolve, so society becomes either more or less accepting of it.

The study also made clear that, although technology was important in maintaining familial bonds, occasions that brought family members physically together were vital in strengthening bonds. Such occasions included rituals such as celebrating New Year or weddings. Although infrequent, the profundity of these events meant that deep connections and commitments were affirmed by them. For this to occur for families around the world, accessible travel is vital. Increasingly cheap airfares in many parts of the world have enabled less well-off people to visit kin in distant places. Although there might seem to be no threat to such airfares continuing into the future, air travel is a major consumer of fossil fuels, and thus low fares are dependent on the price of those fuels as well as potential global action that might seek to curtail carbon emissions, such as through taxation on fossil fuels.

## Conclusion

Returning the care given to them by their parents is important for many people around the world. The obligations of filial piety lead millions of people around the world to make sometimes difficult and heartbreaking life-choices regarding how they live their own lives: whether they follow dreams and opportunities, whether they entrust the day-to-day care of their parents to paid strangers, and whether they – through choice or the exigencies of circumstance – decide they cannot or will not fulfill their filial obligations. Similarly, for governments, care for the elderly is and will increasingly become a major social and economic concern which will necessitate potentially unpopular decisions.

For individuals and governments alike, decisions and actions will take place in the face of

diverse processes associated with globalization that have altered, are altering, and will alter in the future, the matrix of factors within which decisions will be made. Global trends in attitudes, developments in technology, demographic shifts, and the globalization of the economy and employment are some of the factors that will influence how we will and can think about and how we might fulfill our responsibilities to our nearest and dearest.

## Introduction

This chapter needs a subtitle. It should read *Globalization and Gender Frontiers: Mind the Gap*. In the lead up to the 2016 World Economic Forum in Davos, Oxfam (2016) revealed two shocking statistics that went viral: eight men owned the same wealth as the poorest half of the world and the richest 1% had more wealth than the world's poorest combined. The year before, Action Aid (2015) tried to help the men of Davos understand exactly where women were placed in social and economic terms. They calculated US$9 trillion as the cost that women in developing countries bore each year due to unequal wages and ever-narrowing access to paid jobs. This, Action Aid (2015) claims, was equal to more than the gross domestic product (GDP) of Britain, France, and Germany combined. The organization went on to state that the global value of the gendered wage and workforce participation gap was equal to US$17 trillion each year (Action Aid 2015).

All over the world women and girls bear the brunt of globalization: women make up roughly 60% of the world's poor. In sub-Saharan Africa and South Asia, over 80% of women workers labor in unregulated and precarious sectors (ILO 2015). Although 80% of the world's garment workers are women (World Bank 2014), in garment factories in Bangladesh one in 20 supervisors is a woman (Filippo 2014). Globally, 83% of domestic workers are women (World Bank 2014). The vast majority of these laborers are not covered by labor laws and have no access to basic provisions like minimum wages, maximum hours, or maternity leave. While considerable emphasis has been placed on raising education levels, it seems that this alone is not enough. In 2013, double the amount of women with a secondary education were unemployed compared with men who had the same education levels in low-income countries. In countries where women also face multiple legal barriers that restrict their access to work (e.g., the Middle East and North Africa), almost 80% of unemployed women held advanced degrees (World Bank 2014). The same statistic for men was 20% (World Bank 2014). Unpaid (and undervalued) caring responsibilities overwhelmingly remain women's responsibility as women and girls are responsible for a disproportionate share of child rearing, domestic work, and caring for the sick and elderly. In Australia, in 2006 female parents spent 8 h and 33 min per day caring for children aged under 15 years compared with 3 h and 55 min for male parents (AHRC 2013). These additional responsibilities narrow women's choices, the types of jobs they can get, and the hours and times that they can work: 66% of employed women with children under the age of 6 years worked part time compared with 7% of employed men with children of the same age in Australia (AHRC 2013). The burden of childcare responsibilities, de Silva de Alwis claims, has created a "motherhood penalty" (de Silva de Alwis 2011, p. 309, see also Bloom et al. 2009). Using panel data from 97 countries, de Silva de Alwis demonstrated how birth reduces women's labor supply by almost 2 years. Australian research has highlighted substantial gender differences in caring responsibilities and work, observing that while men's full-time employment *increased* by about 27%, women's *decreased* by 20% when they had a child under the age of 5 (AHRC 2013).

On average women are paid between 10% and 30% less than men for work of an equal value (World Bank 2014). While this gender gap may be particularly acute in North Africa, the Middle East, and South Asia, persistent gaps exist in high-income OECD countries including Australia (currently at 17.3%) (World Bank 2014; WEGA 2016). The results are equally bleak with global labor force participation rates at 82% for men and 55% for women as at 2014 (World Bank 2014). Despite the enormous effort undertaken on gender mainstreaming, the World Bank (2014) stated that women's labor force participation rates have stagnated and any narrowing of the gap that has occurred is because of the decline in men's labor force participation. The labor force participation gaps vary by region; however, gaps occur across all countries: globally, men are twice as likely as women to have full-time jobs and in South Asia they are three times as likely (World Bank 2014). In looking at long-term labor force participation trends, the figure for women's labor force participation has actually gone down, falling by two points since 1990 (World Bank 2014). No country in the world has reached gender wage parity, and on all fronts, progress has stagnated over the last decade. According to the International Labor Organization (ILO) (2015), at the current rate of progress, it will take the world more than 70 years to achieve just one basic measure of gender equality in labor markets: equal pay for equal work.

Much has been written on how globalization has exacerbated gender inequalities in labor markets, as around the world women cannot and do not access labor markets equally as men do. Globally, wealth inequality continued to rise in 2016. When measured by the share of the world's wealthiest 10% of adults compared with the rest of the world, the bottom half of the world collectively owned less than 1% of the world's wealth, while the world's wealthiest 10% owned 89% of the world's assets (Credit Suisse 2016). Don't get me wrong, there is no doubt that wealth

inequalities and labor force participation rates are central issues; however, the problem with this analysis of globalization is its materialist underpinnings and the point that it is missing a large part of the picture. By asserting the centrality of production (as above), analyses of globalization tend toward economic reductionism or focus primarily on changes in relationships between markets and states. The problem with this, Marchand and Runyan suggest, is that when economic frameworks and analyses are privileged, "little attention is paid to global/local restructurings of social, cultural, racial, ethnic, gender, national, familial identities, roles and relations" (2001, p. 136). Although highlighting the importance of economic analyses, this chapter sets out to go beyond these conventional analyses, representations, and interpretations of globalization and the "add women and stir" approach. A gender analysis of globalization, Marchand and Runyan go on to claim, requires more than "inserting 'women' into already existing international political economy analyses" and their emphasis on macropolitical and macroeconomic interconnectedness (2001, p. 137, see also Sassen 2000). The gender analyses of globalization explored in this chapter expose not only the dichotomous ways of thinking, informing discourses of globalization, but also challenge the power of attributing meaning by highlighting how discourses on globalization and gender reproduce gendered dichotomies and stereotypes. It hopes to offer a different perspective and approach for understanding the multidimensionality of globalization and the centrality of gender and global circuits that increasingly incorporate growing numbers of women as well as highlighting the difficulties faced in doing theory in a globally inclusive way (Connell 2007; Sassen 2000).

## Imagining Globalization and Gender

In imagining globalization and gender, it is useful to consider definitions of globalization in the literature and the geopolitical patterning of knowledge that prioritizes the global North. Feminist analyses, particularly postcolonial and poststructural feminist perspectives, have long recognized this as a persistent problem in discourses of globalization. Most definitions take the 1980s as their referent point; define globalization in terms of "global interdependency," or as global economic, social, and political integration; and view the process as something that is unstoppable and irreversible. Globalization then is taken to be a "set of processes by which the world is rapidly being integrated into one economic space via increased international trade, the internationalization of production and financial markets, the internationalization of a commodity culture promoted by an increasingly networked global telecommunications system" (Gibson-Graham 1996, p. 1). Often, linkages are made between these social and economic changes and other radical transformations that occurred in the global political economy including the collapse of Soviet communism (the "fall of socialism"); Thatcher, Reagan, and populist right-wing politics in the UK and the USA; and the move away from the welfare state (the "rise of neoliberalism").

Although there are many different positions in the globalization debates, as Davids and van Driel note, a common denominator is that "globalization is, at the very least, about an increasing interconnectedness of the world through technology and flows of capital, commodities, people and culture" (2001, p. 154). Often, this comes with the idea of a "global society" in which the old boundaries of the nation-state are rapidly breaking down as modernity spreads across the world. These dominant frameworks for understanding globalization carry with them the idea of globalization as an economic strategy, but they also show how it is increasingly being viewed and interpreted as a new form of society (Connell 2007). This formulation is expressed by key globalization theorists as follows:

> We live in a world of transformations, affecting almost every aspect of what we do. For better or worse, we are being propelled into a global order that no one fully understands, but which is making its effects felt upon all of us. (Giddens 2002, p. 6–7)

> All remaining 'Chinese walls' the world over are being battered down. In this process, those cultural and political institutions that fettered capitalism are swept aside . . . Globalization . . . is unifying the

G

> world into a single mode of production and a single global system and bringing about the organic integration of different countries and regions into the global economy. (Robinson 2001, p. 159)

It is clear from these quotes that the dominant way of thinking about globalization is through a unilinear process and a macroeconomic perspective. Globalization orthodoxy is careful to state that these processes may be complex and set in many different fields, but as Davids and van Driel highlight, the unilinearity of these complex processes is "largely determined by a neoliberal logic based on a modernist way of thinking" (2001, p. 155). Although some in the field are critical of neoliberalization, as Davids and van Driel (2001) claim, the pattern of thought is almost always structured within the frame of a linear process, and this leads them to argue that globalization only gets its meaning in neoliberal and anti-neoliberal modes of thinking. Globalization, conceptualized as a "complex set of processes" (Giddens 2002, p. 12), is located in a global context but without the context being problematized: "It occurs as an 'out there' process, but what does that context envelop and who does it concern? Global from whose perspective and according to which process?" (Davids and van Driel 2001, p. 155). Theories on globalization see and speak from the global North, and feminism has learnt to question hegemonic gender-blind analyses and, within feminism itself, hegemonic gender-essentialist analyses that represent the problems and interests of privileged groups as quintessential and representative (Mohanty 2003; Narayan 1997). World-spanning generalizations, Eurocentric theories, and the masculinization of the discourses of globalization have become key issues for contemporary feminists as they struggle to unpack the picture of globalization and gender and resulting theoretical perspectives and political agendas that efface the perspectives of marginalized groups, particularly women.

## Discourses of Globalization as Gendered

Discourses of globalization are highly gendered and, as the feminist geographers Gibson-Graham note by reading globalization literature through the lens of poststructuralist feminist and queer writing, feature a "language of domination" and "tightly scripted narrative of differential power" (1996, p. 1). Some of the key themes in hegemonic representations of globalization include the seeming inevitability of capitalist penetration and naturalness of capitalism along with the scripting of capitalism as male/masculine. Feminist researchers have observed how gendered symbolism and metaphors serve to naturalize hierarches in discourses of globalization and that the relations of domination and power contained within these discourses cannot be sustained without drawing on gender symbolism (Marchand and Runyan 2001). In their insightful analysis Gibson-Graham (1996) argue that globalization narratives read like "rape scripts" (rape scripts are based on the notion that women and men play out fixed gender roles as aggressors (unable to control their behavior) and victims (unable to stop the act)). By undertaking a gendered reading of globalization narratives, Gibson-Graham (1996) show how capitalism is represented as inherently male and involving taking over "others" (e.g., "weaker" noncapitalist economic systems including developing/Third World economies, socialist economies, traditional economies, communal experiments) that are represented as sites of invasion, envelopment, and accumulation. Gibson-Graham claim it is a "script of non-reciprocal penetration" that ascribes the victim role to forms of noncapitalist economy as "capitalist social and economic relations are scripted as penetrating "other" social and economic relations but not vice versa" (1996, p. 6). In globalization narratives, certain states are scripted as being able to bond with capital and are thus granted a masculine status, while Southern and other subordinated states are forced to accept feminized states. Within states, sectors remain "domesticated" and are becoming increasingly disadvantaged or "feminized" (e.g., ministries of health, education, social affairs) as other sectors are internationalized or directly related to the global economy and "masculinized" (e.g., ministries of finance and economic affairs) (Marchand and Runyan 2001).

These feminist analyses are part of an important critique of globalization that attempts to counter dominant narratives that cast globalization as an irresistible (and masculine) force and use gendered constructs and symbolism to legitimate and rationalize neoliberal economic policies. Feminist theorizing attempts to think through alternative responses to globalization and the homogenizing claims made within it, which as Grewal and Kaplan (1994) suggest, needs to be scrutinized for its heavy reliance on gendered discourse and gender ideology. This not only serves to make globalization (and capitalism) appear as natural and inevitable but also scripts the possible forms of resistance to it or when coming from positions of passivity, victimization and conquest, an inability to resist. In the words of Gibson-Graham, feminists are pursuing this project in the hope of gaining "some purchase on globalization discourse, to become more active in the face of it, less prey to its ability to map a social terrain in which I and others were relatively powerless and inconsequential" (1996, p. 4).

## Discourses of Globalization and Representations of Women

The naturalization of capitalism and capitalist values in discourses of globalization is essential in creating the image of globalization as being something that is seen to simply happen and is beyond the power and influence of peoples. The flow-on effects of this logic add another layer to the gendering of discourses of globalization evident in dominant discourses on the feminization of poverty that rely heavily on gender essentialism in some of the main scripts employed. Although the term "feminization of poverty" was coined in the 1970s, it first started featuring in development jargon in the mid-1990s. This was largely through the UN's Conference on Women held in Beijing where it was announced that 70% of the world's poor were female, and, as a result, eradicating the persistent and increasing burden of poverty on women was adopted as one of the Beijing Platforms of Action (Chant 2008, p. 166). While Rodenberg (2004) has noted the lack of gender-specific data on incomes and our current inability to comprehensively break down women's income and poverty in relation to men, what was an "opportunistic shorthand," the feminization of poverty, quickly became an established fact in discourses of globalization and gender (Chant 2008). In the globalization literature, the feminization of poverty is a phenomenon resulting from the impact of structural adjustment policies (SAPs), internationalization of the labor market, and economic restructuring on the position of women (Davids and van Driel 2001). The concept not only drew attention to the number of women living in poverty but also to the existence and specific vulnerabilities of female-headed households. The concept has played a key role in giving gender a prominent place in globalization and development discourses; however, the way in which this has been incorporated in programs has been through the "feminization" of antipoverty and development programs (Batliwala 2007; Chant 2008). This, Chant (2008) claims, has not helped relieve women of the burden of coping with poverty in their households and at times has exacerbated this.

The feminization of poverty certainly helped raised awareness of the need to incorporate gender differences; however, the concept refers to a *process* and carries the idea that poverty is a *gendered experience*. Another largely unspoken aspect of this concept is that it also implies a counterpart, namely, the masculinization of power, privilege, and accumulation (Chant 2008). However, very little consideration has been given to this idea in analyses and programmatic responses. In practice, the feminization of poverty is commonly mistaken as equating to higher levels of poverty for women and the need to justify women in policies, nationally and internationally. Chant (2008) questions the concept and its neglect of the heterogeneity of women as it pays little attention to the differences among women. It also overemphasizes income at the neglect of other more complex factors, and men and gender relations are left out of the picture (Chant 2008). Intra-household power relations and gender inequalities are given scant attention as the thesis becomes:

globalization has resulted in the feminization of poverty, which is mostly found in female-headed households – the "poorest of the poor":

> The result is that female-headed households appear as a uniform category and that they are poor and require support. This statement has an implicit economic connotation concerning poverty as well as an implicit and explicit gender connotation. What is implied is that female-headed households are poorer than male-headed households. The question that is not asked, however, is whether women are better off in male-headed households. By making male-headed households the norm important contradictions vanish within these households, and so does the possibly unbalanced economical [sic] and social position of women compared to men. (Davids and van Driel 2001, p. 162)

Although the "feminization of poverty" highlights the impact of macroeconomic policies on women, as Chant (2008) highlights, an unfortunate by-product of this concept is that it presents women as victims. Feminist research has been critical of the victim status accorded to women and the practices and effects of globalization. By looking at the dynamic and conflicting relations between women workers, households, and the state and documenting women's stories of complexity and their multiple forms of resistance and struggles for rights, this research challenges representations of women as victims as the only one available (Davies and Dent 2001; Eisenstein 1998; Gibson-Graham 2006; Hooper 2000; Kempadoo 2005; Mills 1999; Ong 1987; Sandy 2014). It is critical of the casting of women as "victims" because the construction acts to justify and legitimate the involvement of states, NGOs, and other social actors in the lives of poor women around the world. It is a representation that also resonates with gendered discourses and assumptions about women's "natural" vulnerability, and in the globalization and development debates, passivity and victimhood have become associated with women in developing countries. As Mohanty highlights (2003), when this is situated in the context of Western researchers, particularly white, middle-class women, writing about Third World women, the writing in of women as victims serves to perpetuate the colonial gaze and the ongoing discursive colonization of women's lives and struggles. It is a framing that has also led to some very problematic representations in the area of sex work constructed around, and based on, women's passivity, sexual victimhood, and sexual exploitation (Kempadoo 2005; Sandy 2014). The construction of women as victims is also problematic because, shaped and structured around perceptions of the vulnerability of women, it promotes the view that women get "special support" rather than "equal rights" (Chant 2008).

The feminization of poverty concept has also been critiqued for failing to consider the feminization of responsibility and obligation (Chant 2008). The coupling of gender and poverty within this concept has given rise to an alluring promise, or a "win-win formula": in the processes of eradicating poverty, gender equality can also be achieved (Rodenberg 2004). The undue emphasis that is then placed on women's economic development has come at the expense of not adequately scrutinizing women workers in the global (and local) labor force. Although women may have the freedom to move to cities and take jobs in factories, these young mobile working women are often responsible for three to four generations. Many do not receive anything close to a living wage, and they must support themselves and pay for the education of their siblings and/or children, help their rural families buy the inputs required for cash cropping, and provide money for medical emergencies and healthcare costs, food for their families and children, and household bills, or purchasing land and making essential repairs to housing and access to consumer goods like televisions (Mills 1999; Sandy 2014). Many women workers meet these demands by living in squalid conditions, saving their money, delaying marriage, and having children in order to fulfil cultural, social, and familial obligations and be "dutiful daughters" (Sandy 2014). In developing countries there is no welfare system, and these obligations do not weigh as heavily on men as they do on women. Women's remittances and responsibilities to their families become central in understanding women's participation in the labor force and the "moral economies" of globalization (Sandy 2014).

## Women's Empowerment (as a Cliché)

Much has been written about how calls for women's empowerment have acted as justification for colonization, modernity or the protection of cultural traditions (Davia and Yuval-Davis 1995; McClintock 1995; Stoler 2002; Towns 2010; Yuval-Davis 1997). Gender is now ubiquitous as a category of analysis and programmatic focus in development, with the international community embracing feminist ideas through the mainstreaming of gender and focusing on women's empowerment. Indeed, during the 60th anniversary celebrations for the UN's Commission on the Status of Women, the UN Secretary-General commented: "The world is also starting to grasp that there is no tool for development more effective than the empowerment of women and girls . . . [N] o other policy is as likely to raise economic productivity, or to reduce infant and maternal mortality" (Annan, cited in Eisenstein 2010, p. 423).

The UN Secretary-General's strategic use of women's empowerment as a magic bullet for development is a worrying one. In development and globalization literature and discourse, women's empowerment has been adopted as a buzzword and has become code for development. This has had the effect of depoliticizing and subverting a process that challenges the deepest structures of power and obfuscates the feminist concern to radically transform structures of power, inequality, and oppression (Batliwala 2007). Feminists have rightly critiqued and challenged understandings of women's empowerment as a means toward economic development of a society at whole. Economic development, Narayan claims, is the "latest incarnation of the greater good that is to be served by the emancipation of women" (2010, p. 282). Eisenstein observed that the UN Secretary-General's statement is "deeply misleading" for, as she points out, there is a much more effective tool than women's empowerment for economic development, namely, state-led development (2010, p. 423). This is problematic rhetoric because it makes women the key to economic development while simultaneously masking huge inequalities and suggesting that the benefits of empowerment to women alone are not enough and need to be supported by other additional factors (Narayan 2010, p. 282). It is deeply unsettling for feminists because, as the deeper analysis of the feminization of poverty concept undertaken above shows, this renders women's empowerment as little more than a cliché. As part of the modalities of capitalism, "globalization" saw the introduction of SAPs in the 1980s. These were the practical tools used by international financial institutions like the World Bank and International Monetary Fund as a means to promote "globalization," and these policies have produced profound social, political, and economic changes in "emerging economies" (to use globalization parlance) (Pfeiffer and Chapman 2010; Sandy 2014; Sparr 1994). The forces contributing to the feminization of poverty act on a macro-level (including SAPs), and it is this which needs to be reversed in order to bring about the conditions necessary to change the status of women. The empowerment of women, however, becomes an impossible task as dominant discourses of globalization and gender construct women as having no power over these forces, indeed they are its victims. Ultimately, this renders the empowerment of women as a meaningless slogan, and, reduced to little more than a cliché, women are made into the instrument of the fight against poverty in globalization and development discourses and antipoverty programs while simultaneously scripted as having limited ability to make an impact (Davids and van Driel 2001).

## Conclusion

The naturalization of capitalism and capitalist values in discourses of globalization has profoundly influenced feminism, engendering a hegemonic, neoliberal, consumerist feminism largely preoccupied with women's advancement in the corporate world and focusing on financial equality between women and men (Hawkesworth 2004; Mohanty 2003). Yet, as Hawkesworth claims, feminism learned some hard lessons of "decentering white, middle-class Western women; acknowledging the

multiple voices in the movement, supporting the priorities of women of color and women of the global South; and fighting racism, homophobia, heteronormativity and cultural imperialism" (2004, p. 965). All of these lessons have been crucial in creating an inclusive, international feminism. The challenge in this emerging area of feminist theorizing and activism is understanding how globalization affects nations, races, classes, genders, and sexualities and the uneven and dissimilar circuits of culture and capital (Grewel and Kaplan 2006). Drawing on Third World, postcolonial, and poststructuralist feminisms, feminist theorizing and practice is attempting to interrogate social and spatial difference, while reflecting on local realities and transnational issues as part of the feminist project to create and stimulate dialog and activism aimed at destabilizing dominant structures like globalization and developing alternative conceptualizations of resistance that highlight women's economic agency and their cultural and political struggles (Dempsey et al. 2011; Grewel and Kaplan 2006).

Feminist research has played a crucial role in highlighting how globalization and gender, as a relation of inequality based on social constructions of masculinity and femininity, are intricately interconnected (Davids and van Driel 2001). In taking this work to the next frontier, feminists like Gibson-Graham (2006) are exploring the identity of capitalism and the ways in which this can be demasculinized. As they (1996: 18–9) suggest, this includes seeing it as fluid and malleable or to draw on the penetration metaphor, to penetrate and be penetrated, and how globalization may involve a variety of different economic paths so our frameworks for understanding globalization do not constitute economic development as capitalist development only and can recognize interconnections as working reciprocally or as two-way ties and global interdependencies.

# Globalization and Genocide

Hariz Halilovich
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Introduction

Broadly defined as acts committed with intent to destroy, in whole or in part, a national, ethnic, racial, or religious group, genocide had been an instrument of "purifying" territories by eliminating unwanted groups for much of the twentieth and continuing into the twenty-first century.

As defined in Article 2 of the United Nations Convention on the Prevention and Punishment of the Crime of Genocide issued in 1948, genocide refers to any of the following acts committed with intent to destroy, in whole or in part, a national, ethnic, racial, or religious group, by:

(a) Killing members of the group
(b) Causing serious bodily or mental harm to members of the group
(c) Deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part

(d) Imposing measures intended to prevent births within the group
(e) Forcibly transferring children of the group to another group (United Nations General Assembly 1948).

Although many of these genocidal acts were and continue to be committed in various conflicts – and some might have been relatively well documented – proving the intent that these acts were planned in advance and aimed at destroying a social group "in whole or in part" has been a much more difficult task than confirming that they actually did occur (Halilovich 2016). Thus, in legal terms, the crime of genocide requires proving the intent through evidence accepted by an appropriate national or international court such as the International Criminal Court. Because of this, it is almost impossible to call a genocide-like crime genocide while it is in progress, which makes it difficult to prevent or stop such violence. Nonetheless, from an academic and activist point of view, it is important to understand why, when, and how genocide evolves from an abstract idea to a real mass grave.

## Genocide as Modern Crime

Genocide and similar acts of mass violence often get labeled "barbaric" or resulting from "ancient hatred," implying that they are somehow the inevitable rudiments of primordial times and incompatible with the modern way of life (Bowen 2002). However, as this paper describes, such arguments are misleading as they ignore the strong correlation between modernity and genocide, the two seemingly incompatible sets of values and ideas.

Indeed, genocidal violence as the ultimate crime against humanity has marked much of the modern history, though methods, victims, and perpetrators have differed from case to case. This does not imply that similar violence aimed at annihilating a whole people did not take place in premodern history. However, genocide became institutionalized and brought to perfection only in modern times (Watts 2016). As Zygmunt Bauman points out, "modernity was not the Holocaust's sufficient condition; it was however, most certainly its necessary precondition and an outcome of the modern bureaucratic culture" (1989, pp. 13–15).

At the peak of the technological and scientific advancement and a universal appeal of nationalist ideologies in the first half of the twentieth century, modern Europe experienced concentration camps and annihilation of whole peoples, most notably the European Jews through the Holocaust. As a result, in 1945, many nations pledged "never again" to such violence, and 3 years later the United Nations enshrined the pledge in The Convention on the Prevention and Punishment of the Crime of Genocide. It was then that the term genocide was used for the first time, coined by Raphaël Lemkin, a US lawyer of Jewish-Polish descent many of whose relatives perished in the Holocaust. Like many other modern terms, the word genocide was made of Greek and Latin words: the Greek *génos* (race, stock, kin, people) and the Latin suffix *-cide* (killing). Lemkin's concept of genocide – signifying "a coordinated plan of different actions aiming at the destruction of essential foundations of the life of national groups, with the aim of annihilating the groups themselves" (Lemkin 2002, p. 27) – provided the basis for the UN convention on genocide.

In defining the ultimate crime against humanity, Raphaël Lemkin observed that genocide does not necessarily mean the immediate destruction of a nation, except when accomplished by mass killings of all members of a nation. The objective, he noted, is the disintegration of the political and social institutions, of culture, language, national feelings, religion, and the economic existence of national groups, and the destruction of the personal security, liberty, health, dignity, and ultimately the lives of the individuals belonging to such groups (Lemkin 2002).

Twenty years after the Holocaust, the UN convention did not stop the genocide in Cambodia, and 50 years later, when the Western world was reaching its peak in promoting universal human rights and the Holocaust Museum in New York was opened, similar genocides were underway on the European continent, in Bosnia, in Africa, and

in Rwanda. A new term describing the genocidal politics of violence at the time was created – *ethnic cleansing* (Humphrey 2013). Since then, we have seen genocidal violence taking place in parts of Iraq, Syria, and Myanmar.

Bauman has drawn our attention to the two almost paradoxical sides of modernity, including the most recent stage of "liquid modernity" and the era of globalization (Bauman 2000). On the one hand, the goal of modernity's "civilizing project" was to free humans from premodern social organizations and backwardness by bringing reason to our understanding of human nature and behavior and creating sophisticated forms of social organization and way of life. The attribute *civilized* has become a synonym for everything that separates cultured, enlightened, and modern men and women from their primitive, brutish, and superstitious premodern ancestors. Or, as Emil Durkheim put it: "it is civilization that has made man what he is; it is what distinguishes him from the animal: man is man only because he is civilized" (1973, p. 149). Since Durkheim, reason, rationality, and science and their universal application are still widely seen as the key to human emancipation and happiness. As Ashe et al. (1999, p. 2) point out, "from the Enlightenment perspective, scientific knowledge liberates us from the shackles of dogma, leading us into freedom where we alone are in control of our destiny." Or, as Condorcet, the great philosophe of the eighteenth century, enthusiastically proclaimed, the Enlightenment is about "the abolition of inequality between nations, the progress of equality within each nation and the true perfection of humankind" (1955, p. 173).

On the other hand, modernity has not abolished violence as the most destructive and "uncivilized" form of human behavior. On the contrary, by the rationalization of violence, modernity has produced its most devastating forms resulting in the deaths of many millions of people and unhappiness for countless others (Watts 2016). Compared with warfare and killings in the premodern times, modern state-sanctioned killings are incomparably larger in their scope and number of victims. While freeing humans in some areas of everyday life, many of the modern achievements including technology, ideology, bureaucracy, and science have been used to perpetrate, rationalize, and justify human destructiveness on a large, "industrial" scale.

In their pessimistic account of modernity, Max Horkheimer and Theodor Adorno state that all the achievements of modern humans are nothing but their adaptation to this epoch. Humans have not abandoned their destructive nature – they have only sophisticated it. In their view, "men have not only overtaken their immediate predecessors, but thoroughly exterminated them in a manner which is not reflected in any other modern species, including the flesh-eating saurians" (Horkheimer and Adorno 1994, p. 222). According to these two modern thinkers, reason and rationality cannot be the source of human dignity because humans are capable of much more horrific forms of violence than nonrational animals.

Horkheimer and Adorno are echoing Michel Foucault (1982), who pointed out that political violence has been transformed into the modern state system by rationalizing it through a new theory of law and crime, a new moral or political justification of the right to punish. This included the disappearance of torture as a "public spectacle" and, instead, the rise of the process of "rationalization" of violence through institutionalized transformation as in the creation of the modern prison system and concertation camps. In this way, punishment becomes a complex social function and a political tactic, the aim of which is not only to indulge corporal punishment through physical pain but also to "discipline," "cure," or exterminate social deviants marked as criminals. The term criminal is, however, a very vague one and is defined differently in different legal systems, becoming a depersonalized bureaucratic category.

Max Weber famously argued that rationalization produced an "iron cage of bureaucracy" which regulates and controls all aspects of modern life (Waters and Waters 2015). Through control and regulations, bureaucracy alienates individual members of society by limiting their input into the rationalized legal system, while, on the other hand, it represents the most sophisticated form of "detached" authority where individuals are

functioning as part of a system that does not have any personal qualities. Or, as Hannah Arendt (1970) put it, bureaucracy is the form of the government in which everybody is deprived of political freedom and of the power to act and where guilt and responsibility are detached from individuals' actions. This form of modern power has helped to organize and carry out the most systematic cases of violence in modern history (Weber 1991; Arendt 1970).

Modern ideologies have also had a significant part in adding new qualities to the politics of violence. According to Arendt (1966), every full-fledged ideology has been created, continued, and improved as a political weapon and not as a doctrine. Ideologies have had a major part in mobilizing support and fighting for "their cause," leading to violent conflicts on small and large scales and the creation of totalitarian systems such as the Third Reich and Stalin's Soviet Union. By using state-sanctioned violence as means for political ends, these totalitarian regimes murdered more than 40 million people in the twentieth century (Arendt 1966).

This is not to say that the states that praise themselves for libertarian and democratic traditions are immune to political violence and genocide – as Geoffrey Robertson has addressed in his book *Crimes Against Humanity* (Robertson 1999).

## Genocide and Us

Almost all cases of genocide could be directly linked to nation state and nationalism as one of the dominant modern ideologies. While the nation-state formation might be associated with the early stages of modernity, that process is still very much alive today. Since the 1990s we have witnessed many state structures changing and disappearing and new states being created. For instance, 15 new states emerged from the former Soviet Union, and the collapse of Yugoslavia resulted in formation of 7 new states; Czechoslovakia split in Czech Republic and Slovakia, while Eritrea separated from Ethiopia and Southern Sudan split from the state of Sudan and East Timor from Indonesia. The process of the state formation was part of different nationalist projects and in many cases was accompanied by violence, including genocide.

The underpinning ideologies and means for achieving nationalist goals have not changed much in the last 200 years. The final and ultimate goal of nationalism as ideology and political project is still to create nation-state and to define its national territory, a process that is almost regularly accompanied with different forms of politically motivated violence. While defined in rational terms, nation, as a modern sociopolitical structure, remains a romantic idea based more on myths and imagination than on science and history and as such rather represents an "imagined community," as Benedict Anderson (1983) famously put it. However, the victims of nationalist ideologies are very real; in addition to those who are expected to give their lives for the nation state, the victims include those who do not share the exclusive national characteristics and are very often seen as barriers in national self-fullfilment. In the best-case scenario, such groups become minorities with limited rights, while in the worst these unwanted groups are persecuted and became subject to social and cultural marginalization, even physical annihilation.

Along with the modern ideologies, science and technology have been defining features of what it means to be modern. Science and technology have also resulted in the development of powerful and destructive weapons, greatly increasing the number of victims and the "quality" of killing itself. As Arendt (1970) points out, modern weapons have freed humans from the "natural" restraints we find in the animal kingdom, making killing from a distance "detached" and impersonal. She insists that "the specific distinction between man and beast is now, strictly speaking, no longer reason but science, the knowledge of the standards and the techniques applying them" (1970, p. 62).

Not much has changed since Arendt wrote this almost a half a century ago. With advancements in science and technology, the means for destruction and long-distance killings have become even more deadly, while the ideological justifications

and willingness of a critical number of people to participate in violence against others have not diminished over time.

## Collective Crime of Individuals

Since all genocides are large-scale and systematic attempts to eradicate populations, their execution is dependent upon large segments of a nation going along with the genocidal policies. It is a crime of many rather than of the few. The Holocaust, for example, has been called a "German national project" because it involved many participants and accomplices from all walks of life (Goldhagen 1996). Similarly, ethnic cleansing and genocide in Bosnia and Rwanda, while guided and orchestrated by nationalist politicians, nonetheless relied upon many ordinary citizens to facilitate the killing of members of the "unwanted groups," Bosniaks in Bosnia and Tutsis in Rwanda.

This raises the ontological question of why such acceptance takes place. How is it possible for genocidal states to gain popular support for their murderous policies? As Alex Alvarez (2001) comments, many of the individuals who participate are typically ordinary citizens who may well have values antithetical to violence and criminality. Nonetheless, ordinary individuals are not only potentially capable, but far too often engage in extraordinary collective crimes. In any genocide, the psychopaths and sadists are far outnumbered by individuals who can be considered "normal" in their psychological functioning. And this is what makes the crime of genocide more problematic than the other murderous acts classified as war crimes or crimes against humanity.

Putting aside Freud's (2000) argument that humans are intrinsically violent by nature, and that only constant repression, sublimation, and compromise on a subconscious level keeps us from killing each other, or being *homo homini lupus*, we need to look for the causes that bring modern human beings to such a destructive state of mind to perpetrate and tolerate genocide. At least some of the causes are to be found in the way modern society operates and the rationalization of violence that includes different phases such as planning, preparation, scientific and legal justification, and mobilization of the masses to support and carry out genocidal policies – as is elaborated in more detail later in the paper.

As seen from the Holocaust and the genocides in Cambodia, Bosnia, and Rwanda, genocide as a collective political crime receives much of its perceived legitimacy from scientists, professionals, and social elites who provide the ideological, intellectual, scientific, and legal underpinnings for the destruction of a specific group. They often justify genocide and other forms of political violence by providing "vocabularies of motive" – e.g., the Jews as inferior race during the Third Reich, intellectuals as anti-collectivist elements in Cambodia, Muslims as "genetically defect material" in Bosnia, and Tutsis as "cockroaches" in Rwanda – which frame genocidal actions in a way that makes it acceptable for the broader masses of society (Kuper 2002). They use a variety of scientific – or more often pseudo-scientific – ideas to justify and set the scene for later atrocities. Because they are "scientific" and promoted by people with a level of authority and expertise, they have a weight and power that would otherwise be lacking. These ideas are subsequently disseminated by intellectual elites such as scientists, doctors, and other professionals whose status gives weight and importance to their pronouncements (Hassner 1997).

Under the Nazi regime, for instance, medical professionals created a body of knowledge that was used as lethal instruments against Jews (Grodin and Annas 2007). They identified Jews as carriers of diseases and in fact as disease themselves. Typhus became known as a Jewish disease or *Judenfieber*. The two modern discourses, social Darwinism and Eugenics, gave the scientific backing for the elimination of "non-fit" individuals and groups from society and developed new techniques for more "rational" and "hygienic" killings. After such a systematic preparation, the Nazis were able to portray their discriminatory and genocidal actions as necessary to maintain the health and welfare of the German society (Friedlander 1995).

In a similar vein, the Memorandum of the Serbian Academy of Sciences and Art set the stage for a resurgent Serb nationalism years before ethnic cleansing and genocide actually took place. Published in 1986, the memorandum detailed a long list of "injustices" suffered by Serb people. It built on the nationalistic sentiments Serb intellectuals and academics had begun expressing in the 1970s and meetings of members of the Serbian Academy since 1983 to discuss the situation in Yugoslavia (Lampe 2000). The Memorandum asserted that, "...in less than fifty years, within two consecutive generations, twice exposed to physical annihilation, forceful assimilation, religious conversion, cultural genocide, ideological indoctrination, invalidation, and denunciation of their own tradition under the imposed complex of guilt, intellectually and politically disarmed, the Serbs were exposed to temptations that were too great not to leave deep scars on their spirit." Additionally, it asserted that "Serbs have a historic and democratic right to establish fully national and cultural integrity independently, regardless of republic or province in which they live" (Sugar 1995; Cigar 1995).

Essentially, the document legitimated the policies and actions of the ethnic cleansing and genocide which were to follow. From the Serb nationalist perspective, the perpetrators were not committing crimes against innocent people and their neighbors, but merely defending their people and asserting their rights (Anzulović 1999; Halilovich and Adams 2011). A similar pattern existed in the Rwandan and Cambodian genocide (Melvern 2004; Hinton 2002).

## Genocide as a "Legalized" Crime

Another powerful vehicle in legitimizing policies of persecution is the law and the modern legal system. By definition, everything that is proclaimed legal is legitimate and everything that is categorized as illegal is illegitimate. The Holocaust happened only after legal initiatives had over the years deprived Jews of their professions, their possessions, and their rights. Once their rights were removed, anything could and did happen to them (Glover 1999).

Similarly, during the 1990s in Bosnia, legal officials in the occupied parts of the country, self-declared as the Republika Srpska (Serb Republic), and enacted laws depriving the largest Bosnian ethnic group, the Bosniaks (Bosnian Muslims), of their rights and legal protection (Cigar 1995). Together with the Bosnian Croats and other non-Serbs, they were banned from management and senior positions in large businesses. Moreover, they were subjected to a 4 pm curfew and were banned from gathering in public places, making contact with relatives who did not live in the town, driving or traveling by car, selling real estate without going through Serb authorities, or leaving without permission (Maas 1996).

By legitimizing the discrimination and oppression, the Serb authorities pressured the non-Serb population into leaving Serb-controlled territory (Cigar 1995; Halilovich 2013). These legal decrees had the effect of socially and economically marginalizing the non-Serbs, making them vulnerable to more extreme measures that included being rounded up in concentration camps and physical extermination in summary. In Rwanda, Tutsis were subjected to similar policies imposed by Hutu nationalists, who killed 800,000 Tutsis and moderate Hutus within 100 days (Prunier 1998; Melvern 2004), while in Cambodia the Khmer Rouge regime established strict legal protocols as a part of the killing machinery which took the lives of two million people (Caswell 2014; Hinton 2002).

In all these cases of genocide, the law, instead of protecting the victims, was used as a tool of propaganda and incitement to violence, lending credibility to certain groups, actions, and behaviors and delegitimizing others. The ability to legally define certain people as criminals is to take away not only their rights, but also their identity as citizens. Criminals are by definition perceived as different and alien from the "law-abiding" and "decent" citizens of a society. The perpetrators of genocide, protected as they are by the state and its laws, see themselves as "good citizens" engaged in patriotic service to their nation. The victims of genocide, on the other

hand, are portrayed as devious and enemies who pose a threat to those being asked to kill them. In many cases, propaganda reverses the roles of victims and perpetrators, portraying victims as perpetrators while honoring perpetrators as innocent victims (Halilovich 2011). In other words, killers are provided with ideologies and propaganda that alter perceptions of reality in order to justify their behavior.

## Recognizing Stages of Genocide

Based on the discussion above, it is not difficult to agree with Gregory Stanton, a genocide scholar and President of Genocide Watch, an organization dedicated to identifying and preventing genocides, when he writes that genocide does not just happen, but represents a process. According to Stanton, this linear process develops in ten stages, and, ideally, by recognizing these different stages, we should also be able to develop preventive measures to stop genocide (Stanton 2017).

The stages involve the following set of actions:

1. Classification: creation of categories to separate people into "us" and "them" according to ethnicity, race, religion, or nationality.
2. Symbolization: giving derogatory names or using symbols for the targeted social groups.
3. Discrimination: using law, custom, and political power to deny the rights of other groups on the basis of nationality, ethnicity, race, or religion.
4. Dehumanization: denying humanity to members of other groups by equating them with animals, vermin, insects, or diseases.
5. Organization: behind every genocide there is a high level of organization and planning, usually by the state, often using militias to provide deniability of state responsibility.
6. Polarization: allowing extremists to drive the groups apart, dividing propaganda and hate speech, laws may forbid intermarriage or social interaction, intimidating and silencing the moderates from within the dominant group.
7. Persecution: identifying and separating victims based on their ethnic or religious identity, drawing up death lists, forcing members of victim groups to wear identifying symbols, expropriation of property, demographic segregation into ghettoes, deportation into concentration camps, or confinement to a famine-struck region and starvation.
8. Preparation: national or perpetrator group leaders plan the "final solution" to targeted groups, often using euphemisms such as "ethnic cleansing," "purification," or "counterterrorism"; building armies, buying weapons, and training their troops and militias.
9. Extermination: involves mass killing of the members of the target group by armed forces and militias.
10. Denial: the perpetrators of genocide dig up the mass graves, burn the bodies, try to cover up the evidence, intimidate the witnesses, block investigations of the crimes, deny that they committed any crimes, and often blame what happened on the victims (Stanton 2017).

If unpunished, genocide can also result in an eleventh stage. Building upon Stanton's ideas and basing it on my research on genocide in Bosnia, I call this stage "triumphalism." In this stage, perpetrators, their sponsors, and the politics behind genocide do not deny the killings anymore, but glorify them, celebrate their deeds, humiliate the survivors, build monuments to the perpetrators at the sites of the massacres, and create a culture of triumphalism such as has been seen in the parts of Bosnia where Serb militias committed genocide against Bosniaks (Halilovich 2011, 2013).

## Conclusion

Rather than cataloging all the cases of genocide and providing precise demographic, historical, or statistical records of them, this chapter has attempted to reiterate the connection between modernity (and globalization) with this most heinous form of politically motivated violence. To

paraphrase Baumann, genocide might not be directly caused by globalization – genocidal violence is usually very local and regional in its scope (Halilovich and Adams 2011) – however, neither is "liquid modernity" immune to the crime of all crimes. If anything, globalization typified by modern information and communication technologies has made us more aware of genocidal acts taking places in different corners of the globe, which in turn should make us all feel not just unconformable about having this knowledge, but also responsible to stop genocide. In this day and age, we cannot resort to saying to future generations: "we did not know what was going on."

## Globalization and Global Trade

Dean Coldicott
School of Humanities and Social Sciences, Deakin University, Burwood, VIC, Australia

Trade is central to the process of globalization, as both a driver of globalization and a measure of the levels of global integration. States pursue freer international trade with the underlying intention of specializing in the production of goods and services they are proficient in generating while importing other goods and services they require. This trade by comparative advantage has been shown to create economic growth (Ortiz-Ospina and Roser 2016). This principle is the impetus for globalizing trade by states; however the growth generated is not experienced evenly within states, creating winners and losers from trade.

### Globalization

For many globalization is indistinguishable from an increasingly interconnected world economy. For others globalization is a much more complex phenomenon with patterns of integration and fragmentation that impact upon and is evidenced across many intersecting areas of human activity from the economic, political, legal, and ecological to the cultural and beyond (McGrew 2008, p. 256). The economic aspects of globalization are however of primary importance and perhaps none more so than that of increasingly global trade.

There is a discernible historical trend toward the globalizing of the world economy. Trade is a primary cause and one of the primary measures of this tendency. Having stated this, it must be noted that this globalizing trend is experienced unevenly within and across state borders. The scope, meaning, and effects of globalization of the world economy remain areas of disagreement within both the academic and wider community (McGrew 2008). The increase in the volume of trade and the deepening networks of trade are evidences of this interconnectedness that is driving processes of globalization, particularly economic globalization. These processes or tendencies are leading toward the development of a singular global economy. The current era of economic globalization has over the last three decades weathered numerous international economic shocks, the East Asian Financial Crisis and the 2008 Global Financial Crisis, that suggests an inherent resilience that some have argued is socially and institutionally embedded within international society. This resilience does not imply that economic globalization is unstoppable or irreversible, it does however suggest that it is a dominant tendency in the emerging global economy (McGrew 2008).

### International Trade: The Early Years

Trade can be seen to become much more internationally interdependent over the course of the last few centuries after a long period of consistently low levels of international trade. The first wave of globalization, caused by the technological advances of the industrial revolution, witnessed a significant growth in international trade. The violent upheaval of World War I halted this increase in trade which was then reversed by the Great Depression and the associated trade policies of states of the time (Ortiz-Ospina and Roser 2016).

The beginnings of the modern world economy can be traced to the late fifteenth and early sixteenth centuries. At this time, absolutist sovereign

states used international trade as a means to increase their material wealth and power by amassing resource reserves, especially gold, and focusing on creating trade surpluses at the same time as attempting to keep imports in check. Trade monopolies were created within colonial spheres of influence by the most powerful states, spreading the reach of international trade well beyond neighboring states (O'Brien and Williams 2016). Until the nineteenth century, international trade levels were routinely low with the total of all imports and exports never breaking 10% of world production in the years before 1800 (Ortiz-Ospina and Roser 2016). The main exception of this emergent period of international trade is the Netherlands, where trade was becoming an important component of the economy during the seventeenth century (Ortiz-Ospina and Roser 2016).

The industrial revolution increased the pace of internationalization of trade primarily through the advancement of manufacturing, transport, and communication technologies. These advancements enable faster and more efficient trade as well as a subsequent and even faster extension of the international division of labor. Over the course of the nineteenth century, trade dramatically increased; particularly from the 1870s, trade increases more quickly than production increasing the interdependence of economic markets (O'Brien and Williams 2016). Trade was internationalizing at an increasing rate. Within this increase, trade tended to be interindustry, meaning that countries were importing and exporting vastly different (Ortiz-Ospina and Roser 2016).

International trade volumes increased year on year by more than 3% for more than a century from 1800 to 1913 (Ortiz-Ospina and Roser 2016). By the early twentieth century, international trade had increased its expansion to the point where three regionally based core-periphery economies had developed centered in Western Europe, the United States, and Japan. These core economies had become the major manufacturing exporters with their related peripheries providing them with resources for this production. Trade at this time tended to be bounded within these regions with trade between the core economies kept low through the use of tariffs. Trade could be considered to be continuing to be increasingly interdependent internationally; however this tended to be more regionally based rather than global (O'Brien and Williams 2016). It is also important to note that at this point, a significant amount of increasing international trade could be accounted for within Europe (Ortiz-Ospina and Roser 2016).

World War I significantly interrupted the momentum of increasing trade integration of the previous centuries. European economies were devastated by the war, with recovery dampened further by the reparations Germany were required to pay by the British, in addition to the loan repayments by other European countries to the United States (O'Brien and Williams 2016). World War I marks the end of the "first wave of globalization", as a trend toward nationalism and the accompanying protectionist trade policies replace what had been an increasingly liberal and integrated internationalizing world economy (Ortiz-Ospina and Roser 2016).

Trade barriers increased in the interwar years, setting back the internationalization of trade even further. This phenomenon contributed to international economic instability, along with a lack of leadership from within the financial system, and a rising working class that were no longer willing to tolerate the economic pain of domestic market corrections (O'Brien and Williams 2016). The result was the Great Depression of 1929 that saw the United States and then its trading partners raise tariff barriers to their highest levels. This activity saw a steep decline in international trade by more than 60% in 5 years, with the rest occurring within colonial spheres. The United States eventually reversed this trend in the late 1930s by negotiating trade agreements with 20 of its major trading partners. These negotiations can be seen as a precursor to the post-World War II General Agreement on Tariffs and Trade (GATT) regime.

Toward the conclusion of World War II, states began to engage in planning for a new international economic architecture that would avoid the mistakes of the interwar years and reestablish the

trajectory of a liberal international economy through the creation of multilateral treaty-based institutions. These institutions were the International Monetary Fund (IMF), the International Bank for Reconstruction and Development (World Bank), and the failed International Trade Organization (ITO). The IMF and World Bank were created in 1944 at the Bretton Woods Conference, while the ITO and its General Agreement on Tariffs and Trade (GATT) were agreed to in 1947 at the United Nations Conference on Trade and Employment in Havana, Cuba. The ITO failed to receive the required level of ratification from state members, as a consequence the GATT regime moved forward in place of the ITO as a quasi-trade organization. The GATT was designed to be administered by the ITO which had a much larger mandate in the area of international trade governance.

## GATT

In spite of the failure of the ITO to materialize, the GATT represented the institutionalization of the liberal trade regime, and once again trade began to internationalize at an increasing pace. The world economy gathered pace in the decades following the creation of the IMF, World Bank, and GATT; within this period, trade increases at a more rapid rate than production.

The GATT operated by negotiating rounds among its contracting parties, beginning in 1947 with the Geneva Round with the original 23 contracting parties, through Annecy 1948, Torquay 1950, Geneva 1956, Dillon 1960–1961, Kennedy 1964–1967, Tokyo 1973–1979, to ultimately the Uruguay Round 1986–1994. By the Uruguay Round, the GATT had reduced the average tariffs on imports of goods from 40% to an average of approximately 5% (Winham 2008). By 1994, trade volume had risen to above 40% of world production (World Bank). This rise in world trade volume was at an increased pace than that witnessed in the nineteenth century, and trade has been uneven across countries; however the trends have been positive in most countries (Ortiz-Ospina and Roser 2016). With the success of the GATT in reducing tariffs for trade in goods, the contracting parties turned their attention during the Uruguay Round to expanding the scope of the regime to include services and intellectual property rights. As the negotiating round progressed, the idea of an international organization to administer the international trade regime was once again canvassed and agreed upon by the 123 signatory states with the Marrakesh Agreement establishing the World Trade Organization (WTO) at the conclusion of the Uruguay Round in 1994.

After 50 years of trade negotiations under the GATT that had significantly reduced tariffs, the WTO emerged in 1995 to take the principal role in removing national barriers to international commerce. The WTO embarked upon ambitious new areas of trade rules that have a much greater impact on other spheres of human life. With the completion of the Uruguay Round, negotiations of the international trade regime shifted significantly into a new era. Along with the renegotiated GATT agreement, the newly formed WTO also had the General Agreement on Trade in Services (GATS) and Trade-Related Aspects of Intellectual Property Rights agreement (TRIPS) to administer, greatly expanding the scope and reach of the organization.

## WTO

The WTO formally came into being on 1 January 1995. It is both an evolution of the GATT regime and a revolution. It is an evolution in that it institutionalizes many of the principles and customary practices of the GATT and continues much of its previous work and realizes the ambitions of the post-World War II economic institutional architects. It is a revolution in that the much-expanded scope of the WTO, particularly into services and intellectual property coupled with the legally binding dispute settlement mechanism, makes the new organization incredibly far-reaching and powerful.

The WTO has a broad mandate and the ability to enforce its rules; this is a tool that most international organizations lack and has led to pressure

and tensions with overlapping policy areas and concern of jurisdictional overreach. The WTO was thrust into the public eye with the failed ministerial meeting in Seattle in 1999 where politics both inside and on the street halted what was supposed to be the beginning of a development round.

The membership of the WTO has expanded from the 123 original members at the inception of the WTO in 1995 to 164 as of 29 July 2016. Within a very brief period, the WTO quickly assumed a central role within the international system envisaged for such a multilateral organization in the aftermath of World War II a half-century earlier. Through its Ministerial Conferences and ongoing negotiations, the WTO is now the setting for writing and rewriting the baseline rulebook of global trade and commerce. During this rise the WTO has been a victim of its own success in that it has attracted debate and contestation over a myriad of issues from an equally diverse group of state and non-state actors. As such it has born witness to an increasingly complex multilateral approach to global economic and political governance.

The early rounds of negotiation within the WTO sought to resolve many of the holdover issues from the Uruguay Round of the GATT. This momentum was essentially brought to a halt with Doha Development Round of 2001, with negotiations still dragging on almost two decades later. Even though negotiations have gone into a deep freeze, the trajectory of world trade has continued on the upward trend with total trade as a percentage of global production at almost 60% (World Bank). With this new era of trade interdependence, we are also witnessing a difference in what is being traded. Whereas nineteenth-century trade was predominantly interindustry trade, contemporary world trade is predominantly intra-industry trade. That is, post-World War II to today countries are now much more likely to be importing and exporting similar goods (Ortiz-Ospina and Roser 2016).

Negotiations within the WTO may have come to a deep freeze; however, the WTO has remained a pivotal forum for resolving trade disputes, with more than 500 complaints resolved through its dispute settlement mechanism (DSM). Early complaints in the DSM settled some major points of difference between the large developed economies, whereas the DSM has become widely used by WTO members, developed and developing alike (WTO 2017a). The issues in the Doha Round are proving very difficult to overcome among WTO members; however this does not mean that progressive trade liberalization and integration has come to a standstill. Parallel to the development of the WTO has been a proliferation of regional and bilateral preferential trade agreements that have propelled the momentum of global trade even further. During the period 1948–1994, contracting parties notified the GATT of 124 preferential trade agreements. During the period 1994–2017, the WTO has received 647 notifications of preferential trade agreements from its members (WTO 2017b). This suggests that preferential trade agreements are an important aspect of the globalizing trade regime even if the notion of their existence runs counter to the principles of the WTO.

## Bilateral, Regional, and Plurilateral Trade

Due to the stalemate in WTO negotiations, the framework for progressing the rules and norms of the international trade regime has shifted to bilateral, regional, and plurilateral trade forums in the last two decades. The difference in the approach of developed states that are pursuing increased trade liberalization and emerging states that continue to see an important role for government intervention in trade policy has largely contributed to the deep freeze within the WTO and other multilateral forums (Miller 2014). The response to this has been a proliferation of bilateral, regional, and plurilateral preferential trade agreements in pursuit of these goals.

Bilateral, regional, and plurilateral trade agreements are preferential or discriminatory trade agreements. This is in contradiction to the notions of free trade and nondiscrimination that are at the heart of the WTO's liberalizing trade regime that is enshrined in the principles of most-favored

nation and national treatment. Despite this inherent contradiction between the liberalizing WTO regime and the discriminatory nature of preferential trade agreements, the WTO and the GATT before it made allowances for these agreements through GATT Article XXIV, the enabling clause for preferential trade agreements between developing states, as well as the GATS Article V.

These allowances however require WTO members, and GATT contracting parties previously, to notify the organization of any preferential trade agreements they are party to. To date nearly all WTO members have notified the WTO of their involvement in at least one preferential trade agreement. A number of members have notified their engagement in more than 20 such agreements. WTO members engage in preferential trade agreements for a number of reasons even though it would be more politically efficient to conclude a large multilateral trade agreement rather than numerous bilateral, regional, and plurilateral agreements. The principle reason may be that it is easier to negotiate with smaller numbers of like-minded trade partners rather than trying to reach agreement among a large multilateral group. In terms of domestic political constituents, it can be easier for leaders to receive support for reciprocal trade agreements rather than attempting to explain the more complex benefits that accompany a larger trade agreement requiring unilateral reductions of tariffs. Bilateral and regional agreements may also improve relationships between states to improve regional security and economic stability. Preferential trade agreements can also create a larger market that can be attractive to investment, particularly from multinational corporations and multilateral development agencies. Many preferential trade agreements also go beyond trade policy, focusing on other areas that remain contentious within the WTO such as investment, environmental, and labor standards. Furthermore, electronic commerce has come a considerably long way since the inception of the WTO where it was largely in its infancy. Given the glacial pace of WTO negotiations, it should not come as a surprise that the rules and principles for trade in electronic goods and services have been developed primarily through preferential trade agreements where US trade negotiators have been very active in developing and cultivating the rules and practices in these areas through cumulative preferential trade agreements (Miller 2014).

Esteban Ortiz-Ospina and Max Roser (2016) illustrate that the vast majority of contemporary trade relationships are now bilateral, where most countries tend to export to and import from the same country (Helpman et al. 2007). Furthermore, much of the growth in world trade in the 50 years post-World War II was experienced within bilateral trade, even though many countries in the world do not still trade with each other (Ortiz-Ospina and Roser 2016).

During the GATT period (1947–1994), much of the preferential trade agreement activity was directed at linking developing countries together. In response to the processes of decolonization, African regionalism began to develop in the early 1960s. At the same time, regionalism began in earnest in South America, while the pace was much slower in the Asian region with the major exception of the development of the Association of South East Asian Nations (ASEAN) (O'Brien and Williams 2016). Regional trade agreements of this time were vehicles of state-led industrial development that fostered import substitution and sought to improve the negotiating power of member states with other regions, larger economies, and multinational corporations. Many of these regional agreements broke down relatively quickly, particularly in Africa, as the structure of the economies was historically created by colonial rulers to provide raw commodities to core economies. This had resulted in very low levels of trade between the states creating these regional trade agreements. The signing of these agreements did nothing to change this experience. The agreements did not generate significant benefits for members; in some cases this increased inequality between signatories to the agreements. Lesser developed members were not only forgoing the income from tariffs, but also the expected development benefits passed them by for the relatively better developed partners with superior infrastructure (O'Brien and Williams 2016). The eventual outcome of the

uneven distribution or relative lack of benefit from this regional trade agreement activity led to the breakdown and abandonment of many of these arrangements. Combined with the sluggish pace of the European Community and the economic shocks of the 1970s, regional trade and more broadly regional economic cooperation significantly slowed down until the end of the Cold War when a new emphasis for cooperation and change began to flourish yet again.

The end of the Cold War brought with it the opportunity to realize the vision of global economic interdependence that drove the creation of the IMF, the World Bank, and the GATT. Within this context new regional and bilateral trade agreements were created with a view to strengthen global economic interdependence. Preferential trade agreements in this instance were designed as a stepping stone toward the global economy for many former Soviet Bloc states seeking access to developed state markets as well as foreign investment (O'Brien and Williams 2016). Rather than being largely among developing nations, this second wave of preferential trade agreements in the late 1980s and early 1990s tended to include both developing and developed states.

Of particular note is the North American Free Trade Agreement (NAFTA) involving Canada, Mexico, and the United States that was negotiated and signed in parallel with the Uruguay Round of the GATT that established the WTO. The European Union (EU) gained momentum, and many developed countries entered into negotiations with the EU on preferential trade agreements, as many developing states began to establish preferential trade agreements with developed states such as Japan and the United States. The further economic and political integration of Europe into a single economic market can be viewed as a project to strengthen European-based multinational corporations in the face of an increasingly global economy (O'Brien and Williams 2016).

The significant rise therefore in preferential trade agreements, particularly since the emergence of the WTO, can be viewed as both a reflection of division within the WTO between the large and emerging trading economies in addition to a developmental tool for states to integrate into the globalizing world economy and a space for some states to increase the pace of trade and economic interdependence that they are unable to pursue at the multilateral level.

Since the 1980s, bilateral trade has continued to increase between developing states, while the proportion of trade between developed states has declined. For the period between 1980 and 2011, bilateral developing state trade volumes increased by more than 300% driven largely by China's increasing trade activity (Ortiz-Ospina and Roser 2016). In order to feed its own development, China has increased its trade with sub-Saharan African states from $1 billion in 1992 to $140 billion in 2011 (Ortiz-Ospina and Roser 2016; UNDP 2013). The emergence of trade and preferential trade agreements between developing states has been a significant trend in the last 30 years over the same period of time that we have seen increased institutionalization at the multilateral level. By the late 1970s, the majority of preferential trade agreements were between developed and developing states. By 2010, these "North-South" agreements made up approximately 25% of the total. The WTO reports that preferential trade agreements are more and more likely today to be between developing states (WTO 2011). Perhaps more importantly, this increase in trade and trade agreements between developing states has been accompanied by a change in the goods and services that are being traded. In particular, the reliance on food exports appears to be declining for a number of developing states (Ortiz-Ospina and Roser 2016).

The activity of a number of states in the area of preferential trade agreements around the Pacific Ocean cascaded into the start of negotiations for a Trans-Pacific Partnership Agreement (TPP) in 2008 between Australia, Brunei, Canada, Chile, Japan, Malaysia, Mexico, Peru, New Zealand, Singapore, the United States, and Vietnam. These plurilateral negotiations concluded in late 2015; however the agreement has yet to come into force, and its status at present is not clear as the commitment of the United States remains in question (BBC 2017). The TPP is an attempt by the member states to pursue increasing levels of trade and investment interdependence based upon the principles and rules that have grown through the accumulation of preferential trade agreements between them. The TPP was designed by these

states to harmonize rules in areas such as e-commerce, state-owned enterprises, government procurement, investment, health, environmental and labor standards, intellectual property, and customs cooperation (DFAT 2017; Miller 2014). These provisions were made with the view to other members joining the TPP or implementing similar approaches and disciplines into other agreements and effectively establishing the direction for many of the areas that have not been dealt with effectively or at all within the WTO framework. In this context, Scott Miller (2014) suggests that the TPP, or something like it, represents the most likely scenario for developing a new trade architecture in a more "organic, bottom-up fashion" rather than holding out hope for a breakthrough within the multilateral framework of the WTO.

From the discussion above, it is clear that despite a globalizing tendency and a significant increase in the volume of world trade, bilateral, regional, and plurilateral trade is an important aspect of world trade that is not necessarily globalizing in nature. Corresponding to the increase in trade volume has been an increase in preferential trade agreements that by design are discriminatory rather than liberalizing (globalizing).

## Global Trade

The growth in volume of world trade has risen exponentially from the industrial revolution through to the contemporary period, so much so that the interwar decline in trade in the 1930s virtually disappears when viewed at this scale (Ortiz-Ospina and Roser 2016). There appears to be a convincing positive relationship between increasing levels of trade and economic growth; however Ortiz-Ospina and Roser (2016) caution that this is not necessarily a causal link as there are clear differences in trade openness across countries. Some countries may experience economic growth for reasons other than international trade while at the same time increase their trade. Frankel and Romer (1999) argue that there is a causal link between international trade and economic growth; however the direction between the two cannot be identified (does trade cause growth or does growth cause trade). Frankel and Romer further argue that geographic distance has a strong impact on economic growth from international trade; however others have noted other important factors for trade and economic growth in particular the institutions of property rights and the rule of law (Alcalá and Ciccone 2004; Ortiz-Ospina and Roser 2016; Rodrik et al. 2004).

The WTO's *World Trade Statistical Review 2016* (2016) provides an overview of the volume and trends in international trade, particularly over the period 2005–2015 that provide an insight into the makeup of "global" trade. The total value of annual world merchandise trade and trade in commercial services has risen from just under 14 trillion US dollars in 2005 to a high of over 24 trillion US dollars in 2014 with a decline to just under 22 trillion US dollars in 2015 (WTO 2016, p. 10). The WTO (2016, p. 11) attributes much of the 2015 decline to a decline in world commodity prices, particularly in the energy sector. This decade-long trend suggests a significant globalization of world trade given the near doubling of value of trade in goods and services in line with the longer-term trends discussed above. Beneath the world aggregate trade statistics, there is much more to the story than simply an increasingly globalized trade system. In 2015, China, the United States, Germany, Japan, and the United Kingdom were responsible for over one third of world trade with China, the United States, and Germany controlling more than one quarter of world trade (WTO 2016, p. 42).

In addition to the trading dominance of these states, 52% of all goods trade in 2015 occurred across ten economies. Fifty-three percent of commercial services trade in 2015 also occurred across ten economies (WTO 2016, pp. 14, 5). Not only is there a concentration of international trade among major trading nations; there are two other factors worth noting when trying to comprehend the nature of "global" trade: geography (the tyranny of distance) and production (global value chains).

Despite the trend toward a globalizing of international trade, geographical distance appears to maintain a gravitational impact upon trade flows with increasing distance (Eaton and Kortum 2002; Ortiz-Ospina and Roser 2016). Jonathan Eaton and Samuel Kortum (2002, p. 1775) have shown that geographic distance is still linked to the intensity

and volume of trade patterns and that these links are not simply a correlation but rather that despite the globalizing comparative advantage-driven practices of liberalizing trade, geographic barriers continue to restrict trade flows.

In addition to the continuing brake that geography places upon world trade, it is important to note not only which are the major trading economies but also what is being traded and by who. Transnational corporations (TNCs) are the majority of international producers and traders in raw materials, intermediary goods and services, as well as finished goods and services. In 2013, the United Nations Conference on Trade and Development (UNCTAD) *World Investment Report* found that 80% of world trade was coordinated by TNCs' global value chains. That is, the world economy is defined by global value chains where "intermediate goods and services are traded in fragmented and internationally dispersed production processes" that are usually controlled by TNCs "with cross-border trade of inputs and outputs taking place within their networks of affiliates, contractual partners and arm's-length suppliers" (UNCTAD 2013, p. x). The rise in intermediate goods and services trade has been rapid with the Organization for Economic Cooperation and Development (OECD) reporting in 2009 that intermediate inputs made up 56% of goods trade and 73% of services trade, respectively (Miroudot et al. 2009). These activities by TNCs across borders yet within their own structures distort the world trade figures and make it very difficult for economists, observers, and policy makers to comprehend and make meaning out of "global" trade.

## Conclusions

International trade has experienced exponential growth historically that accelerated in the post-World War II GATT system, only to accelerate even more rapidly within the WTO system. If we end the story there, we could conclude that the world is globalizing and that global trade data affirms this. However, if we look more deeply into where this growth is experienced, we can see that trade is intertwined with increasingly regionally focused trade agreements as well as global systems of production and investment primarily though the actions of TNCs. These are sometimes complimentary and sometimes contradictory forces that shape the world economy and condition the systems of international trade.

Trade remains central to the process of globalization. Globalizing trade is a principle driver of globalization. Trade flows and patterns are an important measure of the levels of global integration. States continue to pursue freer international trade with the underlying intention of specializing in the production of goods and services they are proficient in generating while importing other goods and services they require. This has led to economic growth; however, as has been shown in the above discussion, the levels of trade integration are very uneven. A small number of states account for the majority of world trade. Most trade is concentrated in small groupings of states, often on a bilateral basis, despite the multilateral trade architecture developed within the GATT and then extended within the WTO. Geographical distance remains a constraint on trade in goods and services, although this is less so within TNC-controlled global value chains. Much of the growth in global trade of the last decade can be attributed to the vertical integration of the development of these global value chains (UNCTAD 2013).

When we speak about globalization and global trade, it is important to understand that we are not talking about one phenomenon or one process. We are looking at global, regional, and national forces involving complex networks that have economic, political, and cultural impacts.

## Globalization and Globalism

Richard L. Harris
California State University, Monterey Bay, CA, USA

The sociologist Cesare Poppi (1997: 285) has noted that: "The literature stemming from the debate on globalization has grown in the last decade beyond any individual's capability of extracting a workable definition of the concept." But like many others who have grappled with the definition of globalization, Poppi does end up describing globalization as both an important historical process as well as a contested discourse about the global nature of human society. The contemporary literature and ideological debates on globalization and globalism involve a highly contested, complex, and multidimensional discourse on the nature of the present world order, its historical antecedents, underlying causative forces, and future evolution. Most theorizing and empirical research on this subject tends to be organized around the following key issues or questions: is globalization really taking place on a global scale; is it producing global convergence and integration or divergence and fragmentation, or both; is it undermining the authority and power of nation-states; will globalization continue to characterize the present era of human history; if so how does the present era of what some call "globality" differ from modernity (or postmodernity); and are globalization and globalism producing a single global culture and a global political system as well as a global economic system?

Generally speaking, globalization is regarded as a global (planet-wide) process of increasing cross-border flows of products, services, capital, people, information, and culture. Many observers call attention to the effects this global process is having on our sense of time and space. Roland Robertson (1992: 8) has argued that globalization "refers both to the compression of the world and the intensification of our consciousness of the world as a whole." Manuel Castells (2001: 52) has stressed the instantaneous informational and communications aspects of globalization and characterizes the global economic system that has emerged as a result of the information revolution as an economy with the capacity to work as a single unit in real time on a planetary scale. In the developing countries of the Global South, there are many "locals" who characterize globalization as the third phase of Western colonization (the second phase being neocolonialism), and they criticize the many negative local effects of globalization (e.g., see Adesina 2012). "Globalism" is generally used to refer to ideologies that advocate

globalization of one kind or another. "Globalists" advocate for globalization and they often favor freedom of immigration, free trade, lowering tariffs, humanitarian interventionism, democracy, human rights, global citizenship and/or global governance. Globalism and globalists are increasingly viewed as the opposite of nationalism and nationalists, and the clash between these two has become increasingly divisive in the politics of many countries (Miller 2017).

It is important to emphasize that globalization tends to be used to describe global integration that is occurring with increasing intensity "inside" societies and states as well as "between" them and the evolving global system (Robertson 1992: 104–105). In addition, it appears globalization gives rise to "glocalization." This concept is an amalgam of the terms globalization and localization and is used to refer to the end process in which global phenomena are adopted/imposed and then adapted and differentiated at the local level. It can be argued that in a very real sense all global phenomena originate in some location(s) of the world and become global (globalized) through distribution and/or diffusion to an increasing number of other locations around the world, where they take root and then become locally differentiated (localized) in the local conditions they encounter. In this conceptualization of the globalization process the localized variations of the globalizing phenomena are always a mixture or hybrid produced by the dynamic interaction (glocalization) that takes place between the global phenomena and the local conditions these phenomena encounter. The work of the well-known sociologist Roland Robertson (1991, 1994, 2009) has done the most to develop and popularize this important conceptualization of the transnational social transformations that are now regularly taking place around the globe and producing increasing hybridity.

## Globalization and Governance

A variety of structures promote, coordinate, and/or regulate economic globalization at the global level, e.g., the World Trade Organization (WTO), while others promote and regulate economic integration at the regional level. The best example of regional integration is the European Union (EU), and there are a growing number of regional organizations in other parts of the world (see below). They generally facilitate globalization by providing an intermediate level of integration between the local and global levels. Thus, various forms of economic integration are taking place at the same time within the overall process of global integration. The connecting linkages and coordination between these parallel processes of integration are provided by large transnational banks and corporations and to a lesser extent by intergovernmental entities such as the International Monetary Fund (IMF), World Bank, WTO, World Health Organization, and other similar international organizations. The latter can be considered emerging forms of global governance.

The existing system of nation-states is to a certain extent being transformed by the emerging global or globalizing structures, particularly by the large transnational corporations and the intergovernmental institutions such as the IMF, World Bank, WTO, and regional associations such as the EU (Cole 2017). The nation-states continue to be important structures and actors in the emerging global economic and political system, but their position in this system is increasingly subordinate to the complex array of transnational corporations and intergovernmental institutions which exercise increasing control over not only economic but political, social, cultural, and environmental conditions at the national and subnational levels (e.g., "global cities") of the emerging global order. In this multilevel global order, contemporary political and economic thought and action appear to be increasingly influenced by what Robertson refers to as "a globe-wide system of rules and regulations" and "a consciousness of the global economy as a whole" (Robertson 1992: 26). In fact, the decisions and actions of the main actors at the national and international levels of this emerging global order are clearly influenced to a considerable and increasing degree by their awareness of and concerns about the global economy.

Western/Northern economic, political, social, and cultural values, ideals, and interests are dominant in the contemporary globalization process

(Cole 2017). As a result, some critics call this process "globalization from above" or Western imperialism since it is essentially a top-down process of capitalist expansion and integration that is largely directed and imposed by the transnational corporate elites and their political allies in the Global North. In contrast, the opposing proponents of "alter-globalization" tend to represent the interests of the world's poor, working poor, and many social movement activists from both the Global North and the Global South. The latter tend to believe "Another World is Possible" (the slogan of the World Social Forum) and they advocate what some call "globalization from below." They seek to co-create an environmentally sustainable global order that reflects the interests of the majority of the world's population and that protects and preserves the planet's biosphere. The various social forces involved in this effort are sometimes referred to as "global civil society" and the "global social justice movement," which is an evolving and vast assemblage of environmental and social justice movements with overlapping interests operating across the world and beyond the reach of governments (Keane 2003). Many of them send delegations to the World Social Forum (WSF), which is the largest international gathering of global civil society representatives. They meet at the WSF to find solutions to "the problems of our time." The WSF started in 2001 in Brazil, and it brings together at each of its meetings tens of thousands of participants who engage in hundreds of workshops, conferences, artistic performances on various themes such as creating a solidarity economy, environmental sustainability, human rights, democratization, etc.

As far as the role of the state and public administration in the evolving global order are concerned, there in increasing evidence they are being affected dramatically by the globalization process (Srivastava 2009). A series of political and administrative reforms have taken place since the late 1970s under the aegis of globalization and the neoliberal ideology of the transnational corporate elites in the Global North and their allies in the Global South (Cole 2017). As Ali Farazmand stated in his seminal 1999 article on globalization and public administration: "the nature of the administrative state worldwide" has been changed by both globalization and globalism, and "the globalized economic structure, with its many superstructural changes, including superterritorial power structures, has led to profound implications for public administration" (Farazmand 1999: 510). Jamil Jreisat (2009) contends in this regard that: "the globalization processes underscore the urgency for adopting reforms [in governance and public administration] that work" in the globalized economy, and to do this successfully "public administrators have to expand their intellectual horizons, refine their operational methods, improve their communications and negotiation skills, and conform to higher standards of performance in all aspects of their responsibilities" (Jreisat 2009: 47).

Policy makers and administrators, influenced by the transnational corporate elites and their neoliberal ideological prescriptions, have promoted the deregulation of both commercial and financial markets by the state as well as the piecemeal privatization and reduction of the size and scope of the public sector in countries around the world, especially the privatization of social services. These so-called reforms have taken the guise of corporate managerial and entrepreneurial innovations with euphemistic labels such as New Public Management, which are generally distinguished by out-sourcing public services to private enterprises, public-private partnerships, and the privatization of public property and many public goods (Mohanty 2014). These so-called reforms use corporate managerial jargon and profess to treat the beneficiaries of public services as customers and the citizenry as shareholders. They have placed the emphasis on using private enterprise, private contractors, markets and marketing, business administration principles, and public sector partnerships with private and nonprofit organizations while at the same time reducing public services and public employees. These reforms have reduced the human and material resources, weakened the regulatory authority and downsized the public administrative systems in both the developed countries of the Global North and the developing societies of the Global South, while making at best only minor improvements in efficiency, technological innovation ("E Government"), and

cost reductions (Srivastava 2009; Brinkerhoff and Brinkerhoff 2015).

## Globalization, the Rise of China, and the Global South

The economies of the developing countries in the Global South now produce nearly half of the world's economic output measured in terms of Gross World Product (UNGA 2014: 2). In fact, a remarkable shift in the ongoing processes of economic globalization has taken place since the 1990s. This is evidenced by the fact the developing countries share of the Gross Word Product jumped from 23% to 40% between 2000 and 2012. Their share of total world trade also increased from 39% to 52% during this same period (WTO 2014: 60). In fact, the African countries have experienced higher economic growth than the developed countries of the Global North. Their average annual growth rate in terms of real output increased from 2.6% in 1990–2000 to 5.3% in the period 2000–2010. According to the World Bank, seven out of the ten fastest growing economies in the world during this decade were in Africa (Beri 2015). In fact, all regions of the South have experienced significant economic growth and they have done so in spite of the most severe recession in the North since the Great Depression of the 1930s. In addition, since 2009, the developing countries of the South have exported more to each other than to the developed countries, and since 2011, their total trade has risen to over $4 trillion USD (UNGA 2014: 2).

The remarkable growth of China's economy and its increasing trade with and investments in the developing countries have greatly contributed to these unprecedented achievements in economic development in the Global South. In three decades, China reduced its poverty rate from 84% in 1980 to 10% in 2013 and reached upper-middle-income status (Harris 2015; Schellekens 2013). In doing so, the country lifted over half a billion people out of poverty and contributed to the development of other developing countries, directly through bilateral trade and financial flows and indirectly through growth spillovers and terms of trade effects (Schellekens 2013).

These unprecedented economic developments in combination with the rapid spread of electronic communications connectivity across the South point to a new strength and potential for progress in this important part of the world. As a result, the United Nations (UNGA 2014: 2) has predicted that by 2025, the Global South is likely to have some 600 million households with incomes of over $20,000 USD per annum and total annual consumption of $30 trillion USD. By 2020, the economies of the three largest developing countries – China, India, and Brazil – are projected to produce a greater share of the Gross World Product than the six largest developed countries of Canada, France, Germany, Italy, the United Kingdom, and the United States of America combined (UNGA 2014: 2).

Increasing South-South cooperation is directly linked to the growing trade and flows of foreign direct investment between the developing countries, and both of these factors are transforming the world economy. The importance of South-South cooperation should not be underestimated (UNDP 2016). According to the United Nations Office for South-South Cooperation (UNOSSC 2016: 1) South-South Cooperation (SSC) is defined as the "collaboration among countries of the South in the political, economic, social, cultural, environmental and technical domains," and includes sharing "knowledge, skills, expertise and resources to meet their development goals through concerted efforts." While this form of cooperation generally involves two or more developing countries, it also increasingly takes place on a regional and interregional basis.

The past two decades have seen SSC grow rapidly in scale and intensity (UNOSSC 2016: 1). It has encompassed an "increased volume of South-South trade, South-South flows of foreign direct investment, movements towards regional integration, technology transfers, financial and monetary cooperation and in-kind contributions." According to the United Nations Industrial Development Organization (UNIDO 2016) SSC has greatly facilitated "the exchange of knowledge, experience, investment,

information and capacity between and among Southern countries through government, civil society organizations, academic institutions, national institutions and networks to accelerate political, economic, social, cultural, environmental and technical development" (UNIDO 2016). UNIDO also points out that SSC is characterized by the pursuit of "mutual benefit between countries, respect for national sovereignty and ownership, establishment of partnerships among equals, non-conditionality and non-interference in the domestic affairs" of the countries involved (UNIDO 2016).

The traditional North-South pattern of international development assistance, referred to as Official Development Assistance (ODA), is increasingly being displaced by SSC. In the last decade and a half, the Peoples Republic of China has taken the lead in SSC. China's leaders believe that the globalization of trade, finance, and communications has produced a complex and interdependent world economy in which the hegemonic capitalist countries are losing their power to prevent or control the diffusion and redistribution of economic wealth and political power (Harris 2015). As a result, they believe a new multipolar world order is emerging, which is being shaped by China and other large developing countries (such as Brazil, India, and South Africa) with the support of most of the other countries in the Global South (Santander Campos 2013: 1229; see also Zheng and Lim 2017).

The rise of China can be regarded as the most important factor affecting the evolving world order in the twenty-first century (Zheng and Lim 2017). Indeed, a new alternative world order appears to be emerging with the proliferation of regional as well as inter-regional forms of intergovernmental economic and political cooperation in the Global South. These new forms of intergovernmental cooperation include: the inter-regional BRICS coalition (Brazil, Russia, India, China, and South Africa); the regional Union of South American Nations; and the ASEAN–China Free Trade Area (ACFTA), which is a regional free trade association that involves the ten member states of the Association of Southeast Asian Nations (ASEAN) and the Peoples Republic of China. In the Middle East, there is the regional Gulf Cooperation Council, which is comprised of the energy rich Persian Gulf states of Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates. At the inter-regional level there is also the Community of Latin American and Caribbean States (known as CELAC) and the inter-regional cooperation forum that includes the CELAC nations and China (the China-CELAC Forum), as well as the Forum on China-Africa Cooperation (FOCAC). These two inter-regional forums focus on SSC and development issues of mutual concern to China and the developing countries in Africa, Latin America, and the Caribbean. They serve as a venue for planning and financing infrastructure projects; joint commercial ventures; various types of educational, technical, and cultural exchanges; as well as other forms of economic, political, social, and cultural cooperation.

There is also the India–Africa Forum, which is the official platform for African-Indian SSC (Beri 2015). It is focused on cooperation in trade, industry, investments, peace and security, good governance, and information and communication technology. The India-Brazil-South Africa Dialogue Forum (IBSA 2017) is a tripartite group of developing countries that promotes cooperation among their three large developing economies. They represent important poles for galvanizing SSC in the three largest regions of the Global South, namely, Africa, Asia, and Latin America. The IBSA Dialogue Forum has also played an important role in coordinating the foreign policies of India, Brazil, and South Africa with regard to reforming the United Nations, especially the membership of the UN Security Council, in which the Global South is under-represented. While they acknowledge the benefits that their countries have achieved through globalization and freer trade, they have common concerns about the negative effects of globalization on the developing countries and the reprehensible fact that a large part of the world's population has not benefited from globalization. In this regard, they are committed to pursuing negotiations through the UN, the WTO, and other intergovernmental venues to eliminate the protectionist and

trade-distorting practices of the developed countries of the Global North. They seek to create a level playing field for trade between the developing countries of the Global South and the developed countries of the Global North (IBSA 2017).

The proliferation of these new intergovernmental institutions of SSC appears to be changing the evolving governance of globalization and bringing about the transformation of the existing international order. They are subtly chipping away at the foundations of the global hegemony held by the major developed countries of the Global North (Harris 2015). Most of these SSC intergovernmental efforts are anti-neoliberal in orientation and they are based on win-win, South-South cooperation. In their aims and actions they go well beyond the neoliberal trade liberalization efforts that have been led by the transnational corporations and the governments of the USA and the other major developed countries. They seek to build and consolidate strategic economic and political partnerships between the developing countries to advance their mutual development while also contesting the inequitable aspects of the existing world order (ECLAC 2015; Fernandez and Hogenboom 2010; Harris and Arias 2017).

These structures and practices of SSC are increasing the power of the developing countries and their role in governing the world economy. They are also creating the foundations for a new nonhegemonic and multipolar, international order (Santander Campos 2013: 122; Zheng and Lim 2017). China has taken the lead in this effort, and although the socialist ideology of China's leaders profoundly influences their worldview and their political strategies (see Harris 2015), the Chinese government does not draw strict ideological lines in the PRC's economic relations and the assistance China gives to other developing countries. The Chinese government's official position is "various social systems and development models should coexist harmoniously in the world," and as a result in its trade relations and SSC, "China adheres to the principles of not imposing any political conditions, not interfering in the internal affairs of the recipient countries and fully respecting their right to independently choose their own paths and models of development"(Aho 2011; Lu 2014).

In the larger global context, China's increasing economic and political relations with the developing countries in Africa, Asia, Latin America, and the Caribbean and the increasing flow of trade, investments, loans, economic cooperation, and technical assistance between China and these countries has become a new driving force in the contemporary globalization process. As a result, according to a recent UN report, the "phenomenal rise of the South and the surge in South-South cooperation" have begun to transform the globalization process, and this transformation has now become an important subject of contemporary research and analysis, e.g., see the special report on South–South Cooperation prepared by the Secretary General for the 2014 session of the United Nations General Assembly (UNGA 2014: 8). It is also important to note that the "rise of the South" directly challenges the Western ethnocentric biases that underlie most existing ideologies of globalism and the expectations about the future direction of globalization held by most globalists in the developed countries of the Global North.

At the same time, a new wave of nationalistic and anti-globalization politics have gained ground in the Global North, notably in the UK, the USA, and some of the member states of the European Union (Esch et al. 2017). For example, the President of the USA Donald Trump frequently criticized globalism during his presidential campaign in 2016 and stated publicly afterwards that "we will no longer surrender this country and its people to the false song of globalism" (Miller 2017). As a matter of fact, the political elites in the Global North appear to be increasingly divided over globalization, and the rising tide of nationalism and nationalistic political leaders seriously casts doubt on the continued liberalization of international trade and finance. This situation would have seemed inconceivable only a few years ago, but a new era appears to be unfolding in which the political and economic certainties that have held constant for many decades since the end of World War II are seriously being challenged. In fact, top political leaders in the USA and UK no longer appear

to be interested in maintaining many of the features of the liberal world order that the leaders of these countries constructed after 1945 (Esch et al. 2017). This political shift in the West along with the increasing rise of China and the Global South will most likely diminish the momentum and quite possibly change the direction of globalization in the coming decades. It also contradicts the liberal assumptions that underlie Western-centric ideologies of globalism (Miller 2017).

# Globalization and Law

Paul Battersby and Rebekah Farrell
RMIT University, Melbourne, VIC, Australia

## Synonyms

Ethics; Geneva conventions; Governance; Human rights; International crime; International law; Legal futures; Norms; Rules; Transnational law

## Introduction

Statutory laws are products of legislative processes within sovereign nation states and are thus conventionally associated with the state-centered national and international affairs. However, principles encoded into formal multilateral agreements between nations influence the lives of billions of people and in multifarious ways shape global patterns of human interaction. Normative globalization means the spreading acceptance across international boundaries of rules governing all manner of political, social, economic, cultural, and environmental relations, made possible through the ratification of international treaties and the development of complementary national legal codes, but also through customary states' practice. To appreciate the relationship of law to globalization, we first need to recognize the dynamic processes by which such international laws are made, and remade, tested, and subverted by lawful as well as unlawful human agents. Globalization is not uniform, and thus, accordingly, the global landscape of law is marked by irregular patterns or contours of legal formation and declension, with towering summits of compliance matched by deep valleys of deviation from global norms. International law impacts upon administrative practice at all levels of government, and the organizational practices of private commercial and not-for profit actors. However, law is not simply a matter of codification and compliance. Law can also be conceived as a creative space in which social agents play a critical role in shaping global legal futures.

## Law: A Conventional International Perspective

There is no global sovereign power to enforce law in the international system, and there is ample evidence of consistent and extensive transgressions by states behaving contrary to their international legal obligations (Kratochwil 2014; Blakeley and Raphael 2013; Krasner 1999). The International Criminal Court is empowered to impose criminal penalties for war crimes, genocide, and crimes against humanity, but only where the persons charged are either nationals of a state that is party to the *Rome Statute* (Which therefore excludes nationals of the United States, which signed but withdrew intention to ratify in 2002 https://2001-2009.state.gov/r/pa/prs/ps/2002/9968.htm) or have committed a crime within the territorial jurisdiction of the Court. While international humanitarian norms have legal force at the

international level, international human rights norms stand on much shakier ground. The International Court of Justice (ICJ) has authority to determine if and where states have violated their obligations across the broad spectrum of international treaty law, but has no power to impose penalties for noncompliance. With the exception of international criminal law therefore, in order for international norms to be given effect, they must be adopted into national legal codes and enforced through national-level criminal and civil processes, except where regional courts have jurisdiction, such as the European Court of Human Rights. Observance is consequently uneven.

One could be forgiven for succumbing to the notion that the idea of international law as the embodiment of universally agreed principles of justice and right is simply too fantastical. Critics of a conservative and nationalist persuasion argue that humanist legal transnationalism shackles sovereign states and prevents democratically elected governments from implementing their mandate to protect their country from attack (Kyl et al. 2013, p. 125). Liberal transnationalists decry the fact that, for reasons of diplomatic process, representatives from states with poor human rights records can nonetheless serve on international human rights bodies like the UN Human Rights Council (The UN Human Rights Council comprises 47 national representatives elected for 3-year terms by the UN General Assembly which, so the Council claims, weighs "candidate States' contribution to the promotion and protection of human rights…" http://www.ohchr.org/EN/HRBodies/HRC/Pages/Membership.aspx (Accessed June 2, 2016) (Neuer 2016). In the post-development quarter, the so-called international human rights "empire" is denounced as an elite enterprise involving highly paid humanitarian lawyers and celebrity advocates for whom cases of human rights abuse are a cause célèbre (Hopgood 2013, p. 2, 119; Kapoor 2013). Worse still, arguably, the institutions of humanitarian and human rights merely uphold the status quo in a global system of extreme inequality represents an unconscionable denial of economic justice to the billions of people living in the Global South (Escobar 1995; Sklair 2002; Rajagopal 2004; Hardt and Negri 2000, 2005, 2009). International humanitarian and human rights regimes are criticized for undermining security and inhibiting justice, where the protection of fundamental rights becomes the pretext for military intervention (Duffield 2007, 2010).

Notwithstanding these omissions, deficiencies, or gaps, many bodies of international law are routinely effective, where they serve systemically significant ends, to keep money, goods, and people circulating around the world. The task, from a constructivist standpoint, is to realize the possibilities for "resistance" to the moral hegemony of global elites and for "recoding" laws to recognize the broad scope of human need and aspiration (Rajagopal 2004). International laws are made by global elites, but it is entirely possible to appropriate the discourses of liberal norms and use these to empower people to challenge unjust authority or the commercial exploitation of human vulnerability (Wheeler 2010; Falk 1999).

## International Law and Human Rights

In liberal institutionalist models of global justice, the principles that underpin a just international order are inscribed in key public international law instruments. Foundational to this international rule of law is the *United Nations Charter* (1945), binding on all United Nations member states, which institutes a collective commitment

- To reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations large and small.
- To establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be maintained.
- To promote social progress and better standards of life in larger freedom.

The *Universal Declaration on Human Rights* (1948) is the fundamental legal document underpinning the post-1945 human rights regime. Unlike the UN Charter, which binds member

states to act in accordance with its principles, the Declaration is nonbinding in that it does not incur any formal legal obligations, even though all UN members are automatically party to it. However, it sets out minimum expectations for the recognition of fundamental rights defined positively as freedom of speech, association, religion, and movement, and negatively as the freedom from political oppression, from exploitation, and from discrimination. The document establishes equality of rights as a benchmark, from the equal right to a fair trial; to the right to a reasonable standard of living; to education and health care irrespective of social class, ethnicity, language, or religion; and to engage in representative politics. Two covenants spell out what are categorized as first-generation and second-generation rights. The *International Covenant on Civil and Political Rights* (ICCPR) articulates the rights of individuals to, inter alia, freedom of speech and of trial by jury and freedom from torture – termed first-generation rights because their recognition is seen as essential for the enjoyment of all other rights. The *International Covenant on Economic, Social and Cultural Rights* (ICESCR) sets forth second-generation rights, including the right to fair wages, the right to work, and the right to food and shelter, enjoyed free of any discrimination based on gender, ethnicity, or religion. Indeed, there has been a significant enumeration of human rights since the Declaration came into force addressing the rights of refugees, the rights of the child, labor rights, women's rights, and the rights of peoples with disabilities (Clapham 2007).

What are called third-generation rights, the rights of peoples, emerged in recognition of the special collective rights of minorities and indigenous peoples. The principal instruments asserting this category of rights are the *African Charter on Human and Peoples' Rights* (1981), the *International Labour Organization Indigenous and Tribal Peoples Convention* (1989), and the *Declaration on the Rights of Indigenous Peoples* (2007). Indigenous rights also come within the purview of conventions addressing biological diversity and intellectual property. While genetic research delivers indisputable human health gains, biotechnologies have given food and drug companies the means to distil and manipulate the genetic structure of plants known to people in traditional communities for their medicinal qualities. This "traditional" knowledge, incorporating "cultural expressions and genetic resources" is an integral part of an emerging indigenous rights regime, but while the principle appears uncontroversial, its codification requires that distinctions be made between what is traditional and natural and what is adapted or created through the application of scientific and technical know-how (The World Intellectual Property Organization (WIPO) has prioritized the development of specific protections for traditional knowledge in intellectual property rights law. See, http://www.wipo.int/tk/en/igc/ (Accessed June 9, 2016). For draft principles on intellectual property and genetic resources see, Intergovernmental Committee on Intellectual Property and Genetic Resources, Traditional Knowledge and Folklore (2016) "Consolidated Document relating to Intellectual Property and Genetic Resources." 30th Session, Geneva May 30–June 3, WIPO/GRTKF/IC/30/4.).

Implementation of international human rights laws is contingent upon recognition of treaty obligations by states but also the capacity of national and local level institutions to adopt human rights into practice. The United Nations Human Rights Based Approach to Development Cooperation (HRBA) makes explicit the need to absorb knowledge of international human rights law (IHRL) across the UN system, at all levels of operation, and, through this, transfer human rights norms at multiple points of contact within national governments and social institutions (UNDG 2003). Institutional processes can, in this way, encourage the globalization of international norms by transforming routine or "mundane" organizational behaviors, and by encouraging greater individual awareness and regard for rights norms.

International law is a dynamic space, where laws are evolving through the interactions of many social and political actors. The identification and elevation of women's rights exemplifies this dynamism. In the Universal Declaration, the right to the presumption of innocence and a fair trial accords those charged the right to all legal means "necessary for *his* [emphasis added]

defence" (Article 11.1). Both the ICCPR and the ICESCR use gendered language to confer rights specifically upon men. For example, Part 3, Article 6.1 of the ICCPR expressly states that "no one shall be arbitrarily deprived of *his* life [emphasis added]" (1976). The ICESCR, while striving to be balanced nonetheless also specifically asserts the rights of men with regard to trades union membership (Part 3, Art. 8.1a) and living standards (Part 3, Art.11.1), echoing a time when men predominated in industrial workforces and were the principal breadwinners in the family home (1976). Feminist writers charge that human rights laws, while claiming to accord equal rights to all irrespective of gender, religion, ethnicity, or social class, fail to accommodate the reality that each influence how rights are enjoyed in practice. Foundational international human rights laws are silent on the informal and deliberate exclusion and victimization of women, for which reason the *Convention for the Elimination of all forms of Discrimination Against Women* (CEDAW) was brought into being (Brems 2003, p. 103). But even then, rights accorded to women in this document are not hailed as universal. Currents of national politics inevitably affect the extent to which rights are enjoyed, and by whom.

## International Humanitarian Law

How much harder is it to guarantee rights observances in armed conflict? One famous anti-war quote, from the American writer Ernest Hemmingway reads, "But never think that war, no matter how necessary, nor how justified, is not a crime" (1946, p. xv). Still, Hemmingway conceded that "to win a war you have to do things that are inconceivable in peace" (1946, p. xv). And yet bodies of law have emerged that seek to control the excesses of war, while falling short of outlawing war altogether. Whatever our views on the justifications for and the nature of armed conflict, war is a law-governed pursuit and military necessity is the caveat that permits the "inconceivable" to be conceived.

International humanitarian law (IHL), or the laws of war, is primarily concerned with conduct during and immediately after armed conflict (*in bello* and *postbellum*). The Geneva Conventions emerged out of a sense of common humanity and moral revulsion at the increasingly visible inhumanity of war. The first Convention (1864) established that the International Committee of the Red Cross (ICRC) should be granted access to war zones, where ICRC staff could provide medical aid to wounded soldiers on all sides – in effect codifying the principle of neutrality to the benefit of future generations of humanitarian workers – provided of course that neutrality can be established (Hilhorst and Pereboom 2016). Three more followed: the second codified protections (in effect rights) for shipwrecked and wounded sailors; a third established the rights of prisoners of war; and the fourth, in 1949, conferred specific protections on civilians in or near to combat zones. Central to the Geneva Conventions is the concept of protected persons being civilians or those with noncombatant status, who present no immediate military threat and are, therefore, not to be subjected to violence or inhumane treatment, and are entitled to safe passage or medical assistance or both within and beyond the field of battle. This requirement forms the substance of Common Article Three (so named because it is common to all four treaties). Two further protocols were included in the Conventions in 1977 to strengthen civilian and noncombatant rights, with the Second Additional Protocol refining and extending the scope of protection in noninternational armed conflicts (Cullen 2010).

The scope of humanitarian protection has increased markedly over the past century, creating global obligations to care of the wounded and the displaced in all forms of human conflict. The Geneva Conventions are binding on states parties but enforcement depends upon the willingness of states to recognize their obligations in practice and through their national justice systems. That said, Article Three is regarded as a peremptory norm which applies, in theory, to all states irrespective of whether they are signatories or not (Kolb 2015) (The *Vienna Convention on the Law of Treaties* (1969) defines peremptory norm as "a norm accepted and recognized by the international

community of States as a whole as a norm from which no legal derogation is permitted" (Article 53, UNTS, 1980, p. 344.). The Conventions also apply to nonstate armed actors which, where meeting the criteria for a combat force, are recognized as legitimate and whose armed combatants are entitled to the same observances offered to state armed forces personnel. In addition to conferring certain privileges on all those caught in the horror of war, the Conventions imply a general responsibility to not act contrary to their intent.

## International Criminal Law

In contrast to violations of nonbinding international laws, international crimes incur criminal penalties, meaning that persons found guilty of war crimes, crimes against humanity, and genocide, (The definitions of these crimes are lengthy but essentially in the Rome Statute the crime of genocide is the deliberate destruction "in whole or in part, a national, ethnical, racial or religious group" (Article 6); crimes against humanity include "murder," "extermination," "enslavement," "torture," and "rape" (Article 7); and war crimes are "grave breaches of the Geneva Conventions" (Article 8.2a).) as set down in the *Rome Statute of the International Criminal Court* (2002), face a custodial sentence commensurate with the harm or harms inflicted. These are crimes that, as the Preamble to the Statute claims, "threaten the peace, security and well-being of the world" (2002, p. 7). Besides the usual technicalities of sovereignty and jurisdiction, the effectiveness of the ICC and international criminal tribunals is limited by legal interpretation. Convictions for international criminal acts are rare but attention-grabbing cause célèbre, like the trial of former Bosnian President Radovan Karadzic, sentenced to 40 years in prison for complicity in the 1995 Srebrenica genocide (Borger and Bowcott 2016; Kendall 2015). The bar for proof of criminal complicity is set very high at international criminal tribunals, rightly so given the serious implications for those convicted. But this, and the ambiguities of the *Rome Statute*, leaves room for significant divergences of judicial opinion, and consequently significant obstacles to successful prosecution (Webb 2013) (Two such tribunals were established in the 1990s to try persons for genocide in the Balkans wars of 1992–1995, and the "Rwandan massacre" of 1994.). The ICC's defenders stress the demonstration effect of international criminal cases. The Court's existence "sends a message" that the perpetrators of international crimes will eventually be brought to justice. Political opposition to the ICC is gaining traction, however, with some African nations contemplating withdrawal for an alleged anti-Africa bias in Court proceedings (Monageng 2014; Robertson 2002).

## Transnational Criminal Law

Crime has become a globalized and globalizing phenomenon. Hence, transnational criminal law is growing in international significance, supported by the entry into force of key crime conventions, the *UN Convention Against Corruption* (2004), and the *UN Convention Against Transnational Organized Crime* (CTOC) (2004). The first strengthens the liberal norms governing international trade and investment relations by seeking to curb the influence of bribery and patronage in global business dealings. The second is recognition by states that they have a common security interest in cooperating to address the growth of transnational organized crime, inter alia, all forms of trafficking and smuggling, money laundering, embezzlement, fraud, and official corruption, which have a corrosive effect on governance and law enforcement. The CTOC's significance is amplified by international concern for the causes and the effects of globalized terrorism (Rice 2012). But while the CTOC furthers the hegemonic discourse of transnational organized crime as a convergent global security threat, it establishes international norms that can also potentially, and perversely, complement the pursuit of global justice.

Corruption undermines international development programs, skews wealth distribution, and weakens governance institutions. Victims of crime are entitled to protection and rehabilitation.

The duty to protect civilian populations extends to the reduction of gun violence and other firearms offences in peacetime, which can be achieved by restricting the global trade in weapons through more effective policing. Annexed to the CTOC are protocols, which encourage states parties to act in ways consistent with these priorities. For example, the Trafficking in Persons Protocol advises states to "*consider* [emphasis added] the physical, psychological and social recovery of victims," which, though falling short of requiring fair and just treatment imply an entitlement or right to specific protections (UNODC 2004, p. 43). The Trafficking in Firearms Protocol complements the *Arms Trade Treaty* (2014) in, among other things, calling for legislative and law enforcement steps to reduce the illicit manufacture and sale of "any portable barreled weapon" (UNODC 2004, p. 72). Admittedly, these norms are not couched in categorical language, leaving much latitude for states to determine how far they will comply, but they at the very least provide a basis for strengthening global justice claims.

## The Transnational Space of Laws

The preceding sections set out some of the basic premises and issues raised by the evolution of international law over the twentieth century. Thinking more holistically about law, as both codified norms and socially embedded practice, we can imagine that law does not "function" in a neutral space but rather exists in creative tension with the complex environments in which it evolves. Law is part of a larger social system, or social ecology (Luhmann 2008, 2013), the largest of which the planetary or global social system that all of humankind inhabits. Documented or codified laws are formed through a process of argument, judgment, and interaction between a range of influencers and not merely through acts of judicial decision making. Law is arguably an evolutionary process in which nonlawyers and laypersons play an important role in fashioning norms, although not always with palatable consequences (Kennedy 2004; Alverez 2005, pp. 611–616). So, we can approach global justice aims by first positing fields or spaces where laws intersect. At a very rudimentary level for example, a person's right to basic healthcare is affected by the degree to which international and transnational crimes are policed and minimized, the extent to which gender rights are valued and respected, and freedom of religion and other civil and political rights upheld.

Thinking divergently, and adopting an evolutionary and eclectic approach to law, development practitioners can discover fresh avenues for redress and new means to protect the vulnerable against abuses of power and privilege. This requires a basic grasp of the complementarities between bodies of international law, the capacity to connect law with practice, and a willingness to step outside legal convention.

## International Trade and Investment Law

International trade and investment treaties complement the pursuit of humanitarian and other normative ends, which we might for convenience refer to a sustainable development. The 162 states party to the Marrakesh Agreement (1994), the founding document for the World Trade Organization (WTO), agree, in principle, to make "optimal use of the world's resources in accordance with the objective of sustainable development, seeking both to protect and preserve the environment and to enhance the means for doing so in a manner consistent with their respective needs and concerns at different levels of economic development" (WTO 1994). While the language used does not impose binding obligations on WTO members, the Agreement implies an obligation to work in good faith towards the accommodation of sustainable development principles in the practices of international trade and investment. International treaties like the *Convention on the Illegal Trade in Endangered Species* (CITES) for example and national custom and environmental laws prohibiting importation of illegally sourced forest and marine resources demonstrate states' interest in both preventing environmental destruction and further constraining the scope for transnational organized crime. Even though countries

dependent upon timer and fisheries exports are concerned that the levels of documentation necessary to satisfy legal requirements stretch the limits of their regulatory and law enforcement capacities, such prohibitions do not constitute restraint of trade under WTO rules (Battersby 2014). Though we might expect all humanitarian, human rights, and sustainability norms to run second to state and private commercial priorities, these are not incompatible ends (Desierto 2015; Vadi 2010).

## Extraterritoriality

The responsibility to act in compliance with international treaty obligations is borne by juristic persons, individual and corporate, residing or registered in signatory states (Noortmann 2015; Wouters and Chané 2015). Extraterritorial provisions within national laws open opportunities for individuals and organizations to be called to account for their actions overseas where these transgress to treaty obligations of their state of residence, or business operation. One of the most well-known sources of extraterritorial authority, the US Alien Torts Statute (ATS) acknowledges US district courts' jurisdiction to hear cases on criminal matters concerning acts "committed within their respective districts, or upon the high seas" and to grant "alien" persons the right to pursue a civil law suit for "violation of the law of nations or a treaty of the United States" (*Annals of Congress* 1789, pp. 2242–2243; USC Title 28, Pt. IV, Ch. 85, 1350). There have been many such torts cases brought before US district courts since the 1990s as lawyer activists representing alleged victims of US-registered TNCs began testing the limits of the ATS (For example, *Wiwa v. Shell* (Ogoniland, Nigeria); *Sarai v. Rio Tinto PLC* (Bougainville, Papua New Guinea); *Doe v. Unocal* (Myanmar). Extensive details, documents, and commentaries, on ATS and other legal proceedings against corporate entities can be found at http://business-humanrights.org/en (Accessed June 3, 2016). While the tide of judicial opinion has shifted against an expansive interpretation of the scope of this statute, there is still ample opportunity for US-linked corporations to be held accountable for transgressions of international and national law in the US justice system.

On the question of knowing involvement in the crimes of corruption and fraud, the US *Foreign Corrupt Practices Act* (1977) invites the broadest possible interpretation, and the widest extraterritorial application. Here US criminal and civil law converge, and from which convergence, criminal penalties can arise, where a company's directors fail to keep detailed records of their financial dealings at home or overseas and where there is strong circumstantial evidence to presume guilt (15 USC 2B, 78mb 2–5). Litigation risk is heightened in the post-9/11 era where laws to control transnational crime and compel corporate entities to comply with anti-terror legislation in the USA and many other western countries have been used to punish international corporate unlawfulness (U.S. Congress. Senate 2012; U.S. Congress, HOR 2001; Battersby 2014).

## "Soft Law"

"Soft law" here encompasses the codes of conduct internal to transnational organizations which constitute yet further evidence of nonstate actor efforts to promote compliance with international laws (for example, Rio Tinto 2015). The specter of civil and criminal litigation is one reason for the increased attention given to human rights and humanitarian obligations by private companies (UKJCHR 2010). Leading the drive to encourage greater corporate respect for noncommercial norms, the *OECD Guidelines for Multinational Companies*, first issued in the 1970s, sets out a template for prudential transnational corporate governance which incorporates strong recommendations to uphold international sustainability and human rights principles (OECD 2008). The OECD's Investment Committee furnishes the global corporate sector with "risk awareness" tools for operations in "weak governance zones," which it defines as states in which the government "cannot or will not" govern according to their sovereign obligations, implicating many of the conflict-afflicted countries from which the world

derives much of its mineral resources (OECD 2006, p. 11). There are of course no serious penalties for noncompliance, and many major transnational corporations continue to operate very close to the edge of their legal and ethical responsibilities. Still, these statements of principle can be construed into a larger view of international customary practice, to which appeals can be made, and obligations attributed, in efforts to challenge the abuse of power and privilege.

## Case Study

### Unethical Offshore Clinical Trials

The development of new treatments for major diseases is undoubtedly a global human health good, but the means by which drugs are sometimes tested in faraway places violate fundamental human rights and conflict with established legal standards governing the use of human subjects in scientific research. Historically, clinical trials were activities undertaken by state governments upon citizens within their own borders. The most well-known examples of state-led unethical clinical trials are those undertaken in Nazi Germany and Tuskegee, USA. These cases and the codes of conduct that arose from them provide the modern day touchstone for ethical standards (Pressel 2003; White 2003). The world pharmaceutical industry has grown rapidly since the 1950s, with a current net worth of $300 billion per year (World Health Organization 2015). Choudhury (2005) considers this growth phenomenon to be largely a result of the pharmaceutical industry's ability to take advantage of the creation of the increasingly liberalized global market along with innovations in transport and communication so readily associated with the globalization process. Consequently, "Big Pharma" assumed a primary role in drug research and development (Choudhury 2005, p. 43). Gatter (2006, p. 352) notes that regions such as Latin America, East Asia, and Africa have become targets for offshore clinical trials, where North American, Japanese, and European pharmaceutical companies can take advantage of substantially decreased costs (DuBois 2003); lack of regulation (Gatter 2006) and access to a larger pool of human subjects (DuBois 2003) in a bid to generate favorable trial results.

The practice of conducting clinical trials in developing countries is not a new phenomenon. The clinical trials of radioactive drugs on Alaskan villagers is an example of the US government sourcing clinical trial subjects from an offshore location. A second, better-known example is the US conducted drug trials on Guatemalan citizens, which saw subjects deliberately infected with sexually transmitted diseases (Aljazeera America 2015). What is new, however, is the extent of this offshore practice. This is particularly so in the case of US pharmaceutical companies, following the relaxing of US laws in 1994 to legitimize foreign testing (Dubois 2003). Since 1990, the conducting of clinical trials in foreign countries has increased over 2000% (Schuster 2015). While the exact extent of the offshore movement remains unknown, a report conducted by the Inspector General of the Department of Health and Human Services, Daniel Levinson, titled *Challenges to FDA's Ability to Monitor and Inspect Foreign Clinical Trials* found that at least 80% of the drugs approved for sale in the US market had been trialed either wholly or at least in part, in a foreign country (Levinson 2010).

Ethical issues in clinical trials arise from questions of: informed consent, lack of independent oversight, and failure to respond to a patient's adverse reactions. Due to the cloaked nature of the clinical testing processes in developing countries, it is difficult to determine to what ethical standard these activities are being conducted. However, the well- documented activities of Pfizer in conducting medical experimentation in Kano, Nigeria, and the resulting litigation from these events (*Abdullahi v Pfizer, Inc., 562 F 3d 163 2d Cir.* (2009) provide insight into the type of unethical practices that are being carried out. In 1996, pharmaceutical corporation, Pfizer, hearing of an outbreak of meningitis in a small town of Nigeria, took the opportunity to test their drug Toxacin (also known as Trovan) on young children infected with the illness (Patterson 2010). At this time, Trovan was prohibited from being tested in the United States, having presented serious side effects including liver damage and a degenerative

bone condition (Patterson 2010). It is alleged that Pfizer was aware of the status of Trovan at the time but despite this recruited and tested the experimental drug on 200 Nigerian children. After conducting the trial for a period of 2 weeks, Pfizer left the site without any follow-up treatment (Patterson 2010). It has been reported that 11 children lost their lives as a consequence of the trials and a significant percentage of the 200 were left severely debilitated (Patterson 2010).

### Obstructions to Universal Accountability

During the Trovan trial, there were numerous ways in which "Pfizer researchers departed from research practices understood to be customary within the pharmaceutical industry" (Bahir 2006, p. 160). Customary practices can generally be found in "soft law," the formative sources of regulation that seek to control the conducting of clinical trials. The most notable of these include: *The Nuremberg Code* (1946), the *World Medical Association Declaration of Helsinki: Ethical Principles for Research Involving Human Subjects* (1964), and the *World Health Organization, Guidelines for Good Clinical Practice for Trials on Pharmaceutical Products* (1995).

Soft law offers little protection against human rights abuse by pharmaceutical companies (Macklem 2005, p. 285). Bahir (2006, p. 169) attributes this namely to the voluntary nature of the guidelines, which do not "compel companies to abide by the rules," imposing only a moral obligation to do so. Similarly, victims of unethical clinical trials can find little recourse in the context of international criminal law. While the ICC prosecutes the most serious abuses of human rights: crime of genocide, war crimes, and crimes against humanity, it is unlikely that unethical clinical trials would fall within these definitions, unless, according to Schipper (2009), their participants were coerced to take part in them by force. Further, the ICC does not have jurisdiction over legal persons, such as pharmaceutical companies.

Departure from these regulatory guidelines may, however, result in a violation of international human rights law, which, unlike soft law, does carry legal force and unlike international criminal law does have subject matter jurisdiction. There are various human rights standards pertaining to medical experimentation. The most prominent of these being: the Right to Freedom from Cruel, Inhuman and Degrading Treatment, the Right to Bodily Integrity, and the Right to the Highest Attainable Standard of Health. These rights are reflected within various international legal instruments including the UDHR, ICCPR, ICESCR, *The African Charter on Human and Peoples' Rights*, *The European Convention on Human Rights* (ECHR), and *The Convention on the Rights of the Child*.

However, the international human rights law framework, as it currently stands, lacks the ability to hold nonstate actors (such as pharmaceutical companies) directly accountable (Salazar 2004, p. 115). Thus, as argued, in order for international human rights law to be given effect, they must be adopted into national legal codes and enforced through national-level criminal and civil processes. The host state (this being the state, which "hosts" the activities of pharmaceutical companies) holds actual physical and immediate jurisdictional powers over the pharmaceutical company operating within its own borders. However, host states in enacting and enforcing laws that bind powerful nonstate actors, like global pharmaceutical companies, face significant challenges. The relationship between pharmaceutical MNCs and developing country governments is extremely complex. The fact that "a global pharmaceutical company can provide (strong) services to a (weak) state's people" (Lyons 2007, p. 8) by injecting health care delivery systems with necessary capital and providing what would otherwise be unaffordable drugs and services is something that cannot be ignored. It might be argued that developing countries should not be held hostage to the competitive interests of global pharmaceutical companies in serving the financial interests of their shareholders. Yet at the same time, movements towards the regulation of pharmaceutical companies' activities in developing countries should not forgo the necessary health care benefits that they provide nor should it exclude the developing world from important medical advances.

Home states (those being the states where the pharmaceutical company headquarters or holding

company is registered) have arguably minimal control over the offshore activities of pharmaceutical companies as evidenced by the lack of oversight of offshore trials. Dubois' work considers the inefficiencies of home state regulation in protecting the rights of offshore participants, and he uses the shortcomings of United States regulatory systems to illustrate this lack of oversight issue. The USA, upon permitting foreign testing, failed to supplement this with adequate safeguards for regulation and control and therefore ensure the wellbeing of subjects abroad as well as consumers within its own borders (Dubois 2003). Further, there is presently no regularly invoked legal framework that has a demonstrated capacity to hold pharmaceutical companies to account for their activities offshore. The ensuing litigation from the activities of Pfizer in Nigeria was brought as an Alien Torts Statute (ATS) action in the New York District Court. This was a landmark decision that expanded the jurisdiction of the ATS by holding that "the prohibition in customary international law against non-consensual human medical experimentation can be enforced through the ATS" (Abdullahi v. Pfizer, Inc., 562 F 3d 163 2d Cir. (2009)). While the ruling in *Abdullahi v Pfizer* was considered a remarkable achievement in the context of pharmaceutical corporate accountability, the hopes for future cases of this kind were short lived. The subsequent decision of *Kiobel v Royal Dutch Petroleum* (621 F 3d, 111 2d Cir. (2010)) appears to have significantly curtailed the operation of the ATS by holding that corporations do not fall within its jurisdiction.

## Transnational Legal Futures

Despite the obstructions to universal accountability for unethical offshore clinical trials as set out in the preceding paragraphs, optimism remains for curbing the unethical practices of pharmaceutical companies and achieving justice for their victims. The development of a transnational space of laws presents opportunities to clinical trial participants and, more broadly, to those who suffer human rights abuses at the hands of multinational corporations.

One of the more significant aspects to the evolution of this transnational space of laws is the development of transnational tort law made possible through the extended extraterritorial reach of domestic civil laws. This development is evidenced through the rise of transnational tort litigation, with advocacy organizations and tort lawyers experimenting with the jurisdictional boundaries of common tort law in an effort to attribute accountability to MNCs operating in developing countries. Since the decision in Kiobel, new cases are being brought before US district courts in an attempt to reinstate the broad scope of the ATS' jurisdiction. Progressive movements also appear in transnational tort law in European jurisdictions. The recent Dutch case of *Friday Alfred Akpan v Royal Dutch Shell* C/09/337050/HA ZA 09–1580 (2013) in finding that Dutch Royal Petroleum can be held accountable for human rights violations offshore may set a precedent for transnational tort litigation. In the UK context, plaintiffs seeking compensation for injuries sustained in South Africa and inflicted by the Anglo-American mining company have brought class actions against these companies in the South African High Court and through the use of transnational tort litigation in the UK High Court (*Vava & Ors v Anglo American South Africa Ltd*., Claim No HQ11X03245).

A second relevant development in the transnational legal space relevant to human rights abuses by pharmaceutical companies is the increase of bilateral and multilateral agreements. A pertinent example of bilateral agreements includes the 1993 *Agreement between the Government of Australia and the Government of Hong Kong for the Promotion and Protection of Investments (Hong Kong Agreement)*. This agreement has currently come into the public spotlight with the tobacco company, Phillip Morris' unsuccessful claim that the Australian Government's enactment of the *Tobacco Plain Packaging Act* 2011 (Cth) is in breach of its obligations under the agreement. Investor-state arbitration is on the rise by means of bilateral treaties, and there are concerns that disputes could increase further with the advent of new multilateral trade and investment agreements. The most recent of these is the controversial Trans-Pacific Partnership Agreement (TPP). The TPP contemplates a legal framework wherein

a foreign company headquartered in one of the 11 signatory states can seek compensation for loss of profit from the government of another of the 11 signatory states should that government enact legislation that will impact the company's future profit margins. While these examples of bilateral and multilateral agreements may not at this point bode well for the protection of human rights, they demonstrate how the space of international laws is constantly changing and the willingness of both states and nonstate actors to be held to account beyond nation-state borders.

However, the expensive, time consuming and uncertain nature of litigation demonstrates why the development of the transnational space of laws must go beyond the work of lawyers inside court rooms. In the context of unethical offshore clinical trials, important contributions are being made by academics, journalists, development workers, medical practitioners, and advocacy organizations. Investigative research is of critical importance in shedding light on the extent to which offshore clinical trials are being conducted unethically in developing countries. Journalist, Sonia Shah's (2006) preeminent work, *The Body Hunters: Testing Drugs on The World's Poorest Patients*, documents "how the multinational pharmaceutical industry, in its quest to develop lucrative new drugs, has begun quietly exporting its clinical research business to the developing world. . ." Dutch NGOs, *Wemos*, and the *Centre for Research on Multi-National Corporations* (SOMO) have undertaken a number of investigative reports on unethical clinical trials in developing countries (SOMO publications include: *Examples of Unethical Trials* (2008), Wemos publications include: *The Clinical Trials Industry in Kenya: Realities, Risks and Challenges* (2014); *The Clinical Trials Industry in South Africa: Ethics, Rules and Realities* (2013); *The Globalization of Clinical Trials: Testimonies from Human Subjects* (2010); and *Examples of Unethical Trials* (2008).). Further, the 2011 *Report on Non-Consensual Medical Research in Africa* published by the Rebecca Project details case studies of unethical clinical trials in Africa. These advocacy organizations further lobby their respective government bodies to seek better regulation and accountability. Wemos advocates for improved supervision at the European level to prevent unethically tested medicines to be marketed in Europe. SOMO's Schipper (2009) in her report for the European Parliament on *Clinical Trials in Developing Countries; How to Protect People against Unethical Practices?* makes a series of recommendations, all of which are within the realm of the European Union's regulatory powers and include investigations, marketing authorization processes, clinical trial databases, and penalties awarded against pharmaceutical companies. Similarly, The Rebecca Project, a US-based organization, proposes recommendations that involve lobbying US congress to direct the FDA to impose a stronger monitoring scheme, impose sanctions on countries and on individual practitioners, and hold congressional hearings. Schuster (2015) in her recent article *For the Love of Drugs: Another Way to Make Profit Off the Poor* proposes that a more significant role be played by the FDA by means of increased mandatory reporting with a public register and increased inspections in developing countries.

## Conclusion

The argument presented in this chapter is that despite the many – valid – criticisms of the international legal establishment, the scope to pursue global justice through law is not exhausted or futile. Knowledge of international law can be a means to raise public awareness of rights and of injustices, and enable lay persons to conceive different legal pathways towards the realization of development and humanitarian ends. Thinking of international law as a creative space where there is scope for imagination and legal or regulatory innovation can generate incentives for development practitioners to engage with legal issues and work in closer cooperation with legal experts. The relationship between international law to development stretches far beyond war crimes trials in The Hague, or the human rights agendas of Amnesty International or Human Rights Watch, or indeed the UN's Human Rights Based Approach. This relationship encompasses routine

legal investigation, monitoring, and advocacy, the discovery of new regulatory possibilities in existing international treaties governing trade and investment. While this approach might be rejected as merely toying with a system that is fundamentally flawed because it is loaded in favor of states and transnational commercial interests, at the very least it opens fresh avenues to expose, challenge, and to restrain the exercise of arbitrary power.

## Globalization and Migration

Val Colic-Peisker

### Synonyms

Global mobility; Human mobility

### Introduction

Migration, in a meaning of transnational human mobility, is an important aspect of globalization (Castles et al. 2013). In recent decades, globalization is usually taken to mean the "latest wave" of globalization rather than a *longue durée* process spanning centuries. In the former meaning, globalization is defined as the acceleration of global economic, political, cultural, and environmental interconnectedness and interdependency over the past several decades, with different authors placing different starting times to it. In any case, globalization became an unavoidable buzzword in social sciences during the 1980s, and in the 1990s, it entered the public vocabulary, at least in the West (Steger 2009). While the process of globalization is not limited to the global expansion of Western capitalism, it is primarily driven by capital's inherent expansionism into new investment markets and new sources of cheap labor (Wallerstein 1979).

Starting from the 1980s, information and communication technology (ICT), epitomized in increasingly widespread use of computers and the Internet, has represented the technological basis for the most recent globalization growth spurt. We can call it thus because globalization is not something that only happened at the end of the twentieth century; it has been happening since the "age of discovery" and the dawn of capitalist modernity in the fifteenth and sixteenth centuries. More recently, the invention of the telegraph in the early 1830s and its widespread use in Europe and the USA by the mid-nineteenth century, followed by the telephone and railways, were every bit as revolutionary in connecting the globe and "making it smaller" as the ICT is today (Hobsbawm 1975/1996).

Even though globalization is not new, it is now more radical than ever before, as a process and as an ideology. Increasingly remote parts of the world's "periphery" join the intricate and intense global net of interconnectedness and interdependency not only through globalization but also as a consequence of migration. In fact, nowadays it is impossible to find a corner of the globe fully inhabited by people unaffected by the desire to venture into foreign lands in the search of security, economic opportunity, knowledge, or adventure. More people than ever before are on the move, at least in absolute numbers, and transnational migration and mobility more generally are diversifying into a multitude of forms, including settlers, temporary migrants, international students, seasonal workers, professional transients, asylum seekers, and tourists (Castles et al. 2013).

In recent decades, global migration has diversified. Until relatively recently, global migration comprised a large majority of settlers that typically moved from rural to urban areas. For over two centuries, low-skilled rural labor moved to growing industrial cities. While various other types of migration also existed, their proportion in the total migratory flows was small. While rural-urban migration may still predominate, especially if we count massive internal migrations within the most populous countries such as India and China, other types of migration are now counted in millions and have global economic, social, and cultural significance. For example, global education mobility and the global

education "market" have boomed over the past decades, benefiting primarily English-speaking countries due to English being the global lingua franca.

Yet, migration remains the most restricted aspect of globalization (Castles et al. 2013). In the words of the Australian Productivity Commission (2016: 21): "The movement of people across borders is distinct from the movement of goods and services given the broader economic and social flow-on effects associated with the former." Goods and capital travel freely across national borders – in recent decades, "free trade" has become a mantra for the governments of "core countries" (it remains to be seen whether the Trump presidency will actually change this), while unrestricted flows of capital through the main global stock exchanges and associated "financial markets" control the global economy. The flows of people, however, are much more controversial and at the time of writing (March 2017), migration is one of the most hotly debated political topics in the "First World."

Instead of "free flows of people," the mantra of the core countries seems to be "border control." The irregular, uncontrolled, and perhaps uncontrollable, flows of people have caused considerable anxieties to the citizens of the "core countries." In the words of Eric Hobsbawm (1999: 166–7), the latter, living in "[. . .] comfortable, protected and self-absorbed enclaves" seem determined to maintain their advantages and privileges vis-à-vis the "uncomfortable and unprotected larger world inhabited by the majority of humans." Of course, migration restrictions and increasing efforts to control transborder flows of people are never presented as unwillingness of the "First World" to share its privileges with the "Third World." Usually, the national security and concerns about terrorism are invoked (Kerwin 2016). It has been relatively easy to incite popular fear and anxiety and consequently gain support for the enforcement of the "sovereign right" of nation-states to control their borders, especially in the USA, Western Europe, and Australia.

There have been attempts to negotiate supranational approaches to migration and migration controls. Apart from managing permanent resettlement of a certain number of refugees through the UN High Commissioner for Refugees (UNHCR), such attempts have not succeeded. Not even the EU, with its well-developed supranational institutional framework and the formally controlled external "Schengen border," has been able to devise and enforce a unified approach to irregular immigration. The irregular migration has been reaching Europe from the south and the east, mainly by boats across the Mediterranean from Africa, and since 2015 also by land via Turkey, Greece, and the Balkans, with the largest recent wave of refugees comprising mainly Syrians escaping the protracted civil war.

In general, today's "managed migration" policy agenda encounters many obstacles. The International Organization for Migration (IOM) (founded in 1951 under a different name and formally incorporated into the UN system in 2016) is a forum for setting standards, hosting negotiations, collecting migration data, monitoring national policies, and helping create the international institutional migration management framework (Goldin et al. 2011). However, there is no regional, let alone global migration policy. National migration policies remain subordinate to exclusive national interests, as perceived and/or engineered by respective national governments at any given time. Therefore, irregular migration remains one of the many global problems without a global solution.

## Migration and the Nation-State in the Global Era

In spite of formidable technological means of surveillance and control, controlling the borders is a difficult task. Enforcing the "fortress Europe" (the fortress "European Union within its Schengen borders," to be precise) against migrant and refugee influx from Africa and Asia or stopping illegal migration from Mexico and Central American countries to the USA by building fences has been presented as increasingly urgent by politicians. Yet, stopping the undesirable migrant flows remains eminently unsuccessful. The exponential rise of irregular migration flows into Europe from the Middle East and Africa that

started in the autumn of 2015 (Kingsley 2015) could not be stopped without deploying the full-blown repressive apparatus of physical violence, which fortunately remain a frontier not yet crossed in the battle for "sovereign borders."

Controlling Australian borders has proven to be somewhat easier, due not only to the geographical isolation of Australia and the fully maritime border of the country-continent but also the readiness of the affluent country to spend inordinate sums on the maritime operation titled "Sovereign Borders" that started in 2013. Australia is also able to finance the "Pacific solution" to the "asylum seekers' problem," which mandates that they can never enter Australia but are instead transported to neighboring Pacific island countries (Nauru and Papua New Guinea) for processing of their asylum claims. The Australian way of countering the "unauthorized arrivals" by physically "turning back the boats" into Indonesian territorial waters is so far the most draconian method of controlling transnational migration into a "First World" country. Because of its success in reducing the asylum seeker arrivals, Australia is currently cited as an inspiration by some European and American politicians, adamant about restricting immigration and, especially, the irregular intakes.

The global system of nation-states with border controls, passports and visas allowing entry and restricting length of sojourn and rights of entrants, is ubiquitous and taken for granted at the present time. However, the guarded "sovereign" borders and state controls of immigration are only a century old, enacted during the First World War. Earlier, largely free or ad hoc restricted flows of people (e.g., restrictions to Chinese entry to some Australian British colonies during the late nineteenth-century Gold Rush) were "naturally" controlled by the difficulty and the prohibitive cost of international and intercontinental travel. At the time of the so far largest known migration wave in history (relative to population), the transatlantic migration of the late nineteenth-early twentieth centuries, the ocean crossing was a severely uncomfortable affair for people of limited means. A comfortable passage from London to New York on a steam liner enjoyed by the well-heeled was, at the time of the Titanic (1911), equivalent to 6 months of average wages. Therefore, for the working masses, there was no going back and forth. At that time, leaving Europe for America or Australia was the farewell to the homeland and one-way trip into the unknown.

Today's circumstances are vastly different. The global system of nation-states creates reasons for global flows of people and at the same time imposes a system of restrictions to migratory flows. Yet, nation-states seem only able to slow down the professedly unwanted intakes. The core countries are making it more difficult for the Third World dwellers to seek peace and economic opportunity at their doorstep but are unable to stop it. Even not-so-well-off citizens of peripheral and semi-peripheral countries are nowadays supplied by unstoppable information flows and global communication possibilities. They know where they want to go and why, and they also know how to get there; therefore, they do go, even though a human-smugglers-enabled sea passage or tracking through a desert often proves fatal. In recent years, thousands of people have died trying to reach the developed world. Global discrepancies in wealth and economic opportunity and a desire to flee from unsettled or war-torn countries in the Middle East, Africa, and Central America, present an extraordinary motivation for people to migrate, regardless of the risks involved.

Demographic imbalances between nation-states are also an important driver of global migration. High birth rates and lower life expectancy and consequently young populations of developing countries are juxtaposed to the aging populations of developed countries. The median age of the population (according to the 2016 estimate by the CIA World Factbook) of Somalia is 15 years, of Afghanistan and Nigeria just over 18 years, of Eritrea 19.4 years, of Pakistan 23.4 years, of India 27.6 year, and of Algeria 27.8 years. In contrast, the median age of Germans is 46.8, of Japanese 46.9, of the French 41.2, of Britons 40.5, of Americans 39.7, and of Australians 38.6. The Australian Productivity Commission (2016: 14) argues that the "demographic dividend" is one of the main "long-term impacts of immigration" [to developed countries,

in this particular case Australia], secured through migrant participation in the workforce and "reducing the impacts of population ageing" (ibid: 14).

Immigrants are needed in the First World countries, not just for the reason of aging populations and consequent labor shortages. They contribute to the prosperity of "core" countries also a source of cheap and precarious labor for the First World businesses. The USA, with estimated over 15 million of illegal immigrants, is a paradigmatic case of mixed feelings toward arrivals from the south. Many US citizens loathe the "invasion" as something that threatens the country and the civilization itself, fearing "Latinos" who are "splitting the country in two"; others subscribe to a more pragmatic view, though much less loudly expressed, which acknowledges that the country, and especially its better-off citizens and employers, no doubt profit from the "invasion," as they acquire cheap labor for their businesses and affordable "domestic help" for their households.

The issue of migration and the nation-state is not just about demographics and economics. An important consideration in public debates on immigration is the sociocultural consequence of immigration. What is at stake here is a cultural makeup of the nation and what an increasing ethnocultural diversity does to the (national) society. In the "New World" English-speaking settler nations, migration has been a method of nation building for centuries, a method that has always involved explicit or implicit, official or populist, ethnic and racial restrictions, and preferences. Canada, Australia, New Zealand, and the USA all had their versions of racial restrictions that formally ended in the 1960–1970s (in the USA in 1965, in Canada in 1967, in Australia in 1973) but linger on as "White privilege" in the declarations of populist politicians and immigration preferences by a considerable minority – occasionally even majority – of natives.

Since the abolition of formal restrictions to non-European (or "Oriental," as the Canadian Prime Minister called it in his 1947 speech) immigration, the proportion of "non-White" immigration to predominantly "white" core countries, including the main English-speaking countries, is getting steadily higher. Reoccurring debates on the size and composition of immigration intakes rarely mention "race" of immigrants and usually focus on "culture" and "values." For example, a fast growing proportion of "Latinos" ("Hispanics") in the USA gradually changes the census-captured demographic profile of the US population, but it also shows that this population, especially the second and further immigrant generations, is successfully assimilating into the American English-speaking "mainstream." In Australia, at various times since the 1970s, conservative politicians and political commentators have expressed concerns about assimilability of "refugees," "Asians," the "Lebanese," "Sudanese" (and other black Africans, especially refugees), and more recently "Muslims."

People of Islamic faith have represented the key "anathema group" in Western countries over the past decades and especially since the 2001 terrorist attack on the USA (the "9/11"). Western Islamophobia reached its peak in the first presidential decree by Donald Trump (January 2017), banning entry to the USA of citizens of seven majority Muslim countries, the ban that was revoked as unconstitutional shortly after being introduced and then introduced again (March 2017) in a slightly different form. In February 2017, an Australia senator called for an immigration ban from all countries stretching "from Greece to India," clearly targeting the Middle-Eastern majority Muslim countries. Such blanket ethnicity-based immigration bans are not likely to be reintroduced in the twenty-first century, but these calls, also present in the EU, reflect the fears about ethnocultural diversity and an enduring understanding of the nation as "ethnicity-based" and preferably homogenous, "one-nation-one-culture" entity. Such understandings imply an ongoing tension between globalization (leading to the intensification and diversification of migration) and the nation-state.

## Scholarly Approaches to Global Migration

"Migration studies" are an interdisciplinary social-scientific field that assumed a defined form in the 1980s, with a growing number of journals

publishing research in the field. However, research into migration and resulting "ethnic relations" started much earlier. In fact, empirical sociology started through research of migration at the University of Chicago, known as the "Chicago School of Sociology." This is where the first university sociology department started operating in 1892 and the first sociology disciplinary journal was founded (*The American Journal of Sociology*).

The Chicago sociologists of the *fin de siècle* were fascinated by the influx of predominantly rural migrants from central, eastern, and southern Europe into burgeoning American industrial cities. The cities became social laboratories as millions of European peasants escaping rural poverty were transformed into the industrial fodder of steel mills, abattoirs, and factories of the mid-West and elsewhere. The urban life in American cities was challenging for these settlers, and they themselves represented a challenge to the cities, as recorded by the new "science" of sociology. *The Polish peasant in Europe and America* by W. I. Thomas and F. Znaniecki, published 1918–1920 in five volumes, was a major landmark in American sociology. A considerable sociological debate was triggered again in 1928 by Robert Park's article "Human Migration and the Marginal Man." The debate on the effects of migration on migrants and their host societies continued into the 1950s. The early sociologists were eager to help governments and especially city authorities to deal with the challenges posed by large immigration. This is how the challenge of "social disorganization" was described by Herbert Blumer, as a comment to Thomas and Znaniecki's book:

> The Polish peasant reared in a primary group setting, develops a personality which is very dependent, for the regulation of conduct, upon habit and upon the immediate suggestions from his milieu. In a new situation, such as is represented by his residence in the US, he does not have the preparation which would permit him to develop a new life organization with such elements as abstract individualistic morality, religious mysticism and the legal and economic systems which he finds in America. In order to reorganize his life on a new basis, he needs a primary group as strong and coherent as the one he left in the old country. This he is unlikely to find. Consequently, confronted as he is with strange values [...] he is likely to incur demoralization, and this disorganization is likely to become progressive [...]. (Blumer 1939: 67–68)

It may be a legacy of the Chicago School of Sociology that global migration is a priori often seen as a social problem – the assumption is that there is a price to pay for the economic and demographic benefit of migration. So who benefits?

On this issue, the scholarship on global migration is divided into two broad paradigms: the classical migration theory that could be described as structural-functional started with German-British geographer E. G. Ravenstein trying to establish "laws of migration" in 1885. The classical migration theory espouses a "general equilibrium" view of migration: "push" and "pull" factors that propel migrants out of certain countries and places and attract them to certain countries and places work as a variant of the economic "invisible hand." According to this view, migration decreases unemployment in less developed countries while providing labor where it is needed, connecting it with capital in more economically dynamic countries; migration also helps in addressing demographic imbalances between more and less developed countries.

A more recent, critical view of migration perceives it as a process that provides significant benefit to developed countries while potentially harming less developed ones. Global migration provides cheap labor, as well as "brain gain" to developed countries and with the lure of better earnings and life conditions in general, lures the young and educated people from the developing countries, which develop a brain drain in the process. While there is evidence to support both theories, the last wave of globalization has created a tightly knit global capitalist economy where "core" and "peripheral" countries assumed unequal roles and reaped unequal benefits from migratory processes.

## Migration and Development

Migration and human mobility more generally have played a significant role in human history. Over the centuries, travelers and migrants served as conduits for the transmission of new ideas, which accelerated

technological innovation and cultural development (Goldin et al. 2011: 11–12). Since the early modern era's "age of discovery," migration and development accelerated simultaneously.

It can be reasonably assumed that technologically and economically more advanced countries appropriate most of the benefits of migration – even though it is clear that effects of migration are manifold and complex and therefore hard to measure. Over the centuries, more developed countries have profited from migration in various ways. Early forms of using migration for one-sided economic benefit include coerced migration of labor such as the slave trade that brought millions of Africans to the US plantations and thousands of indentured laborers to Australia and elsewhere. A contemporary way of directing the profit of migration to the core countries is through "brain drain" and "brain gain." Core countries attract the best young scholars, professionals, and entrepreneurs to the global technology hubs, the most famous of which is the US Silicon Valley, and to economically dynamic and cosmopolitan "global cities" such as London, New York, Paris, Sydney, Melbourne, Singapore, and many others.

Technological advances that characterize the latest wave of globalization and a transition to a "knowledge economy" in core countries made the tertiary educated migrants the most desirable section of the global workforce. Over the past decades, ICT developments created many new professions. Rapid urbanization and the expansion of tertiary education in the largest Asian countries, China and India, created large outflows and "brain drain," as many educated Asians migrate to the West in search of economic opportunities and better work environments. Asia and the Pacific are the most significant sources of highly skilled workers migrating to the West. For example, more than three-quarters of Indian migrants and more than half of South Korean migrants are tertiary educated.

Unfortunately, a considerable portion of the mobile "human capital" and "global talent" gets lost in transfer through a lack of skills recognition and language and cultural barriers that migrants face in their host countries, leading to a phenomenon known as "brain waste." The core countries have also used imperial expansion by first "discovering" and conquering foreign lands and then creating colonies with a critical mass of population sufficient to ensure efficient exploitation of natural resources of the colonized lands. During the last wave of globalization, more subtle neo-imperial and neocolonial methods are used in the exploitation of peripheral countries, including attracting their best and brightest to leave in search of better opportunities. This process can seriously impede the development of semi-peripheral and peripheral countries within the world system.

## Introduction

Modern globalization is associated with an increased interconnected world where border crossing is the order of the day. International trade and migration, pandemics, natural resource management, and environmental risks represent global challenges that single nation-states can hardly handle on their own. One of the paramount questions today thus seems to be whether globalization has weakened the nation-state. Or has globalization rather contributed to the nation-state's revival? How did nation-states emerge? And how does it relate to globalization? There has been much discussion about to what extent globalization has challenged nation-states or even made them superfluous in a supposedly more and more borderless and increasingly intertwined world. However, what is globalization and what does the nation-state entail?

The scholarship on "globalization" is vast (see Steger et al. 2014) and focuses on increasing trade flows, traffic of people, ideas, products, capital, diseases, and other tangible and intangible elements and developments. While some argue that the history of mankind can be seen as globalization from the start, others refer to phases of massive migration, expansion, imperial conquest, or beginning world trade. Most scholars, however, agree that modern globalization took off in the nineteenth century as a result of the revolutions in industry and transportation and experienced an accentuated acceleration since the 1970s with considerably increased global trade, air travel available to mass tourism, and a rise of study exchanges. The notion of globalization itself is rather new, however, and has various connotations and specifications, economic, cultural, and political (and occasionally environmental) globalization being the most prominent ones. Manfred Steger suggests adding "ideological globalization" to it, which could be considered as the global diffusion of ideas and concepts (Steger 2009). A widely referenced definition describes this process as follows: "Globalization can be taken to refer to [. . .] spatial-temporal processes of change which underpin a transformation in the organization of human affairs by linking together and expanding human activity across regions and continents" (Held et al. 1999: 15). Paul James (2005) provides another helpful definition with a more historical dimension: "Globalization is the extension of social relations across world-space, defining that world-space in terms of the historically variable ways that it has been practiced and socially understood through changing world-time." Globalization always constitutes a much generalized description and needs further differentiation as it aspires to depict processes that are not linear and take shape in various spaces at different speeds. The very wording indicates that globalization is world encompassing and thus per definition crossing borders of nation-states (or even making them irrelevant). A good argument for globalization as a relatively new phenomenon is the development of cyberspace and the Internet, enabling telecommunication at a breathtaking speed, which makes mass communication and social media available anytime anywhere in real time (if equipment, electricity, and a connection are provided). This has not only facilitated trade and produced new online business and changed most societies' and individuals' ways of communicating and using time but also affected diplomacy and international relations and thus the nation-state.

## The Origins of Nation-States and Globalization

International relations (IR) scholars have traditionally taken the nation-state as a starting point, while sociologists in the beginning often associated "society" with nation-states and anthropologists focused rather on local cultures and practices. Historians could be best equipped to analyze globalization and nation-states as the nation-state is only one of the actors and subjects of study among other competing units (O'Byrne and Hensby 2011: 3). The "nation-state" is a topic that has received attention by researchers for much more time than "globalization." "Nation" and "state" are often used synonymously (Wimmer and Feinstein 2010: 765), but this is not accurate as there are states harboring various nations (the Soviet Union or Yugoslavia), nations living in various states, and nations without a state (the Kurds or the Palestinians). It seems helpful to consider the concept of the nation-state as both replacement for and coexisting entity with uniform and patchy, smaller and bigger, more and less centralized, urban, rural, or other forms of organized social, economic, and political life in certain visible or intangible borders with more or less the same or varying rules for hierarchical, multilayered (castes, feudal systems, etc.), or fragmented societies (such as in empires). Throughout history, groups have always distinguished between "us" and "them". However, with more interaction at various levels and over long distances in the modern era, this distinction became more complex. Steven Grosby explains the belonging to a nation with the notion of kinship, where clearly perceptible links or biological bonds are essential. These bonds or links make kinship to a community in which the shared affiliation is so strong that it can also overcome internal disputes (Grosby 2005: 1, 13, 14). It is maybe telling that many currently used national anthems refer to blood or territory or both and thus relate to the mythical community, somewhat extending the imagination that "blood is thicker than water." In other words, family relations (same bloodline) are somewhat extended to the nation, which ideally lives within a certain territory, the state. This image has always tried to keep the "nation" together and perpetuated the "us" and "them" of former social groups. There had already been nations before nation-states came into existence. Paul James correctly states that the "nation" as a notion is much older than modern "nation-states," whose emergence in the nineteenth century accompanied globalization. Thus, it is only possible to understand nations and states by looking at the global historical background (James 2006: 369, 370). In the traditional literature, the birth of the nation-state and an international system built on this concept is – historically somewhat questionable – dated back to the Peace of Westphalia in 1648, following the 30-year war in Europe. A Europe of nations was supposed to supersede religious and other tensions. This seems to indicate that the concept of nation-states was of European origin, which did originally not address multicultural nations (but in a way rather the opposite). This view may, however, be challenged as nations existed all over the world and forms of organized societies somewhat resembled the notion of nation-states. So, was the nation-state a European invention that traveled the world or was Europe coincidentally the first to establish these? James argues that nations are not intrinsically European or western: "European imperial expansion, in the context of fundamental shifts in the modes of practice, was fundamental to nation formation, but this does not mean that Europe provided the blueprint for nation-state formation. Imperial expansion provided the context for a globalizing relation that saw nation-states formed across the world in relation to each other. Each nation-state was "unique," but only made sense in relation to other nation-states." Accordingly, Europe did not provide the blueprint for the formation of nations and nation-states per se. Nation-states emerged in the all but linear context of globalization, which was essential for the creation of nation-states in Europe and other parts of the world (James 2006: 374, 376, 377).

Nations are an important reference for individuals and groups in terms of identification. Benedict Anderson's classic study (Anderson 1983) described the construct of the nation as an "imagined community." Anderson convincingly claims

that the nation also emerged due to the great religions' failure to inspire people's imagination (James 2006: 371). This appears to be true even today, where nationalism appears to witness a reprisal and seems more appealing than religious affiliations, possibly with the exception of certain fundamentalisms. However, ethnicity seems not to be the main basis of modern nations (James 2006: 373). There are multi-ethnic and multinational states, and those nation states that are rather ethnically homogenous with a largely dominant nation. James argues that despite deviations, there were similar patterns in Western, Eastern, "First," and "Third World" nation formation, but it was not simply the imitation of an imported concept (James 2006: 379).

Moreover, it is necessary to look separately at nations, nationalism, and the relationship between globalization and nation-states. If one takes the nation, nationalism, and the nation-state as three interconnected notions, there are different ways to interpret their individual importance and interplay. Wimmer and Feinstein underline that most theories assume that the nation-state model emerged in the United States, France, or maybe earlier in Britain. Besides this rather common starting point, "...many classical authors are somewhat ambiguous as to whether their primary aim is to explain nationalism as a political movement, the spread of national consciousness among a population (i.e., nation-building), or the shift in the institutional set-up of the state (i.e., the creation of a nation-state)" (Wimmer and Feinstein 2010: 767). They all coincide that these three processes are interrelated, even though the interpretations of this interrelation vary. In Benedict Anderson's view, nationalism leads to nation-building and then to the nation-state. According to Gellner, nationalists established the nation-state and then constructed their nation within its border. While Gellner holds that the nation-state emerged via economic modernization, Anderson relates it to cultural modernization. Tilly (1994), Mann (1995), and Hechter (2000), on the other hand, connect the establishment of nation-states to political modernization (Wimmer and Feinstein 2010: 767–768). In their world polity theory, Meyer, Boli, Thomas, and Ramirez try to demonstrate that the nation-state model was a part of a world culture developing over the past 200 years: This "world culture" progressively pushed both elites and political competitors to embrace nationalism and the nation-state as legitimacy basis (Meyer et al. 1997; Wimmer and Feinstein 2010: 769). For Meyer et al., neither nationalism nor nations needed a nation-state to be established. Wimmer and Feinstein (2010: 767) pursue an historical-institutionalist approach, according to which nationalists create nation-states, regardless of previously existing nations. This approach assumes that the rise of new forms of political legitimacy is of exogenous origin and focuses on selection rather than mutation and thus does not encompass the global diffusion of nationalism. The United Kingdom, France, and the United States represented the most powerful first nation-states; therefore others imitated their model: "This diffusion process is neither driven by the hegemonic power of a uniform world culture, nor by domestic modernization process, but rather follows the logic of a decentralized contagion process." Wimmer and Feinstein conclude that the worldwide emergence of nation-states constituted a global trend as a result from uncoordinated local and regional developments that were not created by global social forces. This contagion effect affected the entire globe (Wimmer and Feinstein 2010: 769, 785–786). Meyer and his coauthors (1997: 173) argue that world-society models have formed nation-state identities, structures, and conduct through global "cultural and associational processes," resulting in the creation of nation-states with idiosyncratic features, but also quite uniform patterns (Meyer et al. 1997: 173). In other words, a globalizing trend led to the spread of the nation-state around the world. James holds that diverse forms of nation formation evolved throughout world history linked to different traditional, modern, and postmodern lifestyles. One can regard modern nations as "much more abstract communities" that are shaped by "globalizing practices of production, communication and enquiry, practices that change the nature of how people live in time and space" (James 2006: 369). Even though many "brief history" sections in political science articles hold that the

Peace of Westphalia in 1648 meant the birth of the nation-state, these nation-states did not suddenly appear, but evolved slowly and unevenly. In line with capitalist production, print communication, the exchange of commodities, bureaucratic organization, and rationalized analytical inquiry, nation-states arose in the period of increasing interconnectedness or, in other words, modern globalization. For James, this shows that globalization and nation-states are not opposed to each other, but emerged at the same time (James 2006: 370).

## Nation-States Doomed in the Age of Globalization?

In the late twentieth and early twenty-first century, many social scientists have argued about whether the nation-state is doomed in view of the challenges posed by globalization, neoliberal capitalism, supranational governance, and the need to protect the environment and tackle climate change. Some foresaw the end of the "Westphalian system of nation-states" in view of the rise of global firms, international intergovernmental and nongovernmental organizations, environmental politics, and global norms such as human rights (Suer 2003: vii). This discussion also referred to the end of the East-West block confrontation and the rearrangement of the "core and periphery" relationship between "North" and "South" within "global capitalism." Some authors argue that the nation-state has not been weakened, but adapted to new developments. They challenge the notion of an increasingly less important nation-state in times of "globalization" (O'Hearn and Wilson 2011). Krasner (2001) emphasizes that globalization and the imposition of border-crossing norms is not a new development, even though he holds that some features of the contemporary globalization are novel. Globalization has always been based on uneven, changing, and often contradictory processes, and the nation-states have witnessed various forms of adaptation to these. Besides global free trade, regional and international organizations, also internal forces like radical ideologies, religious fundamentalisms, separatisms, and also the increasing connectedness of global cities defy nation-states in the twenty-first century. All of these internal and external phenomena are a result of or induced by globalization to some extent.

The sovereignty of nation-states represents a most sensitive issue that is believed to be under threat by the effects of globalization, for example, free trade and free movement of products, capital, and people, transnational migration, or pooling of sovereign competences in regional and global governance. National sovereignty is an important feature of the modern state, even though nation-state and sovereign state are not the same concept. The sovereign state is defined by international law as a state with a permanent population, a demarcated territory, a government, and the ability to entertain relations with other sovereign states. However, it can be argued convincingly that there is no single concept of sovereignty. Thus, it is helpful to assume various forms of sovereignty – in terms of definition within the western world (domestic sovereignty, international legal sovereignty, etc.) and as a global phenomenon. As the European notion of sovereign states seemed to be transferred to other world regions in various ways and also varying in practice, it is fair to assume multiple sovereignties. This is also in connection with the notion of civilized states versus uncivilized or barbarian states, supposedly not (yet) fit to have their own national sovereignty. Decolonization formally ended this Eurocentric perspective, but we can identify similar paternalistic patterns in the debates on the North-South or developing versus developed states. An assumed hierarchy of civilizations was matched by different sovereignties (see Gong 1984).

To tackle globalization, international law has played a crucial role. According to the Vienna Convention on the Law of Treaties, no domestic rules may be used to justify a failed application of an international treaty. However, many states have approved international treaties only with reservations. In general, the difference between monistic and dualistic approaches matters; that is international and national law understood as either a single or as two separate legal systems. In

addition, we can critically assess that international law historically has tended to display a western concept of world order through legal rules that leave out alternative understandings and indigenous notions of justice, order, and normative behavior. A good example for this ideal of western norms to improve the world is human rights. International human rights, developed over centuries, have turned into a challenge to national sovereignty in the second half of the twenty-first century. In the aftermath of the Second World War, the Holocaust and in view of the newly established United Nations, human rights turned into a rhetoric reference system that, particularly since the 1970s, also could be used and abused to confront sovereign nation-states. Here, the notion of multiple sovereignties seems helpful as it mostly were countries in Africa, Asia, or Latin America and often smaller states that were criticized for their human rights records. In the 1970s and 1980s, this blame game took place within the East-West conflict and sometimes helped to put pressure on human rights-violating governments, while in other occasions, human rights were used to pursue other interests. Transnational activism, such as international operating nongovernmental organizations (NGOs) to protect human rights, has become part of regional and global governance systems that seem to challenge nation-states' authority to carry out domestic policies autonomously (see Keck and Sikkink 1998). A further development of the concept of humanitarian interventions to the so-called Responsibility to Protect (RtP) can be seen as connected to the human rights discourse and as a reaction to the "international community's" inaction during the Rwandan genocide in 1994. However, RtP was also criticized as a potential tool for western invasions in other world regions based on the pretext of human rights concerns. RtP mostly concerned countries that were classified as "failed states," and their peoples' protection thus considered to be a responsibility of the "international community," which implicitly meant that these states no longer were sovereign. A problem of the well-meant RtP approach was that it often came along with claims for regime change and democratization. To help a suffering population against hunger, chaos, or massive human rights violations is one issue. However, to promote regime change in these nation-states is certainly an understandable, but not uncontroversial call, which has often been perceived as western neo-imperialism to replace unwanted leaders. A similar argument was brought up by several African leaders against the International Criminal Court (ICC), established in 1998: These governments rejected the court as a western tool to try African heads of state in particular. Interestingly enough, the United States, traditionally also uneasy about too rigid human rights restrictions (death penalty, economic rights, torture of terrorist suspects abroad), denounced the ICC even though the Clinton Administration once had signed the Statute. Since the terrorist attacks in the United States in 2001, the guarantee of human rights and the fight against terrorism – both within the western societies and in wars abroad – has been a conflictive issue. Nation-states often circumvented national human rights legislature by using other nations' intelligence information on their own citizens or by sending terrorist suspects to third countries, where western human rights laws do not apply. This could be described as a peculiar form of deterritorialized security. In sum, global human rights campaigns by international NGOs and intergovernmental human rights bodies at regional or global level as well as the Responsibility to Protect increasingly challenge less strong nation-states' sovereignty. One international institution that holds up "European values" such as human rights, democracy, and the rule of law or gender equality, is the European Union. Some predicted the benefits of supranational governance (instead of national solutions) in an increasingly globalized world. In the second decade of the twenty-first century, it would be easy to discharge his optimism as untimely in view of "new nationalisms," the crises of the EU and the rise of other, often quite nationalistic powers in other world regions. Interestingly enough, the European Union has internally dismantled some features of national sovereignty by pooling certain traditional competencies of the nation-state to supranational organs (the European Commission above all) such as trade policy. Due to its

supranational features and complex structures, the European Union can be regarded as the most peculiar institution of global governance, but there are many other international organizations. These entities evolved first in the mid-nineteenth century as a (European) reaction to evolving challenges of increasing trade or the early modern forms of globalization. Several regulations; normative, measuring, and standardizing bureaus; commissions; and unions saw the light of day, and some of these early institutions still exist in a changed version today, such as the International Telecommunication Union or the Universal Postal Union. International institutions – in the nineteenth century until the twenty-first century – were considered to tackle border-crossing problems, prevent wars and facilitate transnational trade, security, and health cooperation, or improve economic conditions in certain parts of the world. The evolution of international organization and growth of intergovernmental and international nongovernmental institutions and transnational networks have been depicted as global governance – in the absence of a world government. Global governance is a contested notion as it is not clear if it exists or should exist and whether it promotes only western values such as democracy, human rights, or the rule of law to (further) dominate world politics. This notion of "governance without government" somehow diverges attention from organizations and actors (and their weaknesses) toward policy areas. Moreover, global governance promises a more positive connotation, even though the old actors and organizations are naturally participants as well. Is global governance thus an artificial notion that describes what has already been out there before? Old wine in new tubes? A charming advantage of global governance is that it blurs the western agents, even though the implied concepts and policies are by and large similarly western centric. The concept seems to demonstrate that nation-states seemingly no longer can address global challenges alone, while the more influential states still can make a difference in terms of advocating or blocking global initiatives. To tackle environmental problems, global warming and climate change are clearly among those challenges that both require global governance and provoke very different responses from individual nation-states. Historically, the Congress of Vienna, for many the prototype of modern international organizations, the League of Nations, and the United Nations all based on nation-states as principal members to legitimize their policies. This is one of the reasons why the UN has often been criticized to be an outdated institution that can hardly tackle the global challenges of the twenty-first century. Given its idiosyncratic structure with a Security Council that reflects power relations in 1945, it is hardly a flexible institution that can take action against in the most urgent policy areas (conflict, environment and natural resource management, global inequality, or migration) against the will of its most powerful members. Only twice, the composition of the "Permanent Five" changed: In 1971, when the People's Republic of China as a result of US-Sino rapprochement replaced the Republic of China (Taiwan) as member of the UN and Permanent Member of the Security Council and in 1991 when the Russian Federation "inherited" the dissolved Soviet Union's permanent seat on the Security Council.

However, the dramatic changes in communication have also affected nation-states and international organizations. While diplomacy now has to react in real time to events and threats, diplomatic communication between two or various nation-states (EU, NATO, for instance), international business, or even transnational intelligence cooperation seem to be routinely outwitted by private and stately organized hacking. To protect business secrets, intellectual property or diplomatic notes, and intelligence reports appears to be a never-ending Sisyphean fight against hackers and transparency activists like WikiLeaks, making nation-states to some extent untrustworthy as safe havens. Nondemocratic governments have tried to restrict access to critical websites or as China built the Great Firewall, but in general it seems difficult to regulate the Internet and telecommunication in a globalized world within

national boundaries. Terrorism, cyber criminality, organized crime, and cyber warfare in fact use the borderless virtual world. There emerged calls for an international institution to deal with these challenges and to regulate the Internet. Some suggested the rather old-fashioned International Telecommunications Union to do this, which mirrored the somewhat quixotic belief in intergovernmental solutions. But it seems clear that it is nearly impossible to apply national laws online as skilled users can succeed to servers in other countries. In cyberspace, the limits of nation-states have become obvious.

## Opposition to Globalization

Newer populist opposition to multilateral cooperation, global free trade, and continued immigration was also fueled by the impression that multinational companies were gaining more and more influence over the fate of people, while their national governments seemed to follow Margaret Thatcher's motto T.I.N.A. – there is no alternative (to market economy and free trade). Globalization has been perceived as multinational companies trumping over national interests as they could move on to the next country with better conditions. Transnational companies have been criticized as they have bigger financial clout than many smaller or midsized nation-states and thus can put pressure on these. The fact that foreign direct investments rather went to countries with low taxation, few corporate social responsibility (CSR) regulations, and cheap labor, ushered in disappointment, disorientation, and a sensation of powerlessness in view of citizens' democratic influence. There were some official, intergovernmental, and supranational attempts to address the negative repercussions of globalization in terms of social security in rich societies and worrisome working conditions in poorer societies. The International Labor Organization, built on the tripartite system (employer, employee, state) prevalent in western societies, had difficulties adapting to problems of workers in informal labor markets or other challenges related to a globalized labor market. The UN and multinational companies introduced in 2000 the Global Compact that together with CSR should put some moral pressure on firms to respect certain social norms when doing business in any world region, and the European Commission established in late 2006, for instance, a Globalization Adjustment Fund for workers made redundant by globalization effects. The International Standardization Organization also tackled the issue by launching new norms dealing with good management, environmental sustainability, CSR, and human rights concerns. Nevertheless, the impact of these initiatives was either too small or not felt by the people who saw themselves threatened by the consequences of globalization of the labor market or continued migration. As a result, the so-called anti-globalization movement(s) developed (mostly in richer societies at first) and promoted a variety of different approaches than the neoliberal dogma. The protests against a neoliberal economic world order started probably with the Mexican Zapatista uprising against the North American Free Trade Agreement between Canada, the United States, and Mexico in 1994. Several local and international movements followed, loosely organized in the World Social Forum. One of these organizations, Attac, was quite successful for a while, endorsing the so-called Tobin tax on all international stock market actions to discourage speculative short-term interests harming societies. Interestingly, this opposition was organized across borders as well, but in the end failed to mobilize larger groups in society and to develop sustainable and influential networks across borders and continents. Even though there was hope that a somewhat illusory global civil society would serve as a correcting element against neoliberal unfairness and other forms of injustice, it was almost impossible to reach international solidarity as the interests of the global justice movement(s) were quite diverse. The left-wing opposition to a globalization of markets, finance, trade, and labor was never alone in its skepticism of a neoliberal globalization that seemed to

weaken the nation-states. Populist and nationalist groups have always been critical and afraid of a borderless world. The recurrence to national and often related ethnic identities seemed to serve as an anchor of orientation in an otherwise chaotic and complex world. For some left-wing opponents of a neoliberal globalization and nationalistic critics, claiming the priority of the own citizens, a reorientation to the nation-state was considered to be the solution. A new combination of rather classic redistribution policies and a focus on the citizens of nation-states sometimes blurred the lines of right and left, as they affected parties across the board and demonstrated frictions within parties, bypassing traditional ideological divisions. While some challenge nation-states as somewhat coincidental or artificial "imagined communities" and thus cherish multicultural societies and corresponding multiple identities (national, ethnic, gender, cultural, sexual, etc.), others seem eager to reinvigorate the nation-state as the most powerful identity reference, often accompanied by skepticism or rejection of double or multiple citizenships. Many nations in all world regions have rhetorically reinforced the notion of national sovereignty in recent years, which also led to rethinking of regional and global trade, the influx of migrants, border security, civil and human rights, international treaties (refugees), and international cooperation as such. The most prominent example in recent times appears to be the British referendum on Great Britain's future within the European Union, commonly known as "Brexit": Here, EU-skeptical and populist politicians succeeded in convincing the electorate that Britain's interests would be best served without EU membership. Donald Trump's election as US president in 2016 and his proclamation to put the United States first and reconsider collaboration with multilateral agencies in view of national benefits can be seen in this light as well.

## Conclusion

It seems that the nation-state has always been a different imagination, concept, and practice in different regions and periods, challenged or enforced by changing internal and external developments. Globalization has also changed over time and meant something quite different in various regions at various times. The nation-state has neither emerged everywhere at the same time nor become eroded all of a sudden all over the world in the same manner as a result of globalization. In other words, the geneses are not clear and the same holds true for the supposed western origins. In a proto version, globalization can be traced back to imperialism or even the beginning of mankind, while nation-states developed along with the early modern phase of globalization in the nineteenth century. The nation-state has always been an evolving construct that changed and had to compete and interact with alternative ideas, ideals, and identities that produced new actors such as international organizations, NGOs, multinational companies, international courts, global terrorist and criminal networks, or transnational religious communities. In other words, there has been no linear process. The nation-state has become less influential in terms of decision-making in many policy areas, but seems to have gained importance with regard to the desperate quest for a stable identity in times of flux, complexities, and parallel societies, both virtual and real. This appears to be natural, even though the myopic focus on ethnic communities as only representatives of nation-states should be rejected. Globalization has in various ways relativized or even weakened, but at the same time strengthened the nation-state as an actor and reference point. Rather than seeing the relationship between globalization and nation-states as dichotomic, it seems reasonable to conclude that nation-states are part of and contribute to shaping globalization, while they are at the same time constantly challenged and transformed by the consequences of globalization. Nation-states and globalization have always been connected, and the nation-state will likely survive but continue to compete with other models and affiliations promoted by globalization processes.

G

## Definition

Globalization: the fast movement of people, commodities, and ideas in an ever-shrinking world.

International institutions: sometimes referred to as international governmental organizations (IGOs), typically constructed as an international alliance between state actors on the global stage.

International organizations: typically constructed as either international nongovernmental organizations (INGOs) or nongovernmental organizations (NGOs) that operate internationally.

## Introduction

In an increasingly connected world, international organizations that function outside of state boundaries play important roles in economic growth, development opportunities, peacekeeping, and crisis and humanitarian interventions. While state actors and the alliances they form (global organizations) are key to international relations, INGOs, NGOs, and transnational advocacy networks play key roles in the exchange of people, commodities, and ideas central to helping states achieve their goals. Alongside these types of organizations, there has also been an uptick in the number of terrorist organizations (for more information, see Globalization and Terrorism and Counter Terrorism and Community Resilience).

There are three major types or categories of international organizations: institutions, organizations, and regimes. International institutions are created by states to address issues in a narrowly defined agenda (e.g., the United Nations, the European Union, the World Bank). The UN and EU can be considered formally designated organizations comprised of state actors. International organizations are typically conceived as non-governmental organizations that work between state actors (e.g., the Red Cross, Doctors Without Borders). International regimes include the norms, rules, and expected behaviors on the global stage. If regimes are the rules of the game, international institutions and international organizations are the players (alongside state actors). Organizations relate to one another in complex ways, sometimes forming complex networks. The following discussion outlines the role of IGOs, INGOs and NGOs, international financial institutions, and transnational advocacy networks.

## Intergovernmental Organizations: The United Nations

The United Nations (UN) is an intergovernmental organization consisting of state actors. Five members, including, China, France, Russia, United Kingdom, and the United States comprise the United Nations Security Council, which gives those five states veto power in the UN. The United Nations Development Programme (UNDP), a branch of the United Nations focused on global development projects, established Millennium Development Goals in 2000 and outlined a quantifiable set of development goals for the world. The deadline for the following goals was 2015:

- Goal 1: Eradicate extreme hunger and poverty.
- Goal 2: Achieve universal primary education.
- Goal 3: Promote gender equality and empower women.
- Goal 4: Reduce child mortality.
- Goal 5: Improve maternal health.
- Goal 6: Combat HIV/AIDS, malaria, and other diseases.
- Goal 7: Ensure environmental sustainability.
- Goal 8: Develop a global partnership for development.

The United Nations Development Programme was successful because they brought to bear important human rights issues in an organized, global framework. The UNDP was criticized because the goals were formulated by developed nations, creating a top-down approach to solving these complex, global issues.

The new program proffered by the UNDP is a set of 17 Sustainable Development Goals in January 2016 (UNDP "Sustainable Development Goals" 2016):

1. No poverty
2. Zero hunger
3. Good health and well-being
4. Quality education
5. Gender equality
6. Clean water and sanitation
7. Affordable and clean energy
8. Decent work and economic growth
9. Industry, innovation, and infrastructure
10. Reduced inequalities
11. Sustainable cities and communities
12. Responsible consumption and production
13. Climate action
14. Life below water
15. Life on land
16. Peace, justice, and strong institutions
17. Partnerships for the goals

Now that the era of Millennium Development Goals has passed, there has been a widespread call for establishing Sustainable Development Goals. One approach in creating and implementing Sustainable Development Goals is to continuously ask for and reflect seriously on input from developing nations, rather than the process of a few developed nations formulating development goals for less-developed states (Rosenbaum 2015). Traditionally, because rational state actors are considered the priority players on the global stage, IGOs are considered a priority organization type, with power to set the international agenda, control policy outcomes, maintain global peace and security, and establish international trade agreements.

## International Financial Institutions: World Bank and IMF

At the close of World War II, an internationally recognized need for global economic stability emerged. One result was the Bretton Woods Conference, which established the gold standard and international economic norms, including the International Monetary Fund and the International Bank for Reconstruction and Development (later, the World Bank). Establishing economic norms meant tying currency to a fixed gold standard and a system of fixed exchange rates. The result of the international meeting was an established global economic system aimed at increasing economic stability and economic security in the postwar world.

The International Monetary Fund and the World Bank are international financial institutions that provide lending services and aid to developing state actors. When funding strengthens accountability within a state, external aid has the potential to increase democratization efforts (Birchler et al. 2016). The goals of both organizations have shifted to include poverty reduction, alleviation of financial crisis, and assisting developing states to achieve their development goals. While both institutions share these characteristics and goals, the IMF is focused closely on maintaining repayment systems among states, whereas the World Bank is focused more on development.

An opposing perspective is that organizations like the International Monetary Fund have increased economic instability rather than lead to planned economic growth and development (Stiglitz 2004). When developing nations are dependent on funding from international financial institutions, serious problems can and do arise when the global economy shifts. While the role of the IMF in offering loans to developing nations in the face of financial crisis is an important one that needs to be fulfilled, short-term development loans to the poorest state actors have failed and lead to desperate conditions and failed markets in those states (Easterly 2006). Demands for increased transparency have largely been met by the World Bank, but the IMF lags in this regard; intermediaries play a key role in holding international financial institutions accountable (Gartner 2013). The primary goals of economic stability and development are needed functions served by the World Bank and the IMF.

## Nongovernmental Organizations: Amnesty International

The key difference between intergovernmental organizations and international financial institution organizations is that nongovernmental organizations do not formally include state or governmental actors. Thus, nongovernmental organizations work in between, against, or with state actors to enact change. Often, NGOs are issue bound.

Amnesty International is considered a watchdog organization, dedicated to keeping government actions and governmentally sanctioned injustices in check. They boast a membership of seven million and members are not bound to a specific nation, state, nation-state, or other formal affiliation. The organization supports international human rights, freedom from unjust imprisonment, and actively opposes torture. The organization has several goals: to conduct rigorous research, participate in advocacy and lobbying efforts, and promote campaigns and activism that fold into the organizational goals established by Amnesty ("What We Do," current). Amnesty International focuses on international social and political rights issues, including: corporate accountability, detention, disappearances, freedom of expression, indigenous peoples, international justice, sexual and reproductive rights, torture, and working with the United Nations ("What We Do," current) (Keck and Sikkink 1999).

To offer a specific example, Amnesty is dedicated to relieving unfairly imprisoned individuals from prison facilities and abolishing the death penalty. In the late 1970s, the organization pressured the Council of Europe (CE) to include abolition judicial death penalty in all member states to the agenda. While the measure failed (a version of it was later passed in 2002), this

example highlights the importance of NGO work to change an IGO agenda and highlights the ways NGOs and IGOs can work together (Sithole 2016). Nongovernmental organizations express power on the global stage in ways that are different from their IGO counterparts and state actors. Measuring the effectiveness of nongovernmental organizations is a difficult task and begs a central question in international relations debates: where is power located on the global stage?

## Transnational Advocacy Networks

International relations include several actors: states, non-state actors, and international organizations. Keck and Sikkink term networks of cooperative and activist international organizations *transnational advocacy networks* (TANs 1999). Central to the notion, TANs are the shared values and information exchange which make advocacy possible. TANs reach beyond the conceptualization of state actors as rational and are thereby able to advocate for state interests that are not rational. Further, activists and advocacy networks can work together to increase the voice of weaker state actors, shedding light on their concerns and bringing the concerns of weak state actors into international conversations. Advocacy can also result in changing the rules of the game by refocusing attention away from state actors and looking at complex issues from a moral rather than rational standpoint.

Transnational Advocacy Networks aim to maintain long-term and sustainable movement in relation to the narrowly defined issue. Rather than being defined by the actors included in the organizations, TANs emphasize a specific issue agenda. Often, these have moral or emotional appeal and a cosmopolitan or humanistic notion. This long duration and high degree of cooperation aims to foster coalitions, expanding the network and increasing the impact of the movement (Tarrow 2005). Often, long-term sustainability in movement is a good indicator of success for achieving the advocacy network's goals.

To offer a concrete example, climate change is a recent environmental paradigm focused on raising awareness of climate issues. Multiple networks serve as advocates for the issue, including gender equality advocates, indigenous peoples, and waste pickers, groups who build networks and advocate for change in the same issue area (Ciplet 2014). A question remains about how much impact these networks have: perhaps these organizations are successful at gaining recognition for climate injustice, but they seem to have little impact when it comes to combatting rigid international power structures (Ciplet 2014).

## Conclusion

Different actors and groups of actors on the international stage all embody different forms and functions. These state and non-state actors come together in different formulations to create organizations. The classification of non-state actors as organizations, institutions, or advocacy networks is a limited project. It is perhaps more important to understand the specific purposes and functions of a given organization. Many scholars in international relations carefully evaluate the successes and failures of those institutions and make careful observations about how organizations interact with one another. Knowing how and when organizations are successful or unsuccessful illuminates which actors and organizations have power to set the global agenda, influence policy, regulate economies, and advocate for a wide range of human and environmental rights. In an increasingly globalizing word, the role of organizations and institutions remains paramount to understanding the distribution of power on the global stage and how international norms are established and change over time.

# Globalization and Pollution

Dave Mercer
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Synonyms

Food contamination; Greenhouse gas emissions; Health impacts; Limits to growth; Nuclear weapons testing; Risk society; Toxic waste trade

When the Club of Rome's influential report, *The Limits to Growth* (*LTG*) (Meadows et al. 1972), was first published, it provoked widespread criticism and, indeed, ridicule, on the part of many "pro-growth" advocates and technological optimists for both its methodology and unduly pessimistic conclusions about the trajectory of the world economic system and what the authors saw as the inevitable, environmental consequences. Focusing on five key elements, the document highlighted the ongoing exponential growth in *global population*, *resource depletion*, *food production*, *industrialization*, and *pollution*.

While this offering concentrates on the last item (defined, narrowly, in *LTG* as atmospheric carbon dioxide concentration), it is important to recognize that all five elements are intimately related and generate constantly changing and complex, nonlinear, feedback loops. Population growth, food production, and industrialization, for example, fuel accelerating resource depletion which then creates externalities in the form of pollution. This, in its turn, can often have serious negative consequences for productivity, population health, and growth, especially in low- and middle-income countries subject to runaway pollution from multiple sources.

For the purposes of the initial Club of Rome (*LTG*) exercise, a computer simulation model (World3) varied the metrics of the five variables noted above to produce three alternative scenarios – or "futures" – of the earth/economic system. Of these, two pointed to a dystopian future characterized by "overshoot and collapse" by the mid-twenty-first century. Controversially, the report's authors cast considerable doubt on the capacity of technological innovation ("clean coal," geoengineering for climate change, genetically modified crops, etc.) to address current trends and halt a coming ecological collapse.

## Pollution, Population, and the Anthropocene

In the intervening years since the report's release, much has happened to vindicate many of the core findings. Without precedent in human history,

G

world population growth progressed rapidly through the two, three, four, five, and six billion thresholds in the twentieth century. It now stands at 7.2 billion and is projected to exceed nine billion by 2050. Inevitably, this has spawned vastly increased – and ultimately unsustainable – consumption levels of energy, food, water, and natural resources of all kinds as well as associated waste production. Rapidly rising standards of living in some of the world's most populous nations (India, China, Indonesia, Brazil, etc.) are compounding the pressures. Each year the Global Footprint Network calculates what has become known as "World Overshoot Day." This is the precise date in that year by which the world has consumed a full 12 months' quota of renewable resources. For 2016, that day was August 8. In 1990, it was December 7 (www.footprintnetwork.org).

The concepts of "peak oil," "peak water," and "planetary boundaries" are now commonly invoked and widely accepted in many academic and policy circles (Hayha et al. 2016). In acknowledgment of the enormous power of human actions over the long term to bring about fundamental environmental changes, a working group of scientists is currently engaged in the process of deciding whether or not the current geological era should officially be named the "Anthropocene" (Casagrande et al. 2017).

One inescapable fact is that, following some 10,000 years of relative earth-system stability in the Holocene, we now appear to be in a phase of uncharted instability. Largely as a consequence of the large-scale (anthropogenic) mining and burning of fossil fuels, carbon dioxide levels in the atmosphere, for example, have been rising steeply in recent decades. In 1958, the level of concentration was 316 parts per million (ppm). But in 2016, the symbolic 400 ppm threshold was breached. The last time the earth had a concentration of this magnitude was three million years ago, and it translated into the hottest year on record since detailed readings were initiated in 1880. What is especially disturbing is that the increase in CO2 is now accelerating at around 2.1 ppm per year (Gaffney and Steffen 2017).

The Intergovernmental Panel on Climate Change (IPCC) represents arguably the most inclusive and successful enterprise in international collaboration and consensus building among scientists that the world has ever seen. If unchecked, under a business-as-usual (BAU) scenario, the alarming prognosis of the fifth and most recent (AR5) report of the IPCC (2014) is that the year 2250 could witness an elevated concentration level of the order of 2000 ppm. This would see a global temperature rise of some 9 °C above pre-industrial levels, with catastrophic consequences for sea-level rise, extreme weather events, crop production, the spread of diseases, and water scarcity. The IPCC's (2014: 8) assessment could not be more blunt. A continuation of the present growth trend in emissions, they note, will generate "severe, pervasive, and irreversible impacts for people and ecosystems." Indeed, all over the world – from the Arctic to sub-Saharan Africa and low-lying Pacific Island nations – we are already witnessing ominous signs of an unfolding, global "unliveability" scenario. What this highlights above all is the total inadequacy and outmoded nature of both the hegemonic narrative of progress and current global institutional arrangements (e.g., climate agreements struck in Kyoto (1997) and Paris (2015); numerous, aspirational UN environmental conventions; and the Green Climate Fund) to even start to deal with such serious global issues.

Turner's (2014) detailed analysis of the reliability of the Club of Rome scenarios finds that we are well on track to fulfilling many of the more pessimistic conclusions including impending, dramatic population decline. Building into his argument consideration of the recent, global financial crisis, a coming energy crunch, and the ongoing problem of unsustainable debt, he highlights the absurdity of economies constantly seeking to "grow" themselves out of the financial abyss. Short-term electoral cycles are a major, contributing factor. He concludes (p. 14) "...a relatively rapid fall in economic conditions and the population could be imminent."

A key point to emphasize at the outset is that there is no direct line of causation between absolute population numbers and pollution metrics. Individuals, as well as regions and nation-states, vary enormously in terms of their resource

consumption, waste generation levels, and ecological footprint. In addition, the worldwide, military/industrial complex has much to answer for in this regard.

## Risk Society: Chernobyl and Fukushima

Fourteen years after the release of *The Limits to Growth*, sociologist Ulrich Beck's best-selling book, *Risikogesellschaft*, was published in Germany. It later (Beck 1992) appeared in English as *Risk Society*. Building on the increasingly vociferous, and well-articulated, arguments of the global environmental movement over the previous decade, Beck's central argument was that in preindustrial epochs, people were overwhelmingly vulnerable to the dangers (pollution) posed by natural disasters, such as volcanoes, fires, floods, epidemics, and earthquakes, but that in modern times, we have become much more vulnerable to broadly defined "technological" risks (food contamination, nuclear power- and chemical-plant accidents, toxic oil spills, etc.). Invariably, these transcend national boundaries, cannot be insured against, and have proven almost impossible to regulate. Moreover, he argued the "new" environmental risks with their global reach are not merely a minor – and "manageable" – by-product of modernity but are its *central product*. Coincidentally – as if on cue – his book appeared in the same year (1986) as the catastrophic meltdown at the Chernobyl nuclear power plant in the Ukraine and only 2 years after the massive Bhopal pesticide plant industrial accident in India.

What Chernobyl underscored was that not only do technological disasters of this kind produce far-ranging impacts, but they also do not discriminate between victims on the basis of class, income, or nationality. The explosion at the plant contaminated an estimated area of 100,000 $km^2$ across Russia, Ukraine, and Western Europe with radioactive fallout. The effects are still being felt today in terms of ongoing health, cleanup, and infrastructure containment costs. Radioactive elements will remain in the soil, groundwater, and food for thousands of years. Plutonium, for example, a by-product of nuclear power generation, retains its radioactivity for some 250,000 years. One estimate is that, by now, at least one million premature deaths from various cancers, endocrine disorders, and child deformities can be directly attributed to the Chernobyl accident (Nesterenko et al. 2009).

The International Nuclear Event Scale (INES) ranks incidents on a scale of 0–7, where 7 is the most serious ("widespread health and environmental effects"). Chernobyl scored a 7 rating as did the March 2011 Fukushima Daiichi nuclear power station disaster in Japan. Interestingly, Fukushima provides an example where both uncontrollable "natural" forces (earthquake and tsunami) and a litany of major, human-induced, technological, and regulatory failures came together at the same time. Such a fatal combination is almost certain to erupt at some stage elsewhere in the world in the future. Over 150,000 people were evacuated immediately, and ongoing cleanup costs have so far amounted to USD 13 billion.

Every indication is that the caesium-137 and iodine-131 releases from Fukushima (where three reactors melted by comparison with only one in the Ukraine) have been far higher than from Chernobyl. Radioactive dust rose quickly to 5 km above the nuclear plant where the jet stream then moved it rapidly around the globe. Dust was identified over the western United States and British Columbia only 3 days later and in Europe a week after that (Chossudovsky 2012). The sea, too, has been seriously contaminated, with major repercussions for the fishing industry and public health. One "globalizing" consequence has been heightened anxiety about the dangers of nuclear power generation and expansion plans in such countries as the UK, Germany, France, and Italy. Fears of radioactive contamination have also had a serious impact on Japanese trade. Nissan's engine plant at Iwaki is only 40 km from Fukushima. As a consequence, following the accident, Japanese automobiles and car parts destined for the Russian market were confiscated at the port of Vladivostok because of almost certain irradiation.

## Air Pollution/Haze

In Southeast Asia, serious haze pollution episodes have been a common occurrence in recent years. Originating largely from slash-and-burn forest clearing on a massive scale in Indonesia, the resulting haze has frequently produced widespread health and economic impacts on some 75 million people in neighboring Singapore, Brunei, Malaysia, and Thailand and has severely strained relations between these countries and Indonesia. For Singapore alone, the especially serious 1997 haze event has been calculated to have totaled somewhere between USD 163.5 million and 286.2 million in health costs, lost productivity, and tourism revenue. Poor visibility in that year has also been blamed as the cause of Indonesia's worst airline disaster when 234 people died (Islam et al. 2016). Paradoxically, much of the slash-and-burn clearing is carried out by Malaysian and Singaporean companies with close ties to the Indonesian government.

As a rule more affluent countries have considerably higher average levels of resource consumption, but they also often display much stricter environmental regulatory standards. This means, for example, that the air quality in cities such as Paris or New York, while still not perfect, is generally far better than in the large metropolitan centers of China, Indonesia, or India. Needless to add, prior to concerted cleanup policies, cities in the "developed" world also experienced serious photochemical smog (or haze) episodes resulting in thousands of deaths. This was the case in Los Angeles in the 1940s and London in 1952. In the latter city, as many as 12,000 have been estimated to have died as a result of serious air pollution in December of that year.

More recently, there has been a serious deterioration of air quality in the UK generated by large-scale nitrogen dioxide emissions from diesel motors. This has prompted the European Union to order Britain and four other member countries to radically reduce their automobile emissions or risk prosecution in the European Court of Justice (de Freytas-Tamura 2017). With over 90% of the world's population now living in areas deemed to have a serious air pollution problem, and causing around three million deaths a year, the World Health Organization (2016) has recently identified ambient (outdoor) air pollution as the single most important risk to global health. (As an aside, this is already impacting on the willingness of many potential expatriate corporate employees to relocate their families for periods of employment in several Asian cities (Holliday 2014).)

Mongolia's capital, Ulaanbaatar, illustrates the clear connection between poverty and extreme air pollution levels. In the often severe winters, the tens of thousands of residents living in the city's poor slum districts turn to whatever heat source they can to keep warm. In addition to coal and wood, this often involves trash of all kinds, much of it contaminated. As a consequence the city experiences winter toxic smog that is among the worst in the world. The most harmful particles are known as PM2.5, and according to the WHO, an acceptable standard is 20–25 micrograms per cubic meter. Commonly, Ulaanbaatar experiences levels of between 800 and 1000. While Tianjin and Beijing do not reach levels of this severity, pollution in all major northern Chinese cities is becoming worse because of changing weather patterns caused by increased carbon dioxide levels in the atmosphere. In particular, average wind speeds have dropped dramatically over the last 50 years meaning that the haze now takes much longer to disperse (Li et al. 2016).

Interestingly, recent years have demonstrated the potential "reputational power" of such high-profile international sports' institutions as the Olympic Games' movement to initiate dramatic air and water quality improvements in normally highly polluted cities. In 2007 – caused, in large measure, by unregulated emissions from large numbers of aging coal-fired power stations – China had the dubious record of recording 16 cities on the list of the 20 most polluted places on earth. But then came the lure and prestige associated with hosting the world's most high-profile sporting event. In environmental terms, the 2008 XXIX Beijing Olympiad example is legendary and shows what can be achieved by an authoritarian regime in a very short period. Using temporary industrial plant closures and upgrades, as well as robust emission and traffic controls, an estimated

US$10 billion budget was allocated to clean up the city's atmosphere in time for the Games. This has been described as "arguably the largest natural experiment in air cleaning" (Chen et al. 2011: 2). Unfortunately, the improvement was only short lived. Within a year the air quality had deteriorated to its pre-2008 state.

## Transparency and the Global PR Machine

The Beijing case highlights an important feature of pollution, and that is its *highly political* nature. Historically – facing international outrage, embarrassment, or even potentially massive compensation payouts – both corporations and nation-states have often gone to great lengths to deny, cover up, or downplay the seriousness of pollution and related industrial accidents. Increasingly, this has involved the generous financial support of conservative think tanks, lobbyists, and global PR companies such as Burson-Marsteller (Miller and Dinan 2008). The extraordinary reach and power of a relatively small number of transnational corporations are a defining feature of our times. Operating across the globe in the resources, agrifood, energy, and chemical sectors, these conglomerates can and do exert disproportionate influence over individual nation-states, research institutes, and universities, as well as in the formulation or weakening of environmental standards, regulations, laws, and agreements (Starobin 2013).

Coal is Australia's leading export commodity. As, currently, in Germany, Bangladesh, and Thailand, it is also the focus of growing opposition from the renewable energy sector and environmental NGOs because of its unacceptable contribution to greenhouse gas emissions and climate change. But through the well-endowed Minerals Council's "COAL21" campaign, the industry is fighting back with a concerted PR and advertising push that saw it contributing AUD 2.5 million to the generation of a suite of "clean coal" advertisements in the lead-up to the 2016 federal election. In Australia, expenditure of over $13,000 on electoral matters by "third parties" must be declared to the Electoral Commission (Aston 2017).

Large corporations, too, are often greatly assisted by invoking the powers that exist under public law, investor-state dispute settlement (ISDS) legal regimes. When countries have entered into free trade pacts, ISDS grants corporations the right to sue individual states if regulatory controls are deemed to be negatively impacting on their commercial operations. There have been several instances of companies successfully suing countries for "excessive" environmental regulation. This is currently a highly contentious issue as the Comprehensive Economic and Trade Agreement (CETA) between Canada and the European Union edges closer to full ratification. Amid widespread public demonstrations in Europe, one of many concerns is that Canadian mining companies operating in places like Arctic Finland potentially could flout exacting European standards with regard to the disposal and treatment of mine wastes but be legally protected by ISDS. Canadian tar sand developments in Alberta are some of the most polluted places on earth.

Through constant mergers, transnational corporations are becoming larger and ever more powerful as they secure tight control of webs of global supply chains. Shortly, we shall be discussing some of the recent activities of BHP Billiton, now the world's largest mining company. That corporate giant, with total assets of over USD 130 billion, was born in 2001 through the marriage of Australia's Broken Hill Proprietary Company and the Anglo-Dutch company, Billiton. And at the time of writing, negotiations are well under way for another proposed merger between Bayer and Monsanto. This would create an agribusiness and chemical megacorporation that would effectively control the majority of the inputs (seeds, fertilizers, pesticides) into the global food system. Monsanto-patented GE seeds now account for 90% of corn and 94% of soybeans grown in the United States. The implications for food security and farmers' rights in developing countries are profound.

Interestingly one of the first acts of the new, Trump administration in the United States was to

back the Bayer/Monsanto merger proposal and also ban the publication of Environmental Protection Agency (EPA) data until it had been thoroughly vetted by political appointees (Strom 2017). This is an agency that, critics point out, already has far too limited powers under the weak *Toxic Substances Control Act* (1976) to effectively regulate and adjudicate upon the safety of literally thousands of chemicals that are already widely used.

## Monitoring and "Naming and Shaming"

However, in this age of high-resolution satellite imagery and a range of other technologically advanced tools, hiding or distorting evidence of environmental harm is becoming much more of a challenge. The Chen et al. (2011) study, for example, did not blindly accept official Chinese government figures for Beijing's air pollution index (API) but compared these with high-quality aerosol optimal depth (AOD) data collected by NASA satellites. In addition, independent environmental monitoring by citizens, investigative journalists (e.g., the US-based Center for Public Integrity), environmental activists, and well-resourced NGOs is now commonplace. *Corporate Watch*, *Banktrack*, and *Carbon Underground 200* are but three of literally dozens of organizations that now forensically monitor and report upon the activities of corporate entities and nation-states. The last of these provides detailed and constantly updated information on the top 200 public companies that are investing in fossil fuel enterprises (www.fossilfreeindexes.com).

Two other non-state actor initiatives that are worthy of note are the online *Environmental Justice Atlas* (www.ejatlas.org) and *Pure Earth* (www.pureeart.org). The latter's mission is to "identify and clean up the poorest communities throughout the developing world where high concentrations of toxins have devastating health effects." Needless to add, the information gathered by such organizations and projects can now be transmitted around the world through social media platforms almost instantaneously. "Naming and shaming" is becoming an increasingly common feature of NGO environmental activism. In 2015, the oil multinational, Chevron, was a recipient of the *Lifetime Award* by a consortium of non-state agencies known as the "Public Eye on Davos" for its role in dumping toxic waste into the Amazon in Ecuador. Four years earlier – in a class action that had dragged on for almost a decade – Amazonian indigenous residents had been awarded USD 8.6 billion in the Ecuadorian courts in compensation for the environmental and health impacts of the company's operations. Invoking ISDS rights, Chevron has countersued.

## BHP Billiton, Adani, and the Polluter-Pays Principle

BHP Billiton has a similar history of textbook, environmental desecration in developing countries. Each year, between 1984 and 2013, for example, almost 100 million tonnes of untreated tailings from the company's Ok Tedi mine in western Papua New Guinea were discharged into the Fly River. The highly toxic contaminants killed valuable fish stocks, native forest, and food plantations over a 2000 $km^2$ area. The company was subsequently the target of an unprecedented global campaign on the part of environmental NGOs which – as in the Chevron/Ecuadorian case – eventually resulted in an out-of-court settlement to communities along the Fly River of almost USD 30 million. More recently – since November 2015 – the same company has again been embroiled in ongoing, legal action concerning its role in Brazil's most serious pollution event associated with mining activity. Two tailings dams collapsed at its joint venture, Samarco iron-ore mine, in southeastern Brazil on 5 November. The ensuing, massive mudslide killed 19 people and caused extensive damage in a downstream town, as well as seriously contaminating the Doce River and offshore waters in the Atlantic. At the time of writing, a class action against BHP Billiton and its partner Vale has been filed in the courts in New York on behalf of clients holding USD 2.2 billion in investments in banks that funded the doomed venture. Criminal

charges are also pending in Brazil against targeted corporate executives (Danchkert 2017).

At the time of writing, another mining giant – India's Adani corporation – is in negotiations with the Queensland and Australian governments over plans to open what would be by far Australia's largest coal-mining operation when fully operational. This is the proposed, AUD 22 billion, Carmichael mine in the Galilee Basin. The current plan is to access the estimated 2.3 billion tonnes of coal and transport it 400 km by rail to a new port on the Queensland coast whence it would be shipped to India. On the table is a $1 billion concessional loan from the Commonwealth government for the railway connection. Critics have slammed the mine proposal, arguing that granting the project the green light would make a mockery of Australia's commitment to reduce greenhouse gas emissions under the Paris Agreement (McKenzie et al. 2017). Concerns have also been raised about the impact of shipping and dredging on the adjacent Great Barrier Reef, already showing signs of serious deterioration as a result of climate change. However, a legal challenge to the granting of the mining lease on the part of environmental groups was overturned by the Queensland Supreme Court in 2016.

More recently, Environmental Justice Australia (2017) has released a detailed report of Adani's poor environmental law compliance record and illegal dealings overseas. These included a serious pollution offense 20 nautical miles off the coast of Mumbai in 2011 when an Adani-chartered coal vessel sank. The resulting pollution from 60,000MT of coal, as well as the ship's oil fuel, had a devastating impact on coastal ecosystems and commercial activities. Adani Enterprises took no responsibility for a cleanup and in August 2016 was fined AUD 975,000 by India's National Green Tribunal.

The BHP Billiton and Adani examples – widely separated in time and space yet sharing so many common characteristics – highlight the legal (and moral) complexity surrounding the definition of corporate and environmental "responsibility." The oft quoted "polluter-pays principle" for OECD countries makes it clear that the "mining entity" is always the one ultimately accountable for environmental damage and reparation (OECD 2001). Yet there are widely differing interpretations of "entity." Apart from the company director, does it also include shareholders and investment banks, for example? Adani's structure in Australia, for example, comprises 25 separate legal entities. And how, precisely, does one define "accountability" and assess "corporate responsibility?" (Johnson 2017). The latter may well entail the rights of future generations, plants and animals, and/or traditional spiritual connections to land and water. As well, complicating matters, in the Ok Tedi case, over time, there were numerous legal changes to details of the ownership structure and related responsibilities in the mining operation (Marychurch and Stoiannoff 2006). The PNG government assumed complete control of the mine in 2013. Its Parliament also repealed the legislation granting the right to sue BHP Billiton for the damage it had caused. That damage could last for hundreds of years, and mining still continues.

In stark contrast, New Zealand may well be setting a new international standard for such issues in the future. The *Te Urewera Act* (2014) and the soon to be legislated *Te Awa Tupua Bill* completely overturn the presumption of human sovereignty over the natural world and grant the powerful status of "legal personality" to rivers and their catchments. The wide diffusion of this entirely new legal construct around the world has the potential to seriously impact the environmentally and culturally damaging activities of global mining, agribusiness, and chemical companies in such places as South America and Canada.

## The Global Commission on Pollution and Health

The recently constituted, high-level, Global Commission on Pollution and Health (www.commissiononpollution.org) has as its aim the raising of global public awareness of the critical linkage between pollution and health and the surging health costs associated with pollution of all kinds. Its findings are due to be published in

*The Lancet* in 2017. It will be interesting to see if the Commission casts its net widely to include the abovementioned corporate activities, as well as the hugely under-researched, lasting environmental effects of over 500 atmospheric nuclear weapons' tests and armed conflicts around the world (Simon and Bouville 2015).

The latter is a key focus of the international Toxic Remnants of War Project (www.trwn.org). We have, for example, recently passed the 25th anniversary of the end of the first Gulf War. The deliberate ignition of over 700 Kuwaiti oil wells by Iraqi troops at that time created by far the most extensive oil spill ever recorded (1.5 billion barrels). The subsequent fires burnt for over 9 months and covered a 1000 $km^2$ area. Following the conflict, a United Nations Compensation Commission (UNCC) was hastily established to evaluate 170 so-called F4 claims from 12 states. These related to "environmental damage and depletion of natural resources." As a result of scientific uncertainty and evidentiary problems in apportioning cost and blame, a mere 6% of claims received compensation. The "Legacies of War" project, too, continues to highlight the ongoing problem of unexploded ordnance (UXO) in Laos, following the Vietnam War. That country has the distinction of being the most heavily bombed country in the world. The legacy is an estimated 75 million still unexploded bombs in 10 out of 18 of the provinces, resulting in one-third of the land area being classified as "severely contaminated" (www.legaciesofwar.org).

## "Natural" and "Unnatural" Contaminants

As would be clear by now, the umbrella term "pollution" is open to extremely wide interpretation. At one level it covers contaminants from both point and nonpoint sources and also encompasses a wide range of both naturally occurring and synthetic substances now routinely occurring (and persisting) in the soil, water, oceans, and the atmosphere, as well as energy in the form of heat and light. A complication is that many so-called contaminants do not pose a problem in small quantities; the damaging effects (as with asbestos) may take decades to make their mark, and that opinion is sharply divided on whether or not certain things should be classified as pollutants at all.

In industry circles, genetically engineered (GE or GM) crops and seeds, for example, are frequently heralded as "miracle" products promising to solve the problem of developing world malnutrition. For organic farmers the very same products are classed as pollutants with the capacity to cross-pollinate and seriously damage the legitimacy of their brand. GM maize (MON810) was first introduced into Spain in 1998 and has subsequently expanded rapidly in the northeast of the country, in particular. Because of the actual and potential contamination threat, the area sown to organic maize in Aragon fell dramatically by 75% between 2003 and 2007 (Herrero et al. 2017).

Some jurisdictions – most notably in many parts of Europe – have invoked the precautionary principle; a conscious decision has been made that we still do not have enough scientific evidence about the safety or possible harmful effects of GE crops and that, accordingly, they should either be disallowed altogether or subject to very strict controls and transparency about their field locations (Robin 2012). However, by a slender, five to four margin, in the high-profile Supreme Court of Canada case of *Monsanto Canada Inc. v Schmeiser* (2004), the court ruled that Monsanto had not accidentally "contaminated" Mr. Schmeiser's canola crop in Saskatchewan with its patented canola seed. This was a substantial victory for the principle of seed patenting by the chemical giant that, as we have seen, is currently in discussions with Bayer about a possible merger.

The case highlighted the absurdity of the "coexistence" model, the assumption that seeds could not routinely be transmitted over large distances by wind, and also challenged the fundamentals of the "patent rights versus property rights" debate. The *International Treaty on Plant Genetic Resources for Food and Agriculture* came into force in 2004 and currently has 139 contracting parties. The aim of the treaty is to guarantee farmer's rights and to recognize non-

patented seeds as the common property of mankind. The treaty has the potential to be one of the finest examples of collaborative global governance, but its weakness is that different countries have widely varying interpretations of the concept of "farmer's rights."

There is also a strong argument for including exotic plants, animals, and certain diseases (e.g., Ebola, foot and mouth disease) as "pollutants." Often – as with the introduction of rabbits and cane toads into Australia – this was carried out deliberately with the very best of intentions but without any real understanding of the untold ecological damage that would eventually unfold. But more commonly the plant and animal "invaders" make their way around the world in ship or air cargo and ballast water or are transported on the wind and by birds and ocean currents. If not quickly contained, the economic costs can be enormous. As a result, protectionism in the form of biosecurity is now an important concern for national governments everywhere though unfortunately states vary greatly in terms of their resources, openness to external scrutiny of threats, and commitment to action. To take one example of the damage that can be done, the cost estimate for dealing with exotic weeds that had already taken a strong hold in Australia in the 1990s was AUD 3.3 billion a year. This included lost production and eradication programs (Low 1999).

The serious BSE outbreak in the UK in 1986 and the SARS (severe acute respiratory syndrome) epidemic of 2002/2003 provide two other tragic cases of cross-contamination with widespread health and transboundary impacts. Bovine spongiform encephalopathy ("mad cow disease") first appeared in cattle eating contaminated feed. It also spread to humans and eventually caused 229 deaths in the UK and elsewhere. The subsequent eradication campaign involved the slaughter of 4.4 million cattle in the UK and a crippling 10-year ban on the import of British beef into the EU.

Like Ebola, and the earliest phase of HIV, SARS too is a zoonotic disease. In this case, it started in Guandong, southern China, in November 2002, when the SARS coronavirus was transmitted to humans via wild animals sold in local markets. Early failures of diagnosis, treatment, and notification to the World Health Organization on the part of the Chinese authorities meant that the disease quickly spread to Hong Kong, Taiwan, and elsewhere in China and then appeared in Toronto, Canada, in February of the following year. Largely through rapid transmission by air transport, an estimated 774 people in over 30 countries eventually succumbed to the disease before it was finally contained by a well-coordinated, though belated, global effort (Keil 2014).

## Persistent Organic Pollutants (POPS)

Clearly unanticipated at the time of their early deployment, many relatively recently developed toxic substances such as asbestos, the constituents of plastics, pesticides like dieldrin, the insecticide chlordane, and flame-retardant PCBs (polychlorinated biphenyls) stubbornly persist in the soil, oceans, atmosphere, and food chain for generations. The long-term impacts of the use of such products are truly global in scope. The herbicide 2,4-D/2,4,5-T ("Agent Orange"), used with such devastating effect by the US military in its "defoliation" campaign over some four million acres in Vietnam between 1965 and 1971, continues to this day to produce adverse health impacts (e.g., cancers, diabetes, and birth defects) among countless American veterans and Vietnamese civilians, as well as in populations of agricultural workers and rural communities, across both the so-called developed and developing worlds.

One of the components of "Agent Orange" was the highly toxic TCDD (or 2,3,7,8-*tetrachlorodibenzo para dioxin*) chemical. This is one of the dioxins that make up the "dirty dozen" group of so-called POPs or persistent organic pollutants. The insecticides aldrin, dieldrin, and DDT are also on the list. The latter was widely used by the US military during the Second World War as a defense against mosquito-transmitted malaria and dengue fever, but its serious health impacts were drawn to the public's attention by the publication of Rachel Carson's best-selling book, *Silent Spring*, in 1962. Subsequently it

was banned for most purposes in the United States in 1973. It continued to be used in the UK for another decade and is still widely used in India. This is despite the UN's Stockholm Convention on Persistent Organic Pollutants coming into force in 2004 in an attempt to stop the use and spread of POPs.

Dioxins are particularly dangerous by-products of many industries, including the production of pesticides and herbicides (widely used in industrial-scale agriculture), metal smelting, and paper bleaching. High-temperature incineration is the only effective method of dealing with these products that are often found in waste oil. But this an expensive exercise, well out of the reach of many poorer countries. Long-term storage in deteriorating containers, followed by leakage into the soil and waterways, is an all too common occurrence. PCBs were produced in large quantities (around 1.3 million tonnes) from the 1930s till the 1970s. By that time there was indisputable evidence of their harmful effects right through the food chain. Of this total approximately 35% is believed to be in or near the open oceans. A recent study found high concentrations of PCBs at depths of between 7000 and 10,000 m in Kermadec and Mariana trenches. It is thought that this may be related to the relative proximity to the North Pacific Subtropical Gyre, more commonly known as the "Great Pacific Garbage Patch" (Jamieson et al. 2017).

As global reserves of conventional oil rapidly approach exhaustion, the major multinational energy corporations such as ExxonMobil, Shell, and Statoil are diversifying into the exploitation of so-called unconventional oil deposits like shale oil and tar sands. Sometimes referred to as "extreme energy," for decades these were deemed to be too expensive and technically difficult to develop (www.extremenergy.org). They require enormous amounts of energy to extract and process, thereby adding considerably to carbon dioxide emissions and global warming. But in addition, hydraulic fracturing fluids and wastewater have been found to harbor scores of dangerous toxins (Elliott et al. 2017). These include benzene, arsenic, and mercury, the latter infamous for its link with Minamata disease, first identified in Japan in 1956. Minamata is contracted by eating contaminated seafood, and the victims are believed to number up to 200,000 so far. One positive outcome has been that – under the aegis of UNEP's Global Mercury Partnership – the Japanese government has taken on a strong global leadership role in terms of "mercury management" so that other countries can learn from the mistakes made over 60 years ago. A UN "Minamata Convention" is currently in the early stages of formulation (Ministry of the Environment, Japan 2013).

Evernden (1995: 525) reminds us that, broadly defined, pollution is by no means a modern phenomenon. Throughout history it has been seen by all societies to represent "the defilement of the purity or sanctity of something – but not necessarily only to the physical world." As such, polluting agents (e.g., countries, corporations) invariably are targeted as being "at fault" or – as in the contemporary field of "green criminology" – perpetrators of criminal acts (Lynch et al. 2016). Increasingly, for example, those judged to be responsible for marine oil spills (*Exxon Valdez* (1989); British Petroleum/*Deepwater Horizon* (2010)), the illegal trade in hazardous wastes from affluent to developing countries, or food contamination are the subject of legal prosecution. The latter was a major concern internationally in 2008 when milk, eggs, and infant formula products originating in China were found to have been deliberately adulterated with the chemical melamine by 22 companies. Some 12 countries eventually banned the import of dairy products from China, and subsequent trials in that country resulted in a number of lengthy prison terms and two executions of company officials.

## Waste

Pollution is often equated with "waste." This takes many different forms but is usually subdivided into "hazardous" and "nonhazardous" categories. It includes radioactive by-products (a form of *intractable* hazardous waste), decommissioned ships and military bases, food waste (to the tune of US$ 1 trillion a year), plastics and packaging,

mining tailings dams, used car tires, and the multiple subproducts of electronic goods. Comprising such items as used televisions, computers, and mobile phones, the latter (e-waste) was estimated to total 41.8 million metric tonnes in 2014. Involving a long and complex global chain of collection, transport, disassemblage, recycling, and resale, this is an industry estimated to be worth as much as USD 18.8 billion in 2014 (including a sizeable informal and illegal sector) and growing rapidly year by year (United Nations Environment Programme 2015). The United States, for example, discards up to 20 million personal computers annually, and, within a decade, predictions are for a sevenfold increase in mobile phone e-waste in China and more than double that figure for India (Olowu 2012). When broken down individual mobile phones yield small amounts of gold. Yet used electronic products also release large quantities of toxic by-products such as cadmium, arsenic, and mercury that can cause serious contamination problems at the point of end-of-life processing.

The legal and illegal trade in waste products of all kinds are now one of the fastest-growing items in global sea transport. The widespread uptake of containerization has made this possible. To a large extent, the trade is controlled by transnational crime syndicates, and under the terms of the 1992 *Basel Convention on the Control of Transboundary Movements of Hazardous Wastes*, "illegal activity" is defined as a crime. As waste recycling, disposal, and related regulatory costs continue to rise in Western Europe and North America, West African countries, like Ghana, Cote d'Ivoire, and Nigeria, as well as Vietnam, China, and Bangladesh in Asia, have become increasingly favored destinations for wastes of all kinds. Product separation and recovery are usually carried out at the small-scale, informal level with minimal health and environmental controls. As well, there is ample evidence of illegal dumping at sea as well as on land (United Nations Environment Programme 2015).

In the mid-1990s, Canada sought to stop the export of PCBs on environmental grounds. Invoking ISDS and the NAFTA framework, the US company SD Myers Inc. (SDMI) challenged this ruling in 1998, seeking USD 70 million in compensation. SDMI is a waste management processing company that had planned to access Canadian-based PCBs for its American operations. In 2000, the United Nations Commission on International Trade Law (UNCITRAL) found in favor of SDMI and ordered the Canadian government to pay CAD six million to the company.

Most of this discussion focuses on human actions that have – and continue to exert – an adverse impact on the atmospheric and marine commons. But it needs to be stressed that "pollution" can also be caused by "natural" phenomena. Major explosive volcanic eruptions and accompanying tsunami events are a clear case in point. The scientific consensus is that, over the long geological timescale, there have been five previous mass extinction events and that we are currently living through the sixth. While the present phase appears to be largely attributable to multiple, accelerating human impacts on a global scale, volcanic eruptions, wildfires, and associated environmental changes over relatively short geological time horizons are now widely accepted as having played a major role in the past (Hance 2015). In other words, as earthlings, our hold on this planet is, at best, tenuous (Eckersley 2014).

## "Natural" Pollution: Volcanic Eruptions

When the island of Krakatoa off the coast of Java was so spectacularly annihilated by catastrophic natural forces in August 1883, the resulting toxic volcanic ash cloud reached deep into the stratosphere, by some estimates as high as 160,000 ft. The explosion was heard thousands of kilometers away. Fine particulate matter and sulfur dioxide circled the earth for months, resulting in spectacular sunsets in Europe and North and South America and a worldwide drop in temperature. The ash was eventually widely distributed as acid rain. A forerunner to the far more destructive 2004 Indian Ocean tsunami, the accompanying tidal waves at that time led to the deaths of some 36,000 people and contaminated vital freshwater supplies in low-lying coastal areas, often on the other side of the Indian Ocean, far from the initial

eruption site. This particular volcanic episode, which was by no means the largest that the world has experienced, of course occurred in pre-aviation times. Winchester (2003: 271) notes, "Few in Victorian times had begun to think truly globally. . .Krakatoa, however, began to change all that."

More recently, the world has experienced two major volcanic episodes, the first at Mount Pinatubo in the Philippines in 1991 and the second in Iceland in 2010. In the twentieth century, only Novarupta in Alaska exceeded the force and level of particulate emissions of Pinatubo, which rivaled those of Krakatoa. A high-level, sulfuric acid haze was generated over a wide area of Southeast Asia and lasted for more than a year. Agricultural production was severely affected, and the major US military bases at Clark and Subic Bay were subsequently abandoned.

Further – in April 2010 – the widely dispersed ash cloud from the Eyjafjallajokull volcanic eruption in Iceland seriously disrupted airline flights for more than a week across Europe and beyond. Over 100,000 flights, involving around ten million passengers, were subsequently canceled for safety reasons (Bye 2011). Although large, the Eyjafjallajokull event pales into insignificance by comparison with the Laki eruption in the same part of Iceland 227 years earlier. Laki erupted continuously for 8 months and has been estimated to have been around 100 times larger than the 2010 event (Thordarson and Self 2003). At its peak the volcano was forcing 17 Mt. of sulfur dioxide into the atmosphere every 3 days. In the summer of 1783, some 20,000 people in Britain alone died as a result of sulfur dioxide poisoning directly linked to the eruption. One can only speculate about the health and climatic impacts as well as the scale of disruption to air traffic and economic activity were such an eruption to occur today.

## The Aviation Industry

Air transport can, in many ways, be seen as synonymous with globalization. As it has evolved, it has greatly assisted in the ever-accelerated movement of people, goods, ideas, innovations, and humanitarian aid around the world. These are the indisputable, positive aspects. But as we saw in the example of SARS, aviation also facilitates the rapid transmission of diseases and – of central significance to the present discussion – adds to the total atmospheric load of greenhouse gas pollution on a truly massive scale. As such, the aviation sector can also be viewed as being emblematic of the growth/pollution dilemma and has, for many years, been the target of increasingly strident criticism by environmental campaigners. Put simply, while traveling, aircraft emit extremely large quantities of greenhouse gases, including sulfur dioxide, nitrogen oxide, and hydrocarbons. For example, a return flight from Melbourne, Australia, to London generates approximately 17 t of CO2 per passenger, and it has been estimated that for the period up to 2050, global carbon emissions from air transport could total around 43 Gt (Paradee 2015). This would make the aviation sector the fastest growing contributor to global warming and would come about largely as a consequence of the exponential expansion of airports, aircraft, flights, and passenger numbers. The latter have been projected by IATA to increase from 3.8 billion passengers in 2016 to 7.2 billion in 2035.

Much of the new growth will come from Asia. But this is only a very small part of the picture. One also needs to build into the equation the pollution load created by building and maintaining the aircraft and airports, extracting and transporting the fuel and passengers to and from airports, and so on. When combined, this could lead to the sector eventually contributing as much as 15% of greenhouse gases from all sources. Specifying national contributions to such a globalized industry is immensely challenging and so far has defied all attempts at building a robust global governance framework. Nevertheless, Austria represents an interesting development in this regard. In February 2017, that country's Federal Administrative Court ruled against a proposal to build a third runway at Vienna Airport on the grounds that this would contravene Austria's international commitment to reduce the quantum of its greenhouse gas

emissions (The Local/AFP 2017). A similar fight by environmental and resident's action groups against plans to increase the capacity of London's Heathrow Airport was lost the previous year.

## Concluding Remarks

The examples of airport expansion plans at Vienna and London highlight a fundamental conundrum at the heart of this chapter. While Austria, at least for the time being, has taken a bold symbolic stand in favor of reducing greenhouse gas emissions and setting an international example, the UK – as noted – has given the go-ahead for Heathrow to greatly increase its capacity and thus contribute to the already rapidly rising quantum of emissions from the aviation sector around the world. In China, Beijing's latest international airport has seven runways, and the country plans to build 66 new airports over the next 5 years. In short, Austria's laudable actions will have minimal impact on climate change. Given that there is no such entity as a "'World State," the core issue here, of course, in common with so many of the topics covered, is the absence of *enforcement* mechanisms.

The sanction of "naming and shaming" was discussed briefly, above. Barrett (2016: 14519) has recently focused on the potential power of this in the Paris Agreement on climate change, arguing that the real innovation in this treaty "is to embed voluntary contribution making within a framework of 'pledge and review.'" In other words, nation-states set transparent targets to commit to reducing carbon emissions which are then available for all to assess. However, the pledges made relate to the years 2025 and 2030, and there is considerable uncertainty surrounding the effectiveness of naming and shaming to bring about substantive behavioral change.

There are currently approximately 200 nation-states and a similar number of largely voluntary environmental treaties and conventions with limited sanctions attached. There are also "failed"/"fragile" states (approximately 65), as well as many experiencing ongoing armed conflicts. Illegal trade of all kinds is a common feature of these situations and includes toxic waste, banned pesticides, and radioactive material. We also need to add into this mix a weakening of environmental laws and regulations by new administrations in such countries as Canada and the United States. Finally, as we have seen, the world has a relatively small number of immensely wealthy and powerful transnational corporations whose activities are not constrained to any degree by national borders (Hertz 2001). In short, the prospects for effective global governance to resolve past and emerging pollution-related matters are not encouraging. Close scrutiny of all the key environmental indicators gives little cause for optimism.

# Globalization and Predatory Corporations

Judith Bessant and Rob Watts
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

Mainstream criminologists and many social scientists have little trouble talking about certain criminals as "super-predators" when referring to what comes to people's mind thinking about "crime," that is, working-class crime. Conventional criminologists have long complained how America has become home to "thickening ranks of juvenile 'super-predators' – radically impulsive, brutally remorseless youngsters, including ever more pre-teenage boys, who murder, assault, rape, rob, burglarize. . .." (Bennett et al. 1996: 27).

However any comparative assessment of harm reveals that the modern super-predators who cause the greatest harm are major well-known corporations, many working globally who deal out theft, physical violence, destruction, and death on a scale that makes blue-collar crime in comparison shrink to near invisibility. In 2000, e.g., the FBI's Uniform Crime Report identified some 407,842 robberies in the USA netting $US477 million or an average of $US1,170 per robbery. In 2000, one broker employed by Drexel Werner Lambert agreed to repay $600 m as part of a successful plea bargain in respect of 90 criminal charges for his insider trading, the creation of dummy companies, and secret offshore operations that netted him hundreds of millions of dollars. In the same year, major banks and investment houses (including Morgan Stanley, Goldman Sachs, Citigroup, Bear Sterns, Sun Life, UBS, and Bank of America) were fined or ordered to repay to clients over $US4.5 billion by the US Securities and Exchange Commission for a rich variety of fraudulent and predatory behavior (Forbes 2004).

## Corporations and Predatory Behavior

One difficulty when confronted by predatory corporate behavior is that understanding it requires acknowledging an array of conduct. It includes economic crimes like fraud, corrupt investment practices, selling dangerous products, bribery, and embezzlement, all of which have major economic consequences. Apart from such economic crimes, it includes tax evasion and corruption which deprive the community of public funding for education, health, and other essential services. Added to this are exploitative labor practices, forced labor, human trafficking and aiding and abetting sexual and other forms of violence, and the spread of drug abuse (Zerk 2012). It includes the systematic use of violence and terror by security companies generating major human rights abuses. It includes serious and sustained environmental or "Green crime" including toxic waste dumping (linked to negative impacts on health or water) and pollution of air, land, or water all of which impair people's rights to work, water, or health (Brisman et al. 2014; White 2014). Plus there is an array of economic sanctions violations which enable corporate actors to profit from human rights abuses, extortion (by abusive armed groups who control mine sites), and handling of stolen goods (Amnesty International and the International Corporate Accountability Roundtable 2014).

Another aspect of predatory corporate behavior which further frustrates research and prosecution is its legal invisibility, a feature linked to the impunity with which much predatory behavior by corporates is carried out. In effect, defining predatory corporate behavior requires acknowledging that when corporate entities or individuals, acting on behalf of a corporate, commit or are complicit in the commission of predatory and criminal conduct, they do so with impunity and little, if any, accountability. The failure or refusal of states to investigate let alone prosecute predatory activity makes assessing or researching its incidence even harder than is the case for ordinary crime where the problem (the "dark figure of crime") continues

to haunt criminology (Coleman and Moynihan 1996).

A related difficulty, developed later in this chapter, is how the category of corporate crime threatens to dissolve conventional understandings of the clear boundaries between "criminal conduct" and "normal" business behavior. Predatory corporate behavior erodes the belief that normal businesses including the business of governments is always law-abiding and would never include predatory or illegal conduct. As we see, recent moves to theorize parapolitics (e.g., Wilson 2009, 2015) explicitly acknowledge some of the conceptual errors this conceptual distinction relies on and perpetuates.

The tendency of markets to encourage predatory behavior was well captured in Akerlof's (1970) article about "lemons markets" in which he identified the regular use of deception and fraud in the economics literature. The frauds were possible because information was asymmetrical. The seller knew more about the true quality of the goods than the buyer, and the seller exploited that information advantage by misrepresenting the goods. Akerlof showed that this could produce supranormal profits for fraudulent sellers making it impossible for reputable sellers to compete. Over time, the normal well-functioning market would come to be dominated by fraudulent sellers of poor quality, even dangerous goods.

## Origins of Concept of Predatory Behavior

In related fashion, predatory crime by corporates has long been largely invisible in mainstream disciplines like criminology, political science, or economics. The significance of this can be recognized by considering Garland's (2009: 118) observation that "criminology's object [i.e., crime] is not a self-generated theoretical entity or a naturally-occurring phenomenon, but instead a state-defined social problem." This raises questions about the authorizing grounds which any of social scientific project investigating corporate crime relies on. This refers to the fact that most criminologists, economists, and political scientists define crime in terms paralleling whatever their governments define as criminal. Bourdieu highlighted the dangers of this practice:

> . . . one of the major powers of the state is to produce and impose . . .categories of thought that we spontaneously apply to all things of the social world – including the state itself. (1998: 35)

This points to the risks in trying to think about matters like predatory because we face the danger of applying "categories of thought produced and guaranteed by the state" (Bourdieu 1998: 35).

This is not to deny that many writers struggle against this problem. Veblen, e.g., highlighted how a predatory financial system organized monopolies and protected its major customers while adding to costs, making economies less competitive and denying workers and citizens the fruits of technological progress (1904). In the USA, Veblen's work was part of a movement of liberal reform from 1900.

Sutherland who coined the term "white-collar crime" went further, emphasizing the criminal conduct of "normal" business practices. He analyzed 70 of America's largest nonfinancial corporations including 15 public utilities (i.e., electric generation corporations) (1940). Sutherland identified systematic evidence of price-fixing; manipulation of patents, trademarks, and copyrights; misrepresentation in advertising; and unfair labor practices by these corporations. Sutherland described 44 cases in which state and federal laws were violated by public utilities and pointed out that despite widespread violations of laws, few if any of the utility corporations had been successfully prosecuted.

It would take many more decades before some social scientists agreed that "white-collar crime" was predatory crime and a greater problem than street-level crime. Even so predatory corporate behavior has been the work academics like Korten (1998, 2001), Falk (1999), and Galbraith (2006). Others asked how to strengthen legal and regulatory frameworks: Hadden et al. (2014) argue that if decades of neoliberal reform of company law and practice enabled the resurgence of predatory corporations, then new kinds of legislation and regulation are needed to prevent abuses in the corporate sector.

However even by the time like Wheeler and Rothman's (1982) studies of the corporation as a "weapon" and "shield" and Blumberg's (1989a, b) account of corporate predatory behavior in white-collar crime appeared, globalization processes were increasing the scale and scope of corporate predation providing new challenges to the social sciences to understand the growing array of corporate malfeasance taking place globally.

## Globalizing Corporate Predatory Conduct

The processes of globalization have increased the scale and scope of predatory corporations. If predatory company behavior was problematic when it was largely confined to one nation-state, its global spread expanded the problem. There are many ways in which globalization processes facilitated this. There are four key factors.

First the "financialization" in developed economies, like the USA, Europe, and more recently China, created new markets in which financial predation became the norm by the 2000s. Financialization refers to the way banks and investment corporations deliberately promoted the use of debt especially by low-income households and the increasing buying and selling of non-asset-based financial products which constitute the derivatives market (Mason 2015). It is a market based on future contracts and various speculative insurance products (like Credit Default Swaps) set against low-income families' mortgages, interest rates, foreign currencies, treasury bonds, and the like. In the USA, the derivative market was "worth" $1200 trillion in 2006 or nearly ten times the total values of US GDP in 2006 ($US12,456 trillion) (Bank of International Settlement 2007).

"Financialization" came to denominate the development of financial capitalism especially since the 1970s. As Epstein notes:

> . . .financialization refers to the increasing importance of financial markets, financial motives, financial institutions, and financial elites in the operation of the economy and its governing institutions, both at the national and international levels. (2002: 1)

This is evident in the dominance of financial transactions and financial products which account for an increasing share of national income relative to other sectors and/or to the flow of global finance. Krippner (2005) argues that there has been a shift from the production of real things to a "pattern of accumulation in which profit-making occurs increasingly through financial channels rather than through trade and commodity production". Evidence supporting this description is clear. Trading in US equity (stock) markets grew from $136.0 billion (or 13.1% of US GDP) in 1970 to $1.671 trillion (or 28.8% of US GDP) in 1990. A decade later, trading in US equity markets was $14.222 trillion (or 144.9% of US GDP).

Secondly, financialization mirrored the general movement of corporations becoming *transnational corporations* (TNCs). The evolution of *transnational corporations* saw large companies recognize the strategic value of moving into the spaces between nation-states thereby reducing state regulation of labor practices, tax liabilities, health and safety requirements, or product standards (O'Brien and Williams 2010).

In this respect, the globalization of predatory corporate behavior involved constant efforts to escape bids by states to regulate predatory behavior within nation-states. In particular globalization of finance has been accompanied by the centralization of control in the hands of a very few companies. As Vitali et al. (2011) revealed in research analyzing a database of 37 million companies and investors worldwide, all 43,060 transnational corporations shared ownerships that linked them. Their work revealed a core of 1318 transnational companies with interlocking ownerships. Each of the 1318 had ties to two or more other companies and on average was connected to 20. Although they represented 20% of global operating revenues, the 1318 collectively owned through shares the majority of the world's large blue chip and manufacturing firms – the so-called "real" economy – representing a further 60% of global revenues.

Central to this network of global control was a "super-entity" consisting of 147 companies; "all of their ownership was held by other members of the super-entity that controlled 40% of the total

wealth in the network. In effect, less than 1% of the companies were able to control 40% of the entire network" (Coghlan and MacKenzie 2011). Most of these entities were financial institutions including Barclays Bank, JPMorgan Chase & Co, and The Goldman Sachs Group.

As will become clear, this network is the center of the global predatory financial network that caused the 2008 Great Recession.

Thirdly the growth of global digital networks helped promote globalization and predatory behavior. The predatory buying and selling of derivatives central to financialization after 1998 and which triggered the 2008 Great Recession was enhanced by the use of algorithms and Net-based trading (Pasquale 2015: 101–139). Some like Mason argue that the shift to nontraditional Net-based business models like Wikipedia or Uber points to new possibilities of a postcapitalist order (2015). Others like Chamayou (2014) point to the possibility of extended forms of predatory behavior enabled by the networked surveillance of all citizens.

Finally the spread of a globalized preoccupation with security triggered by 9/11 and the American-led "war in terror" helped augment predatory behavior involving theft, militarized violence by transnational security companies (Watts 2016: 226–228). In each case, the role of states is evident. Globalization itself is inconceivable without the state: globalized predatory corporate behavior likewise have depended on long-standing "parapolitical" or "deep political" shadowy networks of overlapping connections between companies, state agencies, and organized crime (Scott 2008; Wilson 2015). As companies saw the benefits in moving offshore from their headquarters in a given nation-state, predatory behavior became easier. As any adequate account of globalization reveals, without state interventions, globalization and globalized predatory corporate behavior of the kind we now have would not be possible.

While it would be difficult to arrive at an accurate account of the human, economic, political, or environmental costs of globalized predatory business practices, a sense of its scale is evident in the following:

- In the USA, the antitrust Sherman Act saw 36 big global companies (including JP Morgan, British Air, Samsung, Bridgestone, Mitsubishi, Royal Bank of Scotland, and Hoffmann-La Roche) fined $US8,048 billion between 1998 and 2017 for global conspiracy, price-fixing, or fraudulent currency deals.
- In the UK, corporate fraud costs the UK economy £73 billion a year (Home Office 2012: 8).
- By 2015, American and global banks had paid more than $200 billion in fines for "questionable behavior." In 2014, British banks like Barclays, HSBC, and Royal Bank of Scotland paid nearly $1 billion in fines related to foreign exchange improprieties. Goldman Sachs and BNP Paribas also got hit with combined fines approaching $250 million in related cases.
- Major global pharmaceutical companies have been fined nearly $US14 billion for falsifying clinical trials or selling and distributing drugs that either had no medical value or led to death and injury. Over a 25-year period, GlaxoSmithKline paid $US7.9 billion, and Pfizer paid $US3.9 billion in fines. In 2004, alone Pfizer paid a $430 million settlement for its misleading claims about of the seizure drug Neurontin; Merck's was fined $US950 million for marketing Vioxx.

Such a list however only hints the scale of such practices which have become larger due to globalizing processes. The evolution of publicly listed companies into transnational entities increased the scale of predation due to their commitment to create black and gray legal holes between national legal frameworks.

One end of the predation spectrum can be described and explained as a failure to regulate. Understood in this limited way involves anti-competitive behavior, labor exploitation, production of dangerous goods, tax evasion or avoidance, and environmental harm. In what follows we consider some of these.

## Corporate Fraud

Fraud comes in various forms. Sometimes as with the American energy company Enron and a major TNC, it was sophisticated. In 2001, Enron

admitted its reported financial condition was sustained by institutionalized, systematic, and creatively planned accounting fraud involving the global accountancy firm Arthur Andersen. Taking advantage of deregulation in the US energy sector in the 1990s, Enron fraudulently conspired with the other large electrical energy trading companies and devised a deceitful scheme to take electrical generating capacity off-line during times of high usage thereby creating artificial capacity overloads in electrical transmission. The fraud caused huge increases in electrical energy costs in California, bankrupted two major utilities, and caused several blackouts (FERC 2003). It also produced real profits for the conspirators until 2001.

Montréal-born David Walsh founded a group of companies Bre-X Minerals in 1989 and declared personal bankruptcy in 1992, avoiding the payment of C$40,000 in debts. In 1993, he bought the Indonesian "Busang" gold mining site. Walsh's Philippine mine manager believed at the time the site contained two million ounces of gold. These estimations kept rising over the years, from 2 to 30 in 1995, to 60 in 1996, and to 70 million ounces in 1997, pushing Bre-X's market value to $US6 billion dollars. Companies fought to become partners with Bre-X, including Barrick Gold (US$1.2 billion in revenues in 1997) and Freeport-McMoRan Copper and Gold (US$2.2 billion in 2003). However, in 1997, Freeport found out, after performing technical analyses, that the core Busang samples had been salted with gold. This turned into the largest scandal in Canadian history and the largest mining fraud of all time. Billions of dollars were lost. Walsh stole US$25 million prior to the announcement, and his associate, John Felderhof, US$84 million. Among the victims were the Ontario Municipal Employees Retirement Board (loss of $US45m).

Bernie Madoff used a Ponzi scheme model from the late 1960s to thieve from investors. The Madoff investment scandal was a major case of stock and securities fraud discovered in late 2008 when his investment house crashed owing more than $US50 billion. Madoff founded the firm Bernard L. Madoff Investment Securities LLC in 1960, and by 2008, it was the sixth-largest investment house on Wall Street. He remained its chairman until his arrest in 2008 soon after he pleaded guilty to 11 federal crimes and admitted to operating the largest private Ponzi scheme in history. It was a Ponzi fraud that worked like most investment scams of this kind: an individual or organization pays returns to its investors from new capital paid to the operators by new investors, rather than from profit earned through legitimate sources. The scheme requires a continual stream of investment to fund higher returns; once investment slows, the scheme collapses as the promoter has problems paying the promised returns (the higher the returns, the greater the risk of the scheme collapsing). On June 29, 2009, Madoff was sentenced to 150 years in prison with restitution of $170 billion.

G

### Exploitation of Labor

To maximize profits by reducing their labor costs, major transnational corporations exploit workers by cheating on wages and pension funds. In 2016, it was reported that Australian workers in popular retail and fast-food outlets, including major TNCs like Hungry Jack's, McDonald's, and KFC, were underpaid more than $300 million a year in 2016. The international chain of convenience stores 7-Eleven that operates franchises and licenses around 56,600 stores in 18 countries was paying many of its mostly young precariously employed workers in Australia as little as $10 an hour before tax, with the company's own figures suggesting up to two-thirds of its stores were underpaying their workers. In Australia in 2016, about a third of Australian workers were also being swindled by rogue employers including major TNCs who were holding back some or all of their pension fund entitlements. The Australian Tax Office raised $670 million by issuing nearly 3000 default assessments to employers as a result of reports from employees, totaling approximately $171 million.

### Tax Avoidance

The case of the American technology company Apple is a well-known example of a TNC engaging in tax avoidance on a massive scale. Apple was estimated at a market cap of $US572 billion.

In the UK, e.g., Apple earned £10.5 billion in revenue from sales in the UK but paid £11.4 million in tax. In 2016, EU antitrust regulators ordered Apple to pay up to 13 billion euros ($A19.15 billion) in back taxes to the Irish government after ruling that a special scheme to route profits through Ireland was illegal.

In Australia out of 1539 of the largest corporate entities 985 of which are foreign owned and 554 Australian owned, 40% did not pay any tax in 2013–2014. The 1539 companies had a combined turnover of $1.6 trillion in turnover and $169.9 billion in profit and paid a combined $39.9 billion in tax. There were 579 local- and foreign-based companies that paid no tax in 2013–2014 which had a combined turnover of $405.9 billion and a taxable income of $4 billion. The nil tax effect is either because they did not pay any tax, had offsets against profits that reduced their tax to zero, or made a loss, which the Tax Office reports as nil (ATO 2015). In 2015, what has come to be known as "the Panama Papers" revealed how shadow economies of government leaders, businesses, and many other rich and powerful hide money in offshore jurisdictions – tax havens – to evade tax, facilitate bribes and embezzlement, and commit various other crime (Obermayer and Obermaier 2016).

### Making and Selling Dangerous, Harmful Products

In 2015, Volkswagen which is Europe's biggest carmaker admitted that 11 million of its vehicles were fitted with software capable of cheating emissions tests, including five million at its namesake VW brand, 2.1 million at luxury brand Audi, 1.2 million at Czech division Skoda, and 1.8 million light commercial vehicles. VW also admitted cheating in diesel emissions tests in the USA. Volkswagen has announced plans to refit up to 11 million vehicles and overhaul its namesake brand to try to move on from the scandal over its cheating on diesel emissions tests. The German carmaker began recalling 11 million cars for customers to have diesel vehicles that contained illegal software refitted, a move which some analysts said could cost more than $6.5 billion euros ($10.4 billion) (Ewing 2015).

In September 2016, Samsung, the world's largest information technology company, was forced to recall 2.5 million units of its oversized Galaxy Note 7 mobile phone. The batteries, which were exploding, were too large to fit into their casing. Replacement batteries had poor welds, which also caused phones to explode. Samsung's revenue in 2014 of $US305 billion was equal to 30% of South Korea's $1082 billion GDP. The global recall cost the South Korean company $5.3 billion (£4.2 billion) in lost profits (Chen and Sang-Hun 2016).

### Environmental Destruction

To maximize profits, predatory transnational companies that cause tremendous environmental damage always seek to avoid all environmental restraints. There are many cases of massive destruction around the globe. One small example is the Bayou Corne Sinkhole in Louisiana created when an underground salt dome cavern operated by Texas Brine Company and owned by Occidental Petroleum collapsed (Hochschild 2016). In June 2012, residents of Bayou Corne began noticing the ground was shaking and bubbles began to arise from the water. When the sinkhole first appeared, it spanned a hectare (or 2.5 acres). By late 2016, the sinkhole covered 35 acres. Three hundred fifty residents were evacuated, and methane gas seeped out creating a permanent threat of an explosion. The Oxy3 mining operation, owned by Occidental Petroleum, was over a mile below the surface and was less than 100 ft. from the nearest oil and gas storage dome. Salt mining had been going on in Louisiana since the nineteenth century. Occidental Petroleum Corporation (Oxy) is a transnational oil and gas exploration and production company with operations in the USA, the Middle East, and Latin America. Headquartered in Houston Texas, it is one of the largest US oil and gas companies based on 2015 market capitalization. Texas Brine has been held responsible although a class action against the company had not been resolved by late 2016.

### Financial Predation

Nothing speaks to the rise of predatory finance than the growth of the global derivatives market.

What began with predatory mortgages given to high-risk low-income home buyers ended in the 2008 recession as creditors called in derivative worth more than $US5 trillion. The devastating effects of financial predation were encapsulated when the lives of hundreds of millions of people around the world were affected by the collapse of the derivatives market in 2008 leading to global mass unemployment, poverty, and the imposition of austerity policies (Hellwig 2009; Rajan 2010).

Derivatives were created after the 1970s to manage risk and create insurance against inflation resulting from the 1974 oil shock and a 50% drop in the value of US stock market. The first derivatives included options. The dramatic growth in derivative contracts occurred after 1999 when the Glass-Steagall Act 1933 was repealed, which allowed banks to operate as brokerage houses, and the growth of derivatives exploded in 1999. Among the key derivatives were *credit default swaps*, which protect against a counterparty defaulting, and *collateralized debt obligations* which was a kind of insurance in case people who had taken out loans with underlying collateral (like housing mortgages) are pooled. Credit default swaps are not standard financial instruments and have always been traded in unregulated markets, i.e., over the counter, involving transactions between buyers and sellers rather than through a regulated exchange.

In the period preceding the financial crisis of 2008, the advantageous leverage and convenience of credit default swaps and *collateralized debt obligations* fueled high-risk speculation. The process began when predatory mortgage companies persuaded low-income earners to borrow money using variable credit interest loans. The issuers of credit default swaps were almost certainly beguiled by the utopian view (supported by ill-considered mathematical algorithms) that housing prices would always go up.

Dealers on the buy and sell sides rushed to issue and purchase credit default swaps and *collateralized debt obligations* written on debt they did not even own. In 1999, the value of derivative held by banks was $US33 trillion, and other institutions held $US34 trillion. By 2008, this blew out to $US212 trillion held by banks and $US293 trillion held by entities like Lehman Brothers. By October 2008, the notional value of the unregulated over-the-counter market was estimated to be in excess of $ 600 trillion.

Others worked out quickly how to make huge profits from buying and selling derivatives. In spite of the lessons that ought to have been learned after the 2008 crash, the estimated total value of the derivatives market was still around $US493 trillion between end-June 2015 and end-December 2015 (Bank for International Settlements).

G

## Corporate Predation and Parapolitics

Globalization and corporate predatory behavior entails the imbrication of states, corporations large and small, and criminal networks. This becomes evident by paying attention to parapolitical theory which enables a new account of predatory corporates. The term "parapolitics" was first used by Iyer (1979) to question the conventional ways politics was understood. According to Iyer, parapolitics involves continually rethinking the foundations and frontiers of political principles, systems, and issues. It transcends conventional politics while still being reflected in it. Proponents of parapolitics appreciate the distinction between acts of the state that are public and open to direct investigation and those that are concealed, secret, and on occasion conspiratorial such as Watergate (1971–1974), the Iran-Contra scandal (1984), or NSA surveillance of vast numbers of US citizens (2004–2016) and non-American citizens where the executive in this case the POTUS knowingly engages in activity it knows to be illegal. For Scott parapolitics or what he calls "deep politics" involves:

(i) A system or practice of politics in which accountability is consciously diminished
(ii) Patterns of covert politics and the conduct of public affairs not by rational debate and responsible decision-making but by indirection, collusion, and deceit
(iii) The political exploitation of irresponsible agencies or parastructures, such as intelligence agencies (1972: 137).

As Scott explained, a deep political system or process habitually resorts to decision-making and enforcement procedures outside and inside those publicly sanctioned by law and society. Collusive secrecy and lawbreaking are part of how the "deep political" system works. "What makes these supplementary procedures 'deep' is the fact that they are covert or suppressed, outside general awareness as well as outside acknowledged political processes" (Scott 1996: xi–xiii). These "indeterminacies" multiply when looking at the deep political economy of contemporary transnational corporations. "Corporations, like mobsters, find it profitable to corrupt those who are supposed to keep their behavior within legal limits" (Scott 1996 xiii). Scott argues for going "beneath public formulations of policy issues to the bureaucratic, economic, and ultimately covert and criminal activities that underlie them" (1996: 10). Such deep political analysis presupposes "an open system with divergent power centers and goals" (Scott 1996: xi).

One example was the collapse of the Italian Republic in the mid-1990s due to large-scale criminal influence in government (Stille 1995). Another is the history of CIA and US government collusion in managing the global heroin trade. McCoy, Read and Adams documented CIA complicity and aid to the SE Asian opium/heroin trade (1972). The thesis of their book was that most of the world's heroin was produced in the "Golden Triangle." The heroin was transported in the planes, vehicles, and other conveyances supplied by the USA through Air America an airline covertly owned and operated by the CIA, which was used to transport the illicit drugs. As McCoy makes documents unlike the French national intelligence agencies, the CIA did not dabble in the drug traffic to finance its clandestine operations. Nor was its culpability, the work of a few corrupt agents, eager to share in the enormous profits. The CIA's role in the heroin traffic was a part of its cold war tactics (ibid., McCoy 2003).

Similarly the "war on terror" and the invasion of Iraq in 2003 by US-led forces sponsored a cascade of predatory conduct committed by American military personnel, civilian administrators, and security companies (like Blackwater) and mercenaries (Risen 2006). The Bush Administration employed mercenaries like *Blackwater* in Iraq, in clear contravention of the *International Convention against the Recruitment, Use, Financing and Training of Mercenaries 44/34* (Whyte 2003; Haas 2008). As Hartung (2003) argued, the complex interdependency of state and corporate entities saw corruption flourish, enabling the misappropriation and theft of $US20 billion and billions of dollars lost in webs of corrupt dealings (Risen 2014).

The invasion also triggered catastrophic levels of violence and death. The post-invasion "reconstruction" project itself turned into a cycle of armed insurgencies generating a humanitarian crisis on a staggering scale involving a significant civilian death rate in excess of 160,000 and a major refugee crisis (Whyte 2009: 134). Haas (2000) identified a list of war crimes committed in Iraq, while White (2008) made a strong case for treating the use of "depleted uranium" weapons by US forces in Iraq as a war crime. In 2004, images documenting torture and other abuses of Iraqi prisoners at Abu Ghraib prison by coalition forces presaged the discovery of other documented cases of abuses at American prisons throughout Iraq (Roth 2005).

## Conclusion

As we argued, the processes integral to globalization have enabled dramatic increases in the spread, scale, and reach of predatory corporate conduct. The normality of globalization and predatory corporate behavior is the reason why it will be difficult to bring the problem of corporate criminality under control and why this needs to become a major focus of international political and legal intervention.

## Globalization and Prostitution

Caroline Norma
Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

### Synonyms

Forced labor; Migration for sex work; Sex work

### Nineteenth-Century Globalized Prostitution

Both the nineteenth- and twentieth-century iterations of global capitalist consolidation brought widespread cross border sexual trading of women and girls and to a lesser extent boys. The nineteenth-century trade took four historically recognizable forms: (1) the transport of women into and within prostitution markets in colonial jurisdictions, such as European women shipped to South American colonies (Guy 1991) and Nigerian women taken to the Gold Coast (Aderinto 2015); (2) the shipping of women abroad for the purpose of venture capital raising, as in the case of Japanese women transported to Southeast Asia (Shimizu 1997); and (3) the trading of women by entrepreneurs taking advantage of commercial and military hubs established by their countrymen abroad, such as Chinese women taken to the USA (Hirata 1979) and Japanese women transported to occupied Manchuria (Howell 2004). Fourthly, legalized prostitution districts in countries like France and Belgium meant there was significant transport of women out of, for example, England, because of profits to be made in state-regulated jurisdictions (Machen 2011). Overall, the nineteenth-century sexual trading of women and girls did not reach the scale of that of the twentieth century, but its structural features are today recognizable in terms of trafficking, and its number of victims was significant, as summarized by Rachael Attwood (2015):

> By the 1890s, in line with mass migration from Europe following the Long Depression and the increasing persecution of Jews in and beyond the Pale of Settlement, a series of global trafficking networks was established that would flourish over subsequent decades. Hundreds of women were systematically transported from Continental, and particularly Eastern Europe, to destinations such as Johannesburg, Alexandria, Calcutta and Buenos Aires, and subjected to prolonged sexual exploitation in a lucrative multi-ethnic and multi-denominational trafficking industry. (p. 330)

The nineteenth-century trade at the time was significant enough to be recognized as a humanitarian emergency. From the late 1800s, it came to be condemned in terms similar to those evoked for the Atlantic African slave trade by so-called social reformers, including women's and child welfare groups, Jewish groups, Quakers, and Christians. Socialistic thought was influential among them; in 1848 the *Manifesto of the Communist Party* had called for the "abolition of the community of women springing from . . . prostitution both public and private." Humanitarian mobilization

against the trade began in Britain and extended to Europe and eventually reached as far as Japan (Shibahara 2014). This activism is historically well known in the transnational campaigning of Josephine Butler. After founding the International Abolitionist Federation in 1875, and before her death in 1906, Butler achieved extraordinary success in mobilizing women in a number of different European countries against prostitution who she then worked with in the League of Nations to enact a treaty against the international traffic. Sheila Jeffreys (2009) describes this history broadly as:

> a successful international campaign by women's groups and others against state regulation of prostitution from the late 19th century onwards. . .[that] intensified through the League of Nations committee on trafficking in persons between the two world wars and culminated in the 1949 Convention on Trafficking in Persons and Exploitation of the Prostitution of Others. (p. 2)

The groups and individuals who influenced the League of Nations and its drafting of treaties preceding the 1949 Convention understood trafficking as a trade in women and girls for prostitution. This coalition sought, as Magaly Rodríguez García (2012) writes, to "perfect. . .a 'global prohibition regime' against international sex trafficking and the direct or indirect recruitment for prostitution that endures to this day" (p. 98). Rodriguez Garcia explains that, after much discussion, they fixed upon the word "trafficking" to refer to the international sex trade in order that the fullest possible range of its proponents – including pimps, brokers, touts, and procurers, to be collectively referred to as "traffickers" – might be captured in measures against it. Members were anxious their work reach as far as possible into the business of prostitution to effectively combat trafficking. To this end, via the League of Nations Anti-trafficking Committee, they "insisted on the necessity of obtaining detailed information about national legal systems with regard to commercial sex and about the prostitution milieu in general" (p. 105). Subsequent international fact-finding missions led to the drafting of treaty provisions that reflected remarkable knowledge of the workings of the global sex trade. By 1927, Committee members saw trafficking as including:

> direct or indirect procuration of one or more other persons [for prostitution]. . .[and] the cases in which girls have been procured and transported to become mistresses of wealthy men. . .also. . .certain cases of the procuring of women as entertainers and artists, and exploiting them for the purposes of prostitution in foreign countries. . .. (Rodríguez García 2012, p. 107)

Campaigners understood their work in the League of Nations as supplementing that previously done toward the 1926 Slavery Convention. As Carole Moschetti (2005) explains, one influential campaigner, Nina Boyle, "criticised the framers of the [slavery] Convention and Governments they represented for constructing the definition of 'Slavery' in such a way that enabled the exclusion of forms of sexual slavery mostly affecting women and girls such as trafficking, prostitution and child marriage" (p. 136). According to Boyle, "[w]omen, unless they were wage earners, were virtually excluded from the definition." She objected that, by couching the definition of slavery in such terms as "none may own nor dispose of the person of a man, and more particularly the person of a wage-earner," the Convention effectively allowed that "the person of a woman may be lawfully and properly owed and disposed of so long as she be not a recognised wage-earner" (Moschetti 2005, p. 136). Anti-trafficking campaigning in the nineteenth century therefore functioned essentially as a gendered antislavery movement.

## Twentieth-Century Globalized Prostitution

This history of the nineteenth-century traffic and the campaigning it provoked sheds light on the subsequent twentieth-century trade and its contemporary political response. As a bridge to that past, the 1949 Convention still holds today, and so the United Nations formally condemns, for example, anyone who "Procures, entices or leads away, for purposes of prostitution, another person, even with the consent of that person," "Exploits the

prostitution of another person, even with the consent of that person," "Keeps or manages, or knowingly finances or takes part in the financing of a brothel," and "Knowingly lets or rents a building or other place or any part thereof for the purpose of the prostitution of others." Outside of the Convention, however, this nineteenth-century (antiprostitution) view of trafficking today has weak currency. Instead, it is now believed, as articulated in 2012 by the former United Nations Special Rapporteur on trafficking in persons, especially women and children, that "...there are dangers in associating trafficking in persons exclusively with sex trafficking, not least of these being the stereotyping of victims of trafficking as only women forced into prostitution or working in the sex industry" (Ezeilo 2012, p. 4). Accordingly, bodies like the United Nations Office on Drugs and Crime (UNODC) now rarely refer to the sex trade in their monitoring reports on trafficking.

The fashion now is to understand trafficking for the purpose of prostitution as heinous only alongside equal (or greater) concern shown crimes of forced labor in industries like construction, farm-work, and household service. It is alleged that narrowly understanding trafficking as a crime intrinsic to the business of prostitution is selfishly specific because a "focus on women and children who are trafficked for sexual exploitation can affect the identification and assistance of other trafficked individuals, particularly men" (Alvarez and Alessi 2012, p. 143). These "individuals" are not merely overlooked but positively shut out of consideration when advocates go about "inserting sex into trafficking" and orchestrating "the exclusion of other categories of trafficking and other categories of victims," as one anthropologist writes (Peters 2013, p. 221). Seeing trafficking as intrinsically linked to prostitution represents, moreover, an attempt by advocates to draw unwarranted attention to their cause through peddling "sensationalized morality tales of sexual abuse – highlighting lurid or disturbing cases," it is claimed (Weitzer 2014, p. 7). Much of this contemporary view is underwritten by the United Nations Protocol to Prevent, Suppress and Punish Trafficking in Persons Especially Women and Children, commonly known as the "Palermo Protocol," which was enacted in the year 2000. While this instrument still classifies trading for prostitution as a special category of trafficking crime and retains an understanding of trafficking as achieved through the "abuse of power or a position of vulnerability," it newly incorporates "forced labor" into industries like agriculture and hospitality into the definition of trafficking. This innovation at the turn of the century represents a fundamental break with the past and renders contemporary campaigning against trafficking no longer recognizable as a gendered antislavery movement.

At the same time that western governments and international organizations moved away from concern about trafficking in terms of the prostitution of women and girls, there developed in the twentieth century a global sex trade so large that comparisons with the nineteenth century became almost specious. Today, reports of the European Parliament describe, conservatively, a 21-million person trade where "[s]exual exploitation is the main purpose...both globally and in Europe" and in which, in the EU, "figures for sexual exploitation...represent...69% of victims (95%...women and girls)" (Voronova and Radjenovic 2016, p. 10). These figures show a dramatic expansion in the business of prostitution as having occurred in the half century since, among other historical factors, the lifting of capital controls with the end of the Bretton Woods system in the early 1970s. Kathleen Barry (1981) first described this reprised trade in women and girls as "sexual slavery" in 1979, but emphasized it was not the case that "international authorities d [id] not [earlier] know about these practices which violate the human rights of women" (p. 45). Rather,

> they refuse[d] to act against these violations or to expose them. For example, in 1974 the General Secretariat of the International Police Organization, INTERPOL, prepared and submitted to the United Nations a report on the 'Traffic in Women.' (Barry 1981, p. 45)

The trade that was left unacted upon in the late 1960s and in the 1970s included women organized for sex tourism by Japanese men in Taiwan

and South Korea (Norma 2014), Vietnamese and Thai women prostituted by US military men during the American war on Vietnam, (Boczar 2015), and German women traded to German men and British NATO troops in places like Hamburg (Sneeringer 2009). In the 1980s it included the sex tourism of European, Japanese, and American men in Thailand and the Philippines (Matsui 1999) and extensive sex trading in Latin American countries where, as one aid worker reported, in Peru, "about half of the one million adult prostitutes are in fact minors working with false identification cards," and, in Bogota alone, there was a "500 percent increase in child prostitution among children aged 18–13 years old between 1986 and 1993" (Beyer 1995, p. 36).

While innumerable historical links to wartime and prewar systems of prostitution and trafficking exist for these examples, Josh Sides (2006), in a discussion of prostitution in postwar San Francisco, points to factors nonetheless making the twentieth-century trade fundamentally different from that of the past:

> [T]he sex district of the 1960s and 1970s was not simply a relic from the first half of the twentieth century but rather a fundamentally new phenomenon. Infused by the libertinism of the sexual revolution, the eroding legal criteria of 'obscenity,' and the immense profitability of pornography and other forms of commercial sexual entertainment, owners of sex businesses brought an element of explicit, public sexuality to the streets of San Francisco and other American cities that had not existed since the nineteenth century-and then only to a much lesser degree. (p. 355)

His assessment of factors prefacing the "immense profitability" of the sex industry in the twentieth century, particularly in the rich world, is echoed in the 2009 publication *The Industrial Vagina: The Political Economy of the Global Sex Trade*, which similarly suggests that:

> [t]he forces that enabled the pornography industry to develop from a marginal activity, a secret men's business of stag films shown at private parties, to the mainstream industry of today included changes in government and community attitudes and technological developments. In the 1960s and 1970s in western countries censorship controls on pornography were progressively relaxed under the influence of the 'sexual revolution.' (Jeffreys 2009, p. 68)

The twentieth-century global American ascendance, which included worldwide promotion of the "libertinism of the sexual revolution" (Sides 2006, p. 355), delivered the destruction of socialist states like the Soviet Union. Economic "shock and awe" tactics paved the way for a subsequent mass traffic of women out of Eastern Europe into Western Europe and other northern hemisphere countries in the early 1990s. Before this, due to the abovementioned socialist condemnation of prostitution, women and girls had lived largely free of the trade and in societies mostly exclusive of pornography (and this latter environment is still maintained in most of China today) (Liang and Lu 2012). William Husband (2015) recalls that:

> [i]n the final months of Communism in 1991, the USSR Supreme Soviet was considering the resolution 'Urgent Measures to Halt the Propaganda of Pornography and the Cult of Violence and Cruelty' before the demise of the regime rendered it moot. (p. 6)

The subsequent trafficking of former Soviet women into the sex industries of the capitalist world was so widespread in the 1990s that the ethnically stereotyped female name "Natasha" came to refer to trafficking in general. Taking just the example of Ukrainian women, Saltanat Sulaimanova (2006) writes that the:

> Ukrainian Ministry of Internal Affairs. . .estimated in 1998 that 400,000 Ukrainian women were trafficked during the previous decade. The estimate of the International Organization for Migration. . .is that between 1991 and 1998, 500,000 Ukrainian women had been trafficked to Western countries. . .Ukrainian women are the largest group of foreigners engaged in commercial sex work in Turkey. (p. 54)

In the same decade, post-socialist Vietnamese women underwent a similar process of prostitutioni-zation by their countrymen and others:

> Under socialism, the state declared prostitution to be a vestige of counter-revolutionary regimes. Now, the new entrepreneurial class of Vietnamese men, and their business and identity practices fed the growth of the sex trade. These men used bought sex as an enactment of social domination befitting their class through the sexual domination of women. (Nguyen-vo 1998, p. viii)

While women from Vietnam and the former Soviet Union joined their Thai, Filipina, and Korean sisters in the global sex trade in the early 1990s, as the decade progressed, a range of countries outside the communist block similarly underwent the "shock and awe" of American-style capitalist economics (and war) and saw their female populations similarly reduced. Dismantled trade tariffs; deregulated finance, communications, and transport industries; privatized national assets; "structural adjustment" austerity programs; intensified urbanization; lowered taxes; deepening wealth inequality (particularly between women and men); weakened border controls; predatory transnational corporate activity; and technological developments in communications and transport set the stage for the corruption and weakened rule of law that Nils Gilman (2016) says fueled a new "deviant globalization" into the twenty-first century. This involves:

> entrepreneurs…arbitraging pre-existing differences in law enforcement or moral attitudes; that is, identifying goods or services that are illicit (and therefore highly valued) in one locale, and producing or procuring them in another locale where the moral attitudes and legal enforcements against such goods or services are more relaxed or limited. Moreover, once these entrepreneurs develop a secure channel for moving one sort of illicit good, they often diversify into trading other kinds of illicit goods, creating global networks. They use the profits they earn from these businesses to gain control over legitimate businesses. (para. 9)

Ideologically establishing the "deviance" or "high value" of this new globalization was America's "libertinism of the sexual revolution," which filled cultural and ideological vacuums opened up by economic- and military-imposed shocks. Catharine MacKinnon (2006) sees American pornography as having played a concrete role in this process. She writes that, because "the international pornography traffic means that American women are violated and tortured and exploited through its use," we now face a situation where "misogyny American style [now] colonizes the world" (p. 114). Accordingly, "[q]ualities characteristic of but not unique to the United States – including common and casual sexual violence and racism" – have been, through pornography, "promoted throughout the world as sex" (p. 114). This core aspect of twenty-first century deviant globalization is vividly evident in a description from Nigeria published in 2005:

> The impetus to take up sex work among Nigerian girls and women has been reinforced by the whirlwind of globalization, which has initiated intense political and economic changes as well as social transformation worldwide. More social mobility, newer systems of values and lifestyles which favour consumption, early sexual initiation, and access to explicit sexual materials, have caused changes in the everyday behaviour of peoples all over the world… the changing images of the practice of sex work resulting from the liberalization of private life, the commercialization of sex via sex shops, pornographic materials, escort agencies, internet sex sites and orgies, the disappearance of semi-formal limitations and sanctions from state institutions, and the changing value system which has increased materialism, make sex work one of the acceptable ways of getting money for consumer goods. (Izugbara 2005, p. 144)

As the world came to be fashioned in the image of 1970s San Francisco new turn-of-the-century trafficking routes emerged, including Mexican women transported to US border towns (Dalla et al. 2011), Nepalese girls to India (Gurung 2014), Nigerian women to Italy (Aghatise 2004), and girls from the hill tribes of Burma, Laos, and China to Thailand (Feingold 2003). The trade was bolstered by escalating rates of rich-world male sex tourism, such as Singaporean men in Indonesia (Williams et al. 2008), men traveling abroad more frequently for war and business (Onnis 2012; Maffai 2009), male colonization of urban cities (Davin 1998; Zheng 2009), and the development of special economic zones globally, which are now in 4000 locations (Stead 2016). Legacies enduring from postwar decolonization or national liberation struggles in some countries rendered women, and especially indigenous women (López-Entrambasaguas et al. 2013), vulnerable to predation by their freshly politically empowered countrymen (Zembe et al. 2013). Their collective fate is described in numerous Western-funded AIDS-related research studies of the past 20 years, typical of which is one about 83 Black South African women prostituted and drug addled in Pretoria in the year 2000 of whom:

> [a]bout 64%. . .reported that one or more out of their last 10 clients had been violent and 95% of these women reported that violent clients were often intoxicated. . .52% of the women reported that they had been beaten, cut, and/or raped by their clients in the past year. Of these, approximately 44% had been beaten, 19% had been cut, and 27% had been raped. (Wechsberg et al. 2005, p. 60)

## Twenty-First Century Globalized Prostitution

While the global trade in women and children between the twentieth and twenty-first centuries is marked by continuity, the proliferation of the Internet worldwide from the turn of the century now escalates its occurrence. This is the case for two reasons. Firstly, Internet-based promotion of businesses including sex tourism resorts (Todres 1999), mail-order bride agencies (Jones 2011), "webcamming" portals (Bleakley 2014), as well as domestic "escort" prostitution agencies (Wells et al. 2012) affords men exponentially greater access to the sex industry. As noted by researchers in 2013, "[a]dapted by traffickers, pimps, and pornographers, the global reach of the Internet has facilitated sex buyers' access to prostituted women and children, thereby increasing sex trafficking" (Farley et al. 2013, p. 1044). As a result, even rich countries like the USA are now seeing large numbers of their young female citizens trafficked domestically into sexual servitude (Williamson and Prior 2009). Prostitution business diversification, which involves the development of a range of 'semi-prostitution' feeder businesses like "compensated dating" and "sugar daddy" matching sites that lure and groom young women for entry into other parts of the industry (Swader and Vorobeva 2015), is enabled by cyber-connectivity. Finckenauer and colleagues in 2012 noted that, "countries that have lucrative commercial sex venues – brothels, massage parlors, karaoke lounges, topless bars, escort services, and so on – and/or that are tolerant toward or have legalized prostitution[,] create a simultaneous demand and pull for commercial sex" (Finckenauer and Chin 2012, p. 3).

Secondly, cyber-technologies accelerate the development of the global sex trade today because of the vastly expanded access to pornography that the Internet delivers men, particularly in rich countries. This link between pornography consumption and sex industry patronage is confirmed in a number of studies (Farley et al. 2011; Ng and Wong 2016). Pornography itself comprises a form of prostitution, moreover, because, as Jeffreys (2009, p. 2) notes, pornography is different from other forms of prostitution only by virtue of its filmed mode: it still "involves payment to girls and women for sexual access." Women are increasingly trafficked to achieve this access, and so the manufacture of pornography is recognized as a new driver of the global sex trade (Bailey and Shayan 2016). Further, Catharine MacKinnon (2005) highlights the fact that pornography itself, as a product that is traded, actually enacts sex trafficking:

> . . .pornography is one way women and children are trafficked for sex. To make visual pornography, the bulk of the industry's products, real women and children, and some men, are rented out for use in commercial sex acts. In the resulting materials, these people are then conveyed and sold for a buyer's sexual use. The injuries inflicted on real people to make the materials. . .[comprise] the trafficking constituted by the exhibition, distribution, sale, and purchase of [such] materials. . .. (p. 993)

## Contemporary Revival of the Gendered Antislavery Movement

As discussed, the twenty-first century anti-trafficking movement, different from that of the nineteenth century, sees the sex industry as equivalent to any other industry into which people might be contracted for labor or, alternatively, trafficked. It problematizes the latter but not the former. In other words, prostitution, even when organized by a third party, is conceptualized not as sexual slavery but as work. Only when this "work" is subject to nonpayment or force does the contemporary movement recognize it as a potential crime of trafficking. While this understanding of trafficking has not been upheld by all of the appointed United Nations Special

Rapporteurs on trafficking in persons, especially women and children (Sigma Huda did not during her service as Rapporteur between 2004 and 2007), it does appear to be so by the incumbent Maria Grazia Giammarinaro. Across the breadth of her publicly written and spoken statements, concern about trafficking appears to center wholly on the nonpayment of wages (Freedom Network Community 2016). In this way, while representatives of international organizations studiously delink trafficking from an anti-prostitution perspective, they are supported by the range of global organizations that emerged in the early 1990s, including the Network of Sex Work Projects and the Global Alliance Against Traffic in Women. They are further supported by researchers in Western academic institutions who have, over the past 20 years, produced scholarship creating great distance between trafficking and the organization of women and children for prostitution through emphasizing the "choice" and "agency" that is exercised by prostituted people. The notion is fetishized in scholarship to such an extent that even women sexually enslaved in brothels located within the grounds of Nazi concentration camps are these days deemed to have benefited from the experience:

> . . .the brothel was not simply a location where sexual intercourse occurred but rather an available physical space where both men and women were able to resist the processes of dehumanization. Sex and intimacy became a survival tactic that. . .should be considered another facet of "mutual assistance" – that is the formation of relationships between individuals for both material and emotional support. . .sex, even in the SS -supervised brothels, was not always abusive and in some cases helped prisoners to resist dehumanization and to reinvigorate them by providing the support needed to survive. (Anderson Hughes 2011, p. 21)

The understanding of trafficking as wholly delinked from the business of prostitution manifests in domestic country legislation tackling the crime. The Australian government, for example, in its federal anti-trafficking legislation, no longer deems trafficking into prostitution a special category of the crime. In line with this equalizing view of prostitution relative to all other legal industry sectors, countries like Australia, Germany, the Netherlands, and New Zealand maintain deregulated domestic sex industries and classify their proponents as business managers and consumers.

In parallel to these developments, since the turn of the century, there has, on the other hand, been a concurrent revival of the nineteenth-century view of trafficking as the business of prostitution. This revival began in 1999 when the Swedish government passed a law criminalizing all sex industry proponents, including customers, and simultaneously decriminalized prostituted people. Policymakers deemed prostitution a practice of gender inequality and designed public and school education programs as to the human rights harms of prostitution. Under Sweden's policy, prostituted people are afforded wide-ranging rights to welfare services and provisions. South Korea followed Sweden in enacting a similar policy in 2004, and then Norway (2009), Iceland (2010), Northern Ireland (2014), Canada (2015), France (2016), and Ireland (2017) all followed suit. This policymaking approach, commonly known as the "Nordic model," emerged in response to worsening rates of trafficking, especially in Europe, and growing problems of organized crime and violence against women. It is an approach supported by both radical feminists and Christians and particularly by Catholics since the appointment of Pope Francis who has made public gestures against the sex trade (Rome Reports 2016).

International civil society support for the policy centers on the Coalition Against Trafficking in Women, which was founded in the USA in 1988 with the support of abolitionist campaigners and organizations worldwide. These campaigners from early on subscribed to the nineteenth-century view of trafficking as the "supply chain for prostitution" (Jeffreys 2009, p. 155) and so saw prostitution as inevitably generating demand for trafficking, as explained by Melissa Farley (2009):

> . . .theoretical distinctions between prostitution and trafficking simply do not exist in the real world. Men's demand for trafficked women cannot be distinguished from the demand for prostitution. The same qualities in women that are sought by men

> who buy sex are also risk factors for trafficking; for example young age, low price, foreigner or 'exotic', and inability to speak the local language. (p. 314)

Conversely, this view is unyielding of the possibility of trafficking taking place in the absence of prostitution because "what we call sex trafficking is nothing more or less than globalized prostitution," in Dorchen Leidholdt's (2004, p. 177) words. It is a view of trafficking defined by MacKinnon (2011) as the "transportation, transfer, harboring, or receipt of a human being for purposes of sexual exploitation: it is straight-up pimping" (p. 279). In this formulation, in MacKinnon's (2011) words, the "sine qua non of trafficking. . .is third-party involvement" (pp. 299–300). In other words, trafficking is a transactional crime whereby a third party arranges another for prostitution by a customer (i.e., a prostitution buyer). Elements of "transport" or "transfer" attending the crime are understood relationally – they refer to the minimally triadic relationship existing between a pimp, prostituted person, and a customer. The prostituted person is "transferred" between the pimp and the customer; she is "transported" from one to the other or passed between the seller and the buyer like a transacted product or service. Activities bringing about this transaction comprise crimes of trafficking – carried out by various third parties including brokers, pimps, and procurers – and their consequential element is the sexual use of the trafficked person by the end user who is the prostitution customer. Rather than a distorted form of migration, or an industrial problem attaching to the new globalized world of work, therefore, in the revivalist view, trafficking is the means by which the global sex trade is organized.

## What Causes the Globalization of Prostitution?

Poverty, dislocation, and female desperation are routinely cited in explanation of prostitution, as well as the trafficking that organizes the trade. Rarely, however, is the question asked: in that case, how might women be enacting their own prostitution? In other words, how can any aspect of women – their circumstance, background, personal disposition, or anything else – really be understood as *causing* prostitution? After all, as MacKinnon (2011) writes, sex industry customers "are why this industry exists"; it is "[b]ecause of johns – called 'tricks', or 'dates', 'punters' in the U.K. . .[that] women are in prostitution" (p. 282). "If no one demanded the purchase of female bodies for sex, pimps would not supply them," in Swanee Hunt's words (2013, p. 2). It is taken as axiomatic that women will be organized in prostitution whenever they are poor and that trafficking is worsening because escalating numbers of women and children worldwide are affected by neoliberal economic policies of austerity, dislocation, and disadvantage. But, parallel to these global developments, what has caused growing numbers of men to prostitute women at greater frequency over the past 50 years, if we see the global sex industry as having burgeoned during this period? In other words, what has accelerated demand for prostitution among men? At this particular historical juncture, what has caused the fashion to emerge among men that buying someone for sex might be thought reasonable, or even desirable? Is it simply the case that, in biologically essentialist terms, demand was always there, and the workings of capitalism just caused the fetters to come off? Is it really the case that latent prostitution demand always lies dormant in men?

A number of commentators propose answers to these questions. Jeffreys (2009), for example, referring to prostitution directly, suggests that "men can be compensated for the loss of their status in countries where women have made strides towards equality, by outsourcing women's subordination to be consumed elsewhere or from imported poor women" (p. 6). Jeffreys believes that "traditional" forms of patriarchal control of women, such as that within subsistence or tribal forms of community organization, with the incursion of capitalistic, "modern" social pressures, crumbled, and formerly stable hierarchical sexual relations were undermined. Accordingly, men have sought to regain their gender-based standing through perpetrating prostitution and other "public" forms of violence against women. In a

different but related explanation, researchers in 2004 suggested that greater opportunity for travel outside of home environments, and the weakening of constraining factors such as familiarity and community scrutiny that the travel entails, facilitates greater rates of male prostitution buying (Askew and Cohen 2004).

Weakening forms of local, community-based socialization of men and boys is being replaced, on the other hand, by strengthening all-male cyber communities that are structured around pornography consumption and the sexual exploitation of women and children. These communities can positively reinforce sexually dominating behaviors that might have previously been suppressed as destructive to local community relations of dependence. With positive reinforcement comes normalization: a study of participants in an online reviewer forum for sex industry customers found that prostitution "[c]lients develop a dominant market fatalist approach to exchanges with sex workers, so that prostitution is constructed as 'just happening' [and] paralleling everyday consumption practices" (Adriaenssens 2010, p. 1). This banal sexual trading of women and children within the context of men's everyday lives as consumers is a twenty-first century reality that the gendered antislavery movements of neither the nineteenth nor the twentieth centuries have been able to prevent.

## Globalization and Public Administration

David Hayward
VCOSS-RMIT Future Social Service Institute, RMIT University, Melbourne, VIC, Australia

### Introduction

The impact of globalization on public administration has been the subject of considerable academic interest over the last 35 years (see, e.g., Farazmand 1999, 2002; Whitfield 2001; Raco 2013). This has paralleled interest in what has come to be known as Public Choice Theory in economics and the New Public Management in public administration (see Medury 2012: chap. 1; Farazmand 1999, 2007: 1145, 1148, 1162). Both of these are closely aligned with neoliberalism, favoring markets, competition, and private property as preferred vehicles for the delivery of public services.

Those on the right have advocated in favor of them and their embrace of privatization policies, which have become a dominant theme of public administration across much if not all of the western world. Privatization in turn has enabled some, although not all, public services to go global by encouraging and enabling multinational firms to bid for contracts across the globe (Whitfield 2001: 46). Its proponents have been disinterested in globalization as such, in that their main point is that privatization encourages markets, which in turn encourage efficiency and effectiveness (see, e.g., Shirley 1992). Some have argued that globalization has rendered government less relevant, with the degree of policy and budget freedom heavily constrained by flows of business investment (see, e.g., Ohmae 1995).

Those on the left have offered strong critiques, posing important questions about their assumptions as well as effects. Some have questioned the extent to which governments have lost their autonomy (see, e.g., Farazmand 2002; Langmore 2001; Hobson and Ramesh 2002; Rodrik 2011; Klein 2008). They have also expressed dismay at the impact of privatization, arguing that it mainly benefits the new private owners, leaving end users paying higher costs for depleted services while leading to deteriorating working conditions (see Whitfield 2002; Hudson 2014). They point to instances of major policy disasters as evidence while simultaneously drawing attention to the profits that have been pocketed by private shareholders and the high executive salaries that are paid (see, e.g., Walker and Walker 2001; Quiggin 2012; Hudson 2014). Globalization is portrayed negatively as a result, impoverishing the principles of sound public administration while harming governed populations simultaneously.

This chapter explores these competing views by exploring the central propositions at the center

of the debates around the privatization of public services using globalization as a pivot point.

## Globalization, Privatization, and Public Administration: Key Terms Defined

For the purposes of this chapter, globalization is "a process of expansion into new frontiers and opportunities [without constraints] for increasing capital accumulation at the global level. It also views globalization as a phenomenon caused by the process of capital accumulation – a phenomenon that has manifested its negative and positive effects almost everywhere" (Farazmand 2002: 357). The one limitation of this definition is that while it draws attention to globalization's economic dimension, it tends to downplay its cultural, political, and ecological dimensions (see Steger 2009). Also, it is important to acknowledge that there are different understandings and values that underpin approaches to globalization. To try to capture this, Steger (2009) usefully distinguishes between globalization and globality, with the latter being understood as the way differing ideologies imbue globalization with different meaning.

Public administration is both an academic discipline and a professional practice often governed by a robust and enforceable code of ethics and behavioral standards. It is a relatively new discipline, dating from the late nineteenth century and developed in response to the growth of western governments from that time onward. Its subject matter is the organization of public bodies so that they most efficiently and effectively service the public interest. As a professional practice, public administration involves those professions that deliver services on behalf of, and employed by, the state (see Ostrom 2008: chap. 1).

We can usefully distinguish between public administration and public services. The latter are publicly provided, regulated, and/or subsidized organizations that deliver services to citizens. These may be essential services, such as water and electricity. They might also be those associated with the state's responsibility to provide a legal framework, its monopoly over the right to use force, detain people against their will, and protect people in case of emergency. They might also involve the provision of services (or income) that are considered to be so important to human dignity and life that they are provided to all those who need them, free of charge or heavily subsidized. In all these cases, private markets are deemed to fail and left to themselves will either under or overprovide what is needed. Public services may be provided by state employees, or they may be provided by nongovernment agencies.

Privatization is a process involving a restructuring of public administration and public services. It changes the relationships between states and non-state actors so as to transfer the authority to deliver services and sometimes incomes from state-owned entities to for-profit and not-for-profit private entities, sometimes under delegation. It has different forms, including the reduction of regulations, asset sales, share issues, corporatization, contracting, the imposition of user charges, and the removal of subsidized pricing. Privatization rarely occurs in one form only. The sale of assets, for example, is often accompanied by a shift in the regulatory framework and the imposition of a new regime of pricing and user charges (see Whitfield 2001).

It should be noted that governments throughout the west have relied on contracting to deliver a range of services over the last several hundred years while not necessarily embracing privatization. Rather, they have often inherited services being delivered by not-for-profits and sometimes for-profits in essential services and ended up subsidizing and regulating them rather than replacing them with public sector entities. Faith-based and neighborhood organizations, for example, have played a very strong role in social service delivery in countries, such as Germany and the Netherlands, where they play a large role (see Smith 2011).

## Privatization and Globalization

During the 1970s, 1980s, and early 1990s, a rapidly growing literature celebrating privatization in its various forms encouraged governments to consider policy options that were previously almost

unthinkable (Cockett 1994). In addition to straight asset sales, either part of full, options were also developed to contract out work previously done in-house. Early work on contracting out led the British government to compulsorily require local governments to put out to tender large chunks of activity previously done in-house (Birrell and Gray 2017; Considine and O'Sullivan (eds.) 2015; see also Osborne and Gaebler 1992).

In subsequent decades, everything from energy, airports, and air traffic control through to the operation and maintenance of speed cameras, prisons, detention centers, primary and secondary schools, and vocational education was open to sale or private tender. This applies as much to the operation of public services as it did to the building, financing, and maintenance of public infrastructure. The list of privatized public services is extensive, as the incredibly detailed data base compiled and published by the World Bank amply demonstrates (see World Bank Privatization Data Base accessed at http://data.worldbank.org/data-catalog/privatization-database on April 3, 2017). Nellis (2012: 1) provides the following estimate of the number and value of asset sales and contracts in the two decades to 1999 while drawing attention to their remarkable geographical spread:

> Worldwide, between 1979 and the end of 1999, more than 130 countries divested, or turned over to private management, at least 75,000 medium and large enterprises formerly owned and operated by the state. These entities were found in all economic sectors: infrastructure (e.g., telecommunications, water and sewerage, electricity generation and distribution, ports, airlines, postal services, railroads and several facets of road transport), banking, insurance, tourism, and every manner of commercial, industrial and service activity, including a zoo in Argentina and a football team in Mexico. A roughly equal number of small business units was also privatized, the bulk of them in formerly socialist states in East and Central Europe, and Central Asia. Total proceeds to the sellers from privatization in this period are difficult to estimate, but, conservatively, exceeded $1 trillion US [in 2000 dollars].

Privatizations did not of course cease at the end of the 1990s. During the 2000s, the level of privatization activity initially declined but subsequently increased to reach a record high of over US$250 billion in the mid-2000s before falling again following the Great Recession. It has now climbed back up to record levels, with the geographical center of activity shifting decisively toward Asia and China in particular.

## Globalized Public Services

Writing in 1994, the British political scientist, Patrick Dunleavy, saw the implications of this trend to privatize for globalization. He pointed out that:

> Although privatization and contractorization have progressively created 'markets' of various kinds in public administration over the last fifteen years, the involvement of private corporations has overwhelmingly been organized on a single-country basis. Most political scientists and public administration writers currently seem to believe that national political system idiosyncrasies constitute irremovable barriers to the development of broader trans-national corporations dominating public services production. . . (T)he developments of the last decade strongly suggest that these barriers will not prove permanently substantial. (Dunleavy 1994: 37)

One area where this has occurred is finance. First, private advisory firms and associated investment banks have overseen and benefited from almost all asset sales. In addition, we know that globalized private capital has invested heavily in public infrastructure over the last 30 years, in both equity or ownership and debt, a trend that was disrupted momentarily following the Great Recession, but has subsequently resumed in force. Private debt funding of public infrastructure is estimated to be in the order of US$140–$250 billion annually, while equity investment rose to a peak of around US$39 billion by 2007 (Della and Gatti 2014: 20ff). According to Engel et al. (2014), the infrastructure fund industry (that invests in equity) is "quite concentrated. . . Macquarie has a share of about 40 per cent of the total and the top five managers control two-thirds of assets."

Australia was the first to use private financing of public infrastructure in the late 1980s, with the UK following in 1992 under the Private Finance

Initiative. Over the last 20 years, private funding of public infrastructure has picked up a considerable head of steam, reaching almost A$25 billion by 2013. The funds for these projects have been largely sourced from overseas, including bank loans, which have become the single most important source of finance over the last 5 years (Infrastructure Australia 2015). Britain has come to rely on private financing to an even great extent, raising over £56 billion in this way over the last 25 years (Booth and Starodubtseva 2015).

A second related area where privatization and the globalization of public administration have gone hand in hand is in policy advice, accounting, and financial advisory services. Here the increasing reliance on the four biggest global private consultancy practices – KPMG, PwC, Deloitte, and Ernst and Young – by governments across the OECD is especially striking. Collectively, these four firms employ 756,000 people and generate over $120 billion in annual revenues or around the same amount raised by the State of California. Advisory services account for over one third of work done (Big4.com 2014). The influence of these firms is not fully captured by their revenues, however. The projects they work on are worth far more than the value of the revenues they receive for their work. KPMG, for example, won an award for being PPP advisor of the year in 2014 on the basis of projects worth over US$14.7 billion undertaken in three continents and in nine different countries (see http://www.big4.com/news/kpmg-ppp-financial-adviser-of-the-year-accolades-for-kpmg/ accessed on April 4, 2017). Also, their influence extends to the two-way flow of high-level staff into and out of senior roles in the public sector, sometimes short term and sometimes for longer (Raco 2013: 1986).

These Big Four firms have become so large, partly on the back of government contracts, that in the USA, the UK, and Australia, they are now the largest employers of graduates, taking over the role previously dominated by public services (see, e.g., http://www.milkround.com/staticpages/12680/the-times-top-100-graduate-employers/; https://www.bloomberg.com/news/photo-essays/2011-05-17/50-top-employers-for-college-grads; https://gradaustralia.com.au/top-100-employers).

Public transport is another area in which privatization has led to the emergence of global providers of public services. Australia provides a useful. Under the pretext of using markets and competition to deliver more efficient and customer-friendly public transport, Australia's second most populous state, Victoria, puts its railways and tram services out to tender in 1999. Initially there were five franchises, two rail and two tram in the metropolitan area and one for country rail services. The five franchises were picked up by three firms. The first was the British-based National Express (a metropolitan rail line, a tram service, and the country rail service), which was itself a creature of the Thatcher government's privatization program in the UK during the 1980s. The second was Connex (a metro rail franchise), a subsidiary of Veolia, a giant French water, energy, waste management, and transportation company. The third firm was a partnership between a local engineering company, Transfield Services, and another giant French transport company, Transdev, which picked up a tram franchise.

The bids for the rail franchises especially were all based on optimistic assumptions around costs and patronage that proved catastrophically wrong and in 2001 were provided with a A$120 million bailout. Shortly afterward National Express returned its rail franchises for both the metropolitan and country rail services and the tram service. Two years later, it sold out of most of its bus businesses, selling its operations in Perth and Sydney to none other than Connex, the remaining metropolitan train operator in Melbourne. The Victorian government then decided to offer the rail and tram services as two modal franchises. Connex picked up the train franchise, while the remaining tram operator was awarded the sole tram franchise.

In 2009, the Government retendered, and this time new operators were selected. The new tram operator is Keolis Downer, half owned by another giant French transport company, Keolis, and Downer, a large Australian-owned engineering firm that also maintains the metropolitan trains. Downer in turn is owned by CIMIC, a giant engineering, construction, and infrastructure

conglomerate that specializes in privatized public infrastructure. The new rail franchisee, Metro, has three owners, Hong Kong's MTR Corporation, Australia's John Holland Group, and UGL Rail, a division of United Group Limited. MTR owns 60% of the stock.

According to its web site, MTR "was established in 1975 and in 2000. . .(was) listed on the Stock Exchange of Hong Kong. On 2 December 2007 the operations of the Government-owned rail operator, the Kowloon-Canton Railway Corporation, were merged into the MTR. . . In the Mainland of China, the Corporation has been involved in the construction of and now operates Beijing Metro Line 4 and Line 14, Shenzhen Metro Line 4 (Longhua Line) and Hangzhou Metro Line 1. The Corporation also operates and manages London Overground in the United Kingdom, Melbourne Metro in Australia, Stockholm Metro and intercity service between Stockholm and Gothenburg in Sweden,. . . the Crossrail Train Operating Concession in the United Kingdom. . . the Operations, Trains and Systems public-private partnership contract for the North West Rail Link project in Sydney" (http://www.metrotrains.com.au/who-we-are/ accessed on 7 April, 2017).

MTR is not the only publicly owned, globalized transportation giant operating in Australia. Keolis is also publicly owned, with 70% of its shares in the hands of the French National Railways Corporation and 30% resting with the Quebec government-owned pension fund, Caisse de dépôt et placement du Québec. As at December 2013, Keolis employed 54,600 people in France, Australia, Belgium, Canada, China, Denmark, Germany, India, Luxembourg, the Netherlands, Norway, Portugal, Sweden, the UK, and the USA.

Transdev is another of the major players that is majority owned by the public sector, with its main investor being the French government's investment bank, Caisse des Dépôts et Consignations. Transdev operates in 19 countries across five continents, with operations in France, the USA, Canada, the UK, Ireland, Holland, Sweden, Denmark, Finland, Portugal, Spain, India, and Australia. Its annual revenues are 6.7 billion Euros, and it employs 83,000 people.

Energy is another area where privatization has led to the globalization of public services, and Australia again provides a useful illustration. Up until the mid-1990s, Australian state governments operated government-owned integrated electricity and gas companies that operated as regional monopolies. In the mid-1990s, the Victorian government began a process of privatization, when it split up its energy companies into energy producers, distributors, and retailers and then sold them into, often foreign, private ownership. South Australia followed suit in the early 2000s, and although other states similarly split up and corporatized their energy companies, only NSW has gone down the path of privatizating them (in 2015). The federal government meanwhile has established with the support of the states a national electricity market in which a central clearing house facilitates the buying and selling of energy in 30 min blocks. Subsequent to the initial sale, most of these companies have been sold and some resold again, leading to a more concentrated industry structure, with the three biggest retailers accounting for approximately 75% of the electricity and gas markets and with majority ownership of generators, leading national regulators to express concerns about monopolization. A proposal is now being actively considered that will see "three out of five of Victoria's electricity distributors and two out of three of its gas distributors. . .controlled by. . .a single Hong Kong–based infrastructure business under a $7.4 billion takeover proposal. . .(T)he State Grid of China, a state-owned enterprise, already effectively controls electricity distribution in northwestern Melbourne. Along with Singapore Power, the State Grid of China also effectively owns Victoria's network of poles and wires, as well as electricity distribution in eastern Victoria, and gas distribution in western Melbourne and regional Victoria" (Gordon 2017).

Looking across the broad range of privatized services, ownership has tended to become more concentrated as well as more opaque. This is certainly the case with public transport and energy over time, with formerly government-owned and government-operated companies being sold, sometimes after having been split up, and then

subjected to mergers and acquisitions with and by very large overseas-owned companies that tend to dominate public service markets. These firms manage to gradually acquire substantial market power. This inevitably raises the question of whether or not privatization has led to improved efficiency and effectiveness in the way that its advocates claimed it would and ultimately whether or not consumers and taxpayers have been the main beneficiaries. The next section examines the evidence.

## The Evidence: The Jury Is in and the News Is Not So Good

There have been numerous meta-studies that have tried to measure whether or not privatized public services deliver efficiency gains. Their results are rather mixed. As Nellis (2012) points out, despite this variation, on balance the evidence shows that privatization has delivered efficiency gains. It is probably this is at least partly because the charters under which the nationalized entities were previously operating included a broader range of social objectives, such as those relating to the environment, training of apprenticeships, and the delivery of in-built and deliberately hidden cross subsidies to nonurban populations. When companies are no longer required to provide services to the poor or the remotely located and are able to de-unionize their workforces, it is not surprising that they are able to produce more at less cost. What this research has not been able to answer is the degree to which increased efficiency has been achieved at the expense of effectiveness and also who has benefited from the improved efficiencies. Have privatizations benefited consumers, workers, or the new owners? It is to this question that attention now turns.

### Private Financing of Public Infrastructure: Does It Make Cents?

The use of private finance to fund public infrastructure is sometimes justified on the basis that private financiers will be able to secure funding in a more efficient way than their public sector counterparts. These efficiency gains will help lower the cost of the infrastructure that is being financed.

As Engel et al. (2014) point out, however, this is a fallacy. Finance does not have any impact on economic efficiency. As they put it: "Ultimately, social value is created by the efficiency with which real capital is deployed and used – the real side of the balance sheet – not by the financial composition of the liabilities side" (p. 205). The argument suffers from a second problem in that private finance is more costly to secure than public finance. In the UK, the gap in 2013 was estimated to be a rather large 4% points (Booth and Starodubtseva 2015: 12). This gap arises because of the "riskless" nature of lending money to governments, which have the compulsory power to tax as a means of ensuring that they are always able to repay debts when they are due.

This in turn raises the question of why, if public finance is cheaper, governments bother to use private finance at all. The answer is basically to be able to keep the debt off the governments books and push it on to a private sector party (Engel et al. 2014). This does not alter the need to repay the debt. It just ensures that the costs end up being captured through leasing payments made over many decades, which figure as an operating cost on government budgets. And these can prove to be very costly. In the UK, 7 hospital trusts covering 21 hospital were close to becoming technically insolvent because of the size of the leasing payments that they had entered into in order to secure new facilities. As described by Youssef El-Gingihy (2016):

> Up and down the UK, Private Finance Initiatives (PFI) are destroying public services. . . .(T)he PFI policy was designed to use private financing to build and run public sector infrastructure projects. . . .The projects work like a mortgage, with repayments on the work completed made over decades. There is just one snag: the interest rates for PFI agreements are scandalously high. The NHS has more than 100 PFI hospitals. The original cost of these 100 institutions was around £11.5 billion. In the end, they will cost the public purse nearly £80 billion. The total UK PFI debt is over £300 billion for projects worth only £55 billion. This means that nearly £250 billion will be spent swelling the coffers of PFI groups. (Accessed at http://www.

independent.co.uk/voices/nhs-funding-pfi-contracts-hospitals-debts-what-is-it-rbs-a7134881.html on 10 April, 2017)

It is very unlikely we will ever know whether the privately financed infrastructure represents a good deal, due to commercial-in-confidence contracts that continue to ensure the schemes are anything but transparent, even to the House of Commons public accounts committee and the UK National Audit Office, which for many years now have been trying to find answers to these questions without success. A recent Briefing Paper by the British House of Commons Library points out that even the British Treasury has expressed concerns about the PFI (Booth and Starodubtseva 2015: 10).

Another problem with private financing is that the contracts are notoriously complex and can run to thousands of pages, as was the case with the London Tube in the early 2000s. Its contracts were so complex; it is estimated that £180 million was spent by the public sector and a staggering £275 million by the private bidders negotiating them (National Audit Office 2004). Their extremely technical nature requires government to turn to advisors to help structure schemes in the most effective ways. The Big Four advisory firms mentioned earlier have been significant players in this space, helping to design public-private partnerships throughout Australia and in the UK and in some cases helping government departments and bidders for contracts at the same time as they are responsible for auditing their finances (see Vasagar and Evans 2002; see also Raco 2013).

## Public Transport Winners and Losers: The Australian Case

The privatization and globalization of Australia's public transport has been a rather mixed experience, at best. For the first decade of privatization in Victoria, service standards proved difficult to improve and customer satisfaction levels remained low, although recently appear to have lifted, but they remain surprisingly difficult to monitor. The Victorian Auditor-General has pointed out that, "there are no targets for the reliability and punctuality of trains and trams. . . – the publicly reported reliability and punctuality figures are not directly connected to the bonus and penalty payments that franchisees receive" (2016: 17). While there are customer service standards, the public transport agency "has not held the franchisees to account for their compliance with these Standards" (2016: 19).

To this day, the private tram operator continues to monitor and report on its level of service rather than an independent auditor. A 2016 report by the Victoria Auditor-General concluded that: "the monitoring sites along each route do not provide enough data to accurately assess service performance for the entire length of a journey. . .there are longstanding problems and risks that affect the reliability of the (monitoring) system. It uses technology from 1987, and the risks and limitations of the technology may affect safety, operational performance and passenger information which in turn is crucial to unlocking state government performance payments" (p. 16).

There is then no clear pattern of sustained performance improvement to the extent that they have occurred critics point to large increase in subsidies. The promised cost savings to taxpayers (estimated to be $160 million when the system was privatized) have not materialized. Indeed, payments to the rail and tram operators have increased threefold, from $450 million in 2009 to over $1.45 billion in 2015. In real terms, it is costing more to run public transport today than was the case when it was privatized during the late 1990s (Mees et al. 2006; but see Allsop 2007 for a critique).

Controversy continues to bedevil the privatized system today. The public transport corporation has been the subject or a damning Auditor-General's report (Victorian Auditor-General 2015) for failing to put private bus contracts out to tender and for failing to develop and implement a performance funding regime, and Metro has been accused of trying to monopolize rail maintenance activity by stealth with the Government commissioning KPMG (another of the globalized public services) to review arrangements (*The Age*, May 2, 2015).

### Privatized Energy Winners and Losers: The Australian Case

Subsequent to privatizations, service standards and pricing have continued to be a major concern. Despite being regulated, price increases have been well in excess of inflation. According to the Australian Parliamentary Library: "In real terms. . .prices for households increased on average by 72% for electricity and 54% for gas in the 10 years to June 2013. Real electricity price increases for manufacturing businesses over the same period have been of a similar magnitude (60%). For gas, prices for manufacturing businesses have risen to a lesser extent" (accessed at http://www.aph.gov.au/About_Parliament/Parliamentary_Departments/Parliamentary_Library/pubs/BriefingBook44p/EnergyPrices on April 10, 2017). More recent research by the Grattan Institute confirms this overall trend:

> Competition in electricity retailing hasn't delivered what was promised: lower prices for consumers. The failure is worst in Victoria, the state with the most retailers and the longest experience of deregulation. Profit margins appear to be higher than in other retail sectors. . . Lower price deals are available, but most consumers find the market so complicated that they have given up trying to find them. . . Electricity is an essential service without substitutes, so many consumers feel stuck and simply give up. (Wood and Blowers 2017: 3)

Australia has gone from being a low-cost energy producer by world standards to one of the most expensive (ABC News online, March 21, 2012, accessed at http://www.abc.net.au/news/2012-03-21/australians-pay-highest-power-prices-says-study/3904024). In addition, some of the big overseas-owned energy companies have been at the center of major disasters. The Kilmore East-Kinglake "Black Saturday" bushfires in 2009 resulted in 119 lives being lost and 1000 homes being destroyed in what was the worst day of bushfires in Victoria's history. Survivors won the largest class action in Australia's history, using evidence and conclusions reached by the Victorian Bushfires Royal Commission, which found the Kilmore East-Kinglake bushfire was caused by an aging power line maintained by SPAusnet, the Singapore government-owned monopoly (ABC News, 2015, accessed at http://www.abc.net.au/news/2014-07-15/black-saturday-bushfire-survivors-secure-record-payout/5597062 on April 10, 2017).

On 9 February 2014, fires broke out in the Hazelwood coal mine in the rural town of Morwell as a result of embers spotting from bushfires. The mine fire burned for 45 days, sending smoke and ash over residential neighborhoods for much of that time. It is possible that up to 11 people died as a result of the fumes they inhaled. The mine was owned by SDF Suez, one of the giant French companies with a foothold into Australia's utility industries as a result of privatizations (subsequently re-branded as Engie). Two state government-appointed Boards of Inquiry into the fire and its consequences were scathing about the company's role. The first Inquiry concluded that GDF Suez was, "inadequately prepared. . .(A)ll but one of the GDF Suez personnel nominated as an Emergency Commander. . .were out of Morwell on a weekend break or holiday. . . GDF Suez personnel failed to activate the mine's Emergency Response Plan until more than an hour after fire was first reported." It was also scathing about the Victorian government's palpable failure to establish a robust regulatory framework to ensure privatized operators met their OH&S and emergency fire responsibilities: "The Hazelwood mine fire was a foreseeable risk that slipped through the cracks between regulatory agencies" but nevertheless concluded that ". . .GDF Suez fell short of its obligations under OHS laws." Finally, the Board drew attention to GDF Suez's decision over many years to allow its firefighting and suppression infrastructure in the disused part of the mine to be maintained adequately, preferring instead to redeploy facilities to parts of the mine that were of economic value, leaving the mine open to precisely the sort of disaster that eventuated on (Hazelwood Mine Fire Inquiry 2014, accessed at http://report.hazelwoodinquiry.vic.gov.au/executive-summary.html on April 10 2017; See also Doig 2015).

Gas supplies have also come under increasing public scrutiny in recent years, with the new private owners of natural gas companies redirecting

gas to export-oriented LNG plants, which will see Australia become the world's second largest exporter of LNG. This in turn is leading to large price increases and the threat of gas shortages for the domestic market. One of the three large private owners that dominate local gas production has proposed establishing gas importing facilities, to reimport the gas they have sold onto the international market, demonstrating that the government-manufactured market is enabling all sorts of surprising profitable deals to be struck, at the expense of consumers (http://www.theaustralian.com.au/business/companies/agl-floats-gas-generation-as-fix-for-energy-woes-in-blackout-state/news-story/83aa7258a285b75545105296849321b2).

Australia's energy system is now under enormous stress, with blackouts or the threat of them becoming a regular summer event in states such as South Australia. After the most recent blackouts, the South Australian Energy Minister and Treasurer concluded that electricity privatization was the: "worst decision taken by any government in the state's history… We are now at the mercy of privately owned foreign-based companies who own all of our electricity assets. Half of your energy bill is the poles and wires. Poles and wires that South Australians built and put in place have now been sold to other companies" (quoted in *The Australian*, January 27, 2017).

Interestingly, the globalized and privatized public service providers feature strongly in the list of companies that pay little tax. In 2014/2015, Metro trains reported total income of $1.2 billion but taxable income of only $95.6 million, resulting in a tax bill of $28.7 million. Transdev reported total income of $485 million but taxable income of only $25 million, leading to a tax bill of $7.5 million. Ausnet services reported total income of $1.8 billion but taxable income of $256 million, resulting in a tax bill of $75 million (http://www.theaustralian.com.au/business/economics/ato-figures-show-36pc-of-big-firms-paid-no-tax-in-2015-year/news-story/5620bb2d1af3161882bcd17eab08c450).

Privatized public services are also notable because of the much more unequal distribution of income within their operations. The extreme examples are the private financiers of public infrastructure. The Victorian Treasury Corporation is the entity responsible for traditional public finance operations on behalf of the State government. It has six executives whose pay between them in 2015 and 2016 was a little over $2 million. By way of contrast, the top 11 Executives of the Royal Bank of Scotland, a major player in arranging private finance for public infrastructure, may receive in total £34.6 million (RBS Annual Report 2016: 111). The Commonwealth Bank, which is also a major player in lending for private infrastructure, paid its top 12 Executives over $42 million collectively in 2016 (Commonwealth Bank (2016), Annual Report to Shareholders, 2016).

## Privatization and Globalization: A Smaller or Larger State?

One of the key arguments put forward by advocates or privatization is that it will lead to a smaller state. This will occur because divestitures shift public sector entities into the private sector and because competition will drive efficiency gains. The end result is the need for less public spending. To what extent has this occurred?

Figure 1 shows aggregate general government spending for all OECD countries from 1972 through to 2014 as a percentage of GDP (a broad measure of the size of the economy). The figure shows that government spending has not in fact fallen but has continued to edge upward and this is despite governments across the OECD embracing privatization policies enthusiastically, as was shown earlier.

This tendency of the size of government to continue to expand has drawn the attention of a number of conservative commentators, who recognize that privatization policies have not been well implemented, serving the interests of a select group of business interests at the expense of consumers and taxpayers. They refer to this development as the arrival of "crony capitalism" (see, e.g., Sloan 2016; Hewson 2017; McCrann 2017). Remarkably, even those who were the most enthusiastic supporters of the reforms that have been implemented are coming to recognize that they have not delivered to consumers the benefits that were promised. A recent report by the Adam Smith Institute, one of the UK's leading advocates for privatization, recently concluded that:

**Globalization and Public Administration, Fig. 1** General government spending for all OECD countries as % of GDP (left hand axis), 1972–2014. (Source: The World Bank database accessed at http://databank.worldbank.org/data/reports.aspx?source=2&series=GC.XPN.TOTL.GD.ZS&country=# on 10 April, 2017)

> For utility customers, privatization has had mixed blessings... Very few of the privatized utilities operate in a genuinely competitive market... long-term monopolies have been effectively endorsed whilst price regulation has had to be implemented rather more widely than many advocates of privatization had hoped. Importantly, too, except in telecoms, there have been marked real price increases – for varying reasons – over the period since privatization began in earnest. (Hawkins 2015: 15, 18)

## Conclusion

Privatization has been a major contributor to the globalization of public services and administration. Despite a very mixed track record for consumers and taxpayers, it continues to enjoy a surprisingly strong level of support among mainstream political parties. However, opinion polls show it is very unpopular with citizens and it has been that way for some time now. As Nellis observes, "The fact is that privatization has never been popular among citizenries or electorates in general; and workers, particularly in the public sector, and their union representatives detest it" (2012: 20).

This in turn raises a series of important issues that are at the heart of many of the fault lines that currently bedevil western democracies still trying to come to terms with Brexit and the election of the Trump Administration, widely interpreted as a set back for globalizers. There is a large gap between the promise of privatization and the reality. Its promise has been to use private markets to deliver efficiency gains that benefit taxpayers, as a result of falling government spending, and consumers, who get to choose. The reality is that privatization has lead to globalized industries for public services out of which the new owners seem more often than not to make a good return, with sustained fall in prices being hard to discern and government spending continuing to rise. Consumer choice on the other had has too often been a fiction, with privatized industries becoming progressively more concentrated and ownership structures opaque, with complex pricing regimes being put into place to make it almost impossible for consumers to be free to choose. The chorus of voices pushing for a change of policy direction is now becoming too loud to ignore. The coming decades promise to be the most interesting for public administration for a very long time, with much depending on how well our policy makers are able to listen rather than be led by the entrenched, globalized private interests that seem to have come to depend on privatization for a living.

### Synonyms

Population health

### Introduction

The discipline of public health is concerned with the promotion of collective decision-making and actions aimed at improving the health of a community. Its areas of focus are very broad and include infrastructure programs such as sanitation, water, and housing; medical interventions such as vaccination programs, disease eradication, and development of response protocols; regulatory functions such as tobacco and alcohol control; education campaigns such as breastfeeding or hand hygiene; agricultural controls such as quarantine, livestock control, and border controls of plant and animal products; and injury prevention and mitigation.

The American Centers for Disease Control and Prevention (CDC) defines public health more precisely as "the science of protecting and improving the health of families and communities through promotion of healthy lifestyles, research for disease and injury prevention and detection and control of infectious diseases" (CDC 2017). The definition of the European office of the World Health Organization adds "prolonging life and promoting health through the organized efforts of society" (WHO 2017).

However it is presently defined, initiatives that may be associated with public health have extended across the world from ancient times – long pre-dating the emergence of public health as a formal discipline within Western medicine. Historians Schneider and Lilienfeld begin their chronology of public health in 500 BCE, with the construction of the Cloaca Maxima, or "Big Sewer," and the subsequent network of sewers, aqueducts, and baths that were built as the city of Rome expanded (2008, p. xix). Mays et al. show that large-scale public water storage and delivery systems date back even further, to at least 3,500 BCE (2013, p. 1916). Istanbul's famous Byzantine Basilica Cistern was part of an extensive system of cisterns and aqueducts that supplied Constantinople's water in the sixth century CE (2013, p. 1928). Cairo's water was supplied via an aqueduct from the southern desert from 890 CE (Schneider and Lilienfeld 2008, p. xix), and Becerril and Jiménez note that the Aztecs developed systems for collecting human waste and built aqueducts to bring potable water to Tenochtitlan from mainland springs in the mid- to late 1400s (2007). The late seventeenth and early eighteenth century saw the development of sewerage systems in European cities (Schneider and Lilienfeld 2008, p. xx).

Although full consensus is lacking on precisely when public health as a discipline first appeared, boards of health began to be formed throughout Europe and in America in the mid-nineteenth century, with the London epidemiological society being formed in 1850. In 1854, British doctor John Snow mapped the incidence of cases of cholera in London's epidemic against a map of drinking water sources. His removal of the handle of a drinking water pump ended the epidemic (Schneider and Lilienfeld 2008, p. xxi) and brought legitimacy to epidemiology, the branch

of medicine that studies the incidence, prevalence, and control of disease, and is most closely linked to public health.

## The Distinctive Nature of Public Health

Public health as a discipline possesses features that differentiate it from the rest of medicine in fundamental respects. The most conspicuous of these is its link with the official organs of social authority. Public health establishes a direct relationship between medicine as a civil society enterprise and the institutions of the state, bringing medicine and the state into a direct and open partnership.

The formation of public health did not occur in a vacuum: it came into existence as a part of the extensive process of reorganization of power and mechanisms of control within modern societies that marked the shift from sovereign monarchies to the emergence of the nation state. The power of the sovereign had gradually given way to systematic deployments of civil society and cultural institutions which legitimized and enforced disciplines imposed on European populations to ensure the functioning of economic and political institutions (Foucault 1973, 1977, 1978). The extensive array of microtechnologies of power that thereby emerged generated an internalization of disciplinary processes, forming the modern "panopticon/synopticon" (Foucault 1977; Matheison 2004). Public health contributes to this schema both by providing it with legitimating justifications and by adding a further mechanism of regulation in the form of "biopower" (Foucault 1980; Nadeson 2008). By constituting all citizens as "subjects" of health and healthy living, which is then defined by public authorities in terms of an ever-increasing array of adjustments in personal behavior, the compliance of the entire population is secured (Foucault 1978, 1980).

From this perspective, public health becomes a two-edged sword: on the one hand, it appears as a progressive force, because individuals are no longer cast as the passive subjects of medicine and science but instead are called upon to take control of their decisions. However, on the other, this new-found "autonomy" is seen to be illusory, because it really involves the extension of control of individual subjectivities into that of entire populations.

Although public health is seen as a Western, scientific endeavor, cross-cultural data show that all societies have established processes and technologies for collective health protection (Rivers 1924; Douglas 1966; Baer et al. 2013), with practices such as burning of houses and possessions of people who die of infectious diseases having been common in many societies (Rogers 2016). Even when they are similar to biomedical techniques, such as quarantining and separation for infection control, these are rarely acknowledged as public health practices.

## Health, Wealth, and Power

The relationship between wealth and health has long been documented in the public health literature. The 1838 Poor Laws Commission in London linked poverty to disease, poor housing, and sanitation (Schneider and Lilienfeld 2008, p. xxi). In an article in *Science* published in 1920, entitled "The Untilled Fields of Public Health," Winslow (1920) established a clear connection between poverty and ill health in North America. In the late 1990s, the British government commissioned a report into health inequalities: its main finding was that health inequalities are closely linked to economic inequality (Acheson 1998). Since global systems of production affect resource distribution across the world, it is important to consider this relationship between economic equality and health equality in the global context. Schrecker and Bambra, for example, argue that current global political and economic structures cause ill health (2015). Michael Marmot, a member of the scientific advisory group on the Acheson Inquiry, coedited the World Health Organization's volume *The Solid Facts: The Social Determinants of Health* (Wilkinson and Marmot 2003), which identified stress, early life, social exclusion, work, unemployment, social

support, addiction, food, and transport as factors in determining people's health. In addition, they identified people's positions on the social gradient, that is, how economically well off a person was compared to others in their community as well as how well off their community/country is compared to other communities/countries, as being a key determinant of health (2003, pp. 9–10).

The social determinants framework has been adopted by both the World Health Organization and the United Nations as being central to global public health policy; however, it sits alongside policies set within neoliberal growth paradigms which many commentators argue are key causes of the economic inequity central to social determinants (Shrecker and Bambra 2015; Brown 2015; Spaiser et al. 2016).

## Aspects of Public Health in the Contemporary Period

While early European and American innovations in public health were largely funded by philanthropic donations from "the wealthy" to ameliorate unhealthy living conditions of "the poor," by the middle of the twentieth century in Western-style democracies, public health was almost exclusively the domain of national, state/provincial, and/or local government bodies. From World War II to the end of the twentieth century, global public health activities were funded by nation states' contributions to transnational institutions, such as the World Health Organization and the United Nations. In 2000, private philanthropy re-entered the public health sector, with the Bill and Melinda Gates Foundation and what is now known as the GAVI vaccine alliance. Since then, private philanthropy has come to play an increasingly significant role in funding global public health programs.

The partnership with philanthropic organizations has, however, been controversial. Its advocates argue that transparent private philanthropic organizations such as the Gates Foundation can deliver programs more efficiently and effectively than multilateral agencies (Savigny and Adam 2009). On the other hand, critics of the entry of high levels of private money into the global public health sector raise concerns about connections with industry, most particularly the pharmaceutical industry (Hafner and Shiffman 2013). These concerns are reminiscent of experiences from the 1970s and 1980s "green revolution," in which industrialized agricultural development was seen as the "solution" to poverty, but which in fact was driven by the for-profit agricultural chemicals industry, with widespread disastrous effects (Clunies-Ross and Hildyard 1992). The shift from subsistence agriculture to cash cropping, and the enmeshment of smallholder farmers into global seed, fertilizer, pesticide, and herbicide markets, has resulted in questionable benefits and palpable drawbacks for many communities (Kimbrell 2012). Similarly, some advocates argue that market incentives provide the most effective way of delivering much needed pharmaceuticals to impoverished communities (Savigny and Adam 2009), while critics argue that "Big Pharma" is profiting at the expense of the poor (Bell and Figert 2012; Hogarth 2015; Gabe et al. 2015). Bell and Figert describe the "pharmaceuticalization" of global public health, in processes which link human rights discourses with a right to medication, with clear benefits for pharmaceutical manufacturers and distributers (2012). Clinical trials in impoverished communities have long been criticized for creating disproportionate burdens on poorer communities (Simpson et al. 2015) for the benefit of wealthier communities to whom the pharmaceuticals are then marketed (Bell and Figert 2012). Tying international trade agreements into global public health agendas, such as through the TRIPS agreement (World Trade Organization's Trade Related Property Rights agreement), has supported the access of pharmaceutical companies to impoverished communities for clinical trials (Sariola et al. 2015) with mixed benefits for local communities (Simpson et al. 2015). At its worst, this can be understood as continuing the reproduction of colonial relationships of structural violence and inequity that disproportionately impact vulnerable members of the global community (Connell 2012).

## Public Health Governance in the Global Era

The concept of "good governance" has become popular in recent decades and is increasingly being applied in relation to public health (Brand 2007). According to the United Nations Economic and Social Commission for Asia and the Pacific (UNESCAP), good governance involves the satisfaction of eight criteria: participation, consensus orientation, accountability, transparency, responsiveness, effectiveness, equity, and abidance with the rule of law. Good governance also relates to the establishment of democracy and elimination of corruption and violence, all of which have been linked to population health and well-being (Brand 2007; Laaser et al. 2002).

The conditions of globalization present new problems in relation to how the health of populations is to be approached in an era of global interconnectivity. In the twenty-first century, global forces are exercising a rapidly intensifying influence on local health systems and indeed on the bodies of all people. These global forces include the emergence of institutional arrangements for multilateral public health decisions, as well as the broader social, economic, and political forces of globalization. The broader forces of globalization and the geopolitics of the global era permeate public health approaches from the local to the global. The term "global health governance" is now a well-established term used in discussion of how globalization affects the pursuit of public health at the national and international levels (Fidler 2002, p. 6).

## Strengths of the Global Health Perspective

Understood in its expanded sense, public health can provide access to valuable insights and actions not previously available. (The following is adapted from material published in Long et al. 2017.) The broader project of global health, within which global public health is articulated, presents an opportunity to explore the complex relationships between the health conditions of populations in different parts of the world. For example, Shrecker and Bambra (2015) demonstrate that many of the factors associated, directly or indirectly, with malnutrition or under-eating, can be linked to nutritional problems associated with overeating. Similarly, the appropriation of land for industrial monoculture affects the health of local communities by limiting local access to prime horticultural and agricultural land as well as access of multiple end users around the world, through the provision of cheap but highly processed diets (Clunies-Ross and Hildyard 1992; Kimbrell 2012). The demand in the West for cheap sugar and tobacco (dating to the colonization of the Americas) has adversely affected health in both Britain and the Caribbean and has contributed to loss of both quality and years of life (Thomas and Bean 1974, p. 914, in Austen and Smith 1990, p. 95). The broad perspective that the global health approach potentially makes possible allows us to perceive interconnected health implications for geographically separated populations involved in the same global production systems.

A global health approach is invaluable if we are to understand properly local health issues in a globalized world. Used critically, framing health in a global perspective can allow us to examine and acknowledge the impact on health systems and population health resulting from international development interventions, such as in the case of Haiti and Jamaica, where the IMF-led structural adjustment programs have badly damaged the health of local populations (Handa and King 2003; Pfeiffer and Chapman 2010).

## Limitations of Global Health

Against these strengths, the concept of global health and the mental models associated with it suffer from a variety of limitations. These include issues relating to the homogenization of culture, cultural biases, macroeconomic and macropolitical variables, the overestimation of Western contributions, and the overreliance on statistical markers of disease, medical dominance, and prevailing approaches to understanding cultural

difference. All of these factors apply to the global form of public health.

### Inappropriate Homogenization of Culture

Global health supports a tendency toward the homogenization of cultural knowledge and expertise. The very assumption that conditions of health can be described and addressed at a global level of generality stimulates theoretical formulations and practices that systematically ignore local cultural differences.

It cannot be taken for granted that somebody from an urban, wealthy, educated background in India, Sri Lanka, Australia, or Brazil can understand the daily lived realities of – let alone communicate effectively with – rural people or impoverished, socially excluded people of their own nationality, although this is frequently assumed. In many countries around the world, entry to medical, nursing, and/or allied health training is limited to those with educational and financial privileges not available to people born into poorer communities. This can create situations wherein health professionals do not readily understand the lived realities of their patients, causing communication barriers that make it even more difficult for the poorest and most disadvantaged populations to receive adequate and appropriate health care (see, e.g., Trugman 2000; DeSouza 2014; Barasa et al. 2017).

The assumption of a single, worldwide system according to which the meanings associated with health and illness and the causal relationships between "society" and health outcomes can be conceptualized fails to recognize the often critical importance of local systems of symbolization by which meanings and values are formed and developed. Kleinman argued that an essential part of every health practitioner's role is to be active in understanding the health belief systems of both themselves and their patients (1978). These are not insights that have fully permeated global public health practice.

### Cultural Biases

The concept of global health itself incorporates key assumptions about the nature of health and well-being and the meaning-construction processes around them that operate strongly in global public health. Despite formal acknowledgement of the importance of culture in relation to health practices and outcomes, much development health theory and practice continues to operate within a particular culturally constructed set of values and methods of analysis that is largely unquestioned. Despite its supposed democratic intentions, the implementation of health policies and services often intensifies the very relationships associated with colonialism and hierarchy that it claims to oppose. For all their radical-sounding language, global health and public health discourses remain embedded in a hierarchical and imperialist framework that upholds Western medical systems as templates for ideal health systems in non-Western countries.

The framework that emerges from these assumptions imposes a structural impediment on much development health practice. The cultural biases associated with the underlying concepts are never far from the surface, as the mere use of the word "global" shows. While this is generally taken to imply an acceptance of – and respect for – "non-Western" perspectives, the reality is that, in both theory and practice, populations are regularly classified in accordance with Western socioeconomic, class, and educational categories, the financial contributions and positive impact of donor countries are overestimated, and the unilinear direction of influence, policy, knowledge, and practice is disguised.

### Macroeconomic and Macro-political Factors

Although critiques of neoliberalism are far from new, they have only recently been meaningfully incorporated into discussions about global health and global public health (Brown 2015; Spaiser et al. 2016), and as a result, they remain peripheral and underdeveloped. Economist Susan George's insightful early critiques of the health costs of neoliberal economics and structural adjustment programs (1974, 1988) were not taken up widely in public health discourses. Similarly, Paul Farmer's (2004) articulation of "structural violence" (i.e., institutionalized disadvantage that prevents certain groups of people from meeting their fundamental needs), using Haiti as an

illustration of the harm caused by International Monetary Fund (IMF) policies (Farmer 2004), is recognized as a major contribution in critical medical anthropology (Baer et al. 2013, pp. 63–66) but has not yet penetrated deeply into international and global health theory. Global health discourses pay superficial attention to these critiques but rarely enter into serious analyses of how macroeconomic and macro-political factors and associated inequities in resource distribution are connected with health outcomes. For example, although the roles of transnational corporations in global systems of production have far reaching impacts on the health of individuals and communities across the world (Hawkes and Popkin 2015), these connections still do not feature prominently in global public health decision-making and policy.

Furthermore, while reference to the "social determinants of health" has been widely popular in discussions about international public health (Wilkinson and Marmot 2003; CSDH 2008; Marmot 2005, 2015), this has not generated a critical reflection on the need to address large-scale economic factors in determining WHO policy (Schrecker and Bamabera 2015). The uncritical adoption of a social determinants approach is embedded in the sustainable development goals (SDGs) and the preceding millennium development goals (MDGs). The MDGs contained eight goals and a total of 21 targets and were informed by health and education agendas as drivers of development, supported by economist Jeffrey Sach's argument that improving a nation's health is an investment rather than a cost and inevitably has flow-on effects measurable by an increase in economic growth (Brown 2015).

The MDGs were commonly regarded as a success, albeit with some qualifications. A number of the targets were achieved, with significant impact in several areas, although results in other areas were disappointing (Murray 2015). The SDGs saw new players enter the arena and were associated with a longer, more extensive, and more inclusive consultation process (Murray 2015; Fukuda-Parr 2016). The increased breadth and depth is reflected in the number of goals (17) and targets (169). One goal, containing 13 targets, is specifically health related, while another ten health-related targets arise from other goals (see Brown 2015, p. 1392).

Sach's argument has been widely accepted and was one of the central principles driving the MDGs (Murray 2015). The reverse idea – that economic growth as measured by GDP is a necessary driver for both development and improved global health – has been incorporated firmly into the SDGs in Goal 8: "Promote sustained and inclusive economic growth, full and productive employment and decent work for all." Economic growth is, in other words, enshrined as a stimulant for development and assumed to be able to underpin the pathway to environmental sustainability, which is central to seven of the goals. These assumptions have been the subject of widespread criticism. For example, in a piece scathingly titled "The Oxymoron of Sustainable Development," Brown (2015) roundly rejects the idea that environmental sustainability can be achieved through a neoliberal capitalist economic growth model. Similarly, Constanza et al. argue that the "single minded focus on GDP growth has exacerbated inequity and environmental damage in many countries" (2016, p. 59). As a result, Brown suggests that we "need aggregate metrics of human and ecosystem well-being to replace growth in Gross Domestic Product (GDP) as the primary development goal for nations" (2015, p. 1027; see also, e.g., Hawkes and Popkin 2015; Wanner 2015; Constanza et al. 2016).

In spite of extensive evidence of the flaws in the proposition that economic growth models are pathways to environmental sustainability, the SDGs incorporate the assumption that economic growth within global markets leads to improvements in individual, community health, and population health measures. This exposes the neoliberal paradigms embedded within global policy instruments, which remain unchanged despite decades of research demonstrating the damage of this model. Under these conditions, development practitioners risk becoming agents of economic globalization, particularly when they implement programs involving biomedically oriented clinics and hospitals, health technology, equipment, pharmaceuticals, and Western-trained

practitioners, all of which require ongoing relationships with global markets in order for health infrastructure to be maintained.

When it is conflated with the concept of "development health" – that is, the development of health infrastructure and resources – the expressions "global health" and "global public health" become misnomers. The focus of development health is unequivocally on one section of the world's population: the poorer section. Global health debates frequently apply only passing reference to health in wealthy industrialized countries, and then this is usually only by way of drawing comparisons to disease burdens in relatively disadvantaged contexts. University courses in global health and global public health frequently start with statistics about how people in the Euro-American countries are more likely to die of cardiovascular disease or cancer than those in poorer countries (WHO 2015) and a discussion about how the inhabitants of sub-Saharan Africa are more likely to die of infectious diseases, malnutrition, and respiratory illnesses (WHO 2015). Although lip service is paid to the fact that the USA spends the largest amount on health care per capita in the world and yet still significantly underperforms on most if not all indicators of equity and effectiveness of health delivery (Mintzberg 2012, p. 4), this is not seen as an impediment to US agencies being granted a major voice in global health policy. Critical evaluation of Western-style health systems (see, e.g., Lock and Nguyen 2010; Baer et al. 2013), increasingly a core component of health science curricula, is not generally included in the training of health development practitioners.

### Overestimation of Western Influence

The popularity of global health as a subject of study and public comment, and the dominance of Western practitioners among its key advocates, has created an exaggerated sense of the importance of the West in directing or controlling health outcomes around the world. As mentioned above, the IMF commitment to neoliberal reforms has greatly damaged the health systems of many poorer countries. However, this should not obscure the fact that the contribution of Western aid to health budgets in poorer countries is generally very limited. There are few instances where donor money supports a significant proportion of health needs. In a few isolated cases, external donations comprise up to a half of national health budgets (WHO 2016); however, overall the impact is far more modest. On average, less than 10% of African nations' health budgets came from external sources in 2014 (WHO 2016). The – largely self-serving – overemphasis of donor input and the undervaluing of local health systems and traditional health practices undoubtedly results in loss of opportunities for meaningful, sustainable health system improvement. Indeed, it is likely that a greater focus on support for existing, culturally appropriate, local health systems would enable development health programs to achieve significantly greater impact.

### Overreliance on Statistical Markers of Disease

The current philosophy and ideology of both global health in general and global public health in particular place excessive emphasis on quantitative measures of health. This leads – among other things – to distortions in health programs and to the deskilling of health development workers.

The establishment of an integrated system of concepts supported by an extensive body of "factual data" generated by a well-supported academic industry leaves little room for immersed cultural learning. Working from a deficiency model, statistics are collected, "causes" are identified, and interventions are designed and evaluated, usually with the aim of improving standardized quantitative measures. Health statistics can reveal important features of population health needs and outcomes. However, quantitative measurements always rely on qualitative assumptions about what is worth measuring and how those constructs are interpreted and conceptualized (Bowen 1996), and these constructs can be subject to political manipulation (Kath 2010). By their very nature, quantitative measures reflect averages across selected populations and can often obscure local discrepancies or inequities. Accurate, quantitative variables only represent measurable phenomena and in themselves can provide at best limited

information about causal relationships. Further, the ease of measuring quantitative markers has led to a focus on their use to guide not only global health theory but also the allocation of material resources, even where their limited utility in relation to assessment of desirable health outcomes is recognized. Such important deficiencies are rarely acknowledged.

### Medical Dominance

The conceptual hegemony of medical models of health care has also limited the development of global health and global public health discourses. In development theory and practice, Western concepts of medicine and "health" itself are widely conflated (Clark 2014, p. 1). Critiques of "medical dominance" have a decades-long history (Friedson 1970; Willis 1983) in social science research of health systems in Western contexts (e.g., Willis 2006; Long et al. 2006; Latimer 2013). However, the cultural biases associated with narrowly conceived concepts of health, health care, and "biomedical" science are rarely articulated in development health discourse. Indeed, when questions are raised about the application of Western medical models to non-Western cultures, they often portray the host culture as a problem to be overcome to allow the implementation of valid, "scientific," or "evidence-based" medical care. Rarely is there a genuine questioning of the appropriateness or effectiveness of the particular medical model itself.

Western professional training does not necessarily prepare health-care workers, especially doctors, to be culturally aware, responsive, or adaptable. Doctors, nurses, and allied health workers may be encouraged to reflect on their personal practices, but they also operate within a system where critical reflection on the deeper assumptions underlying their discipline is stigmatized and actively discouraged (Lock and Ngyen 2010). As Lakshmi et al. point out: "A hierarchy of systems of medicine, often unacknowledged, is exercised in most societies, with allopathy at the top, certain traditional, complementary and alternative systems of medicine systems next and local healing traditions last" (2015, p. 1067). Even where value is attributed to such systems and local healing approaches, the latter remain on the periphery. In spite of extensively researched and well-articulated work pointing out the limitations of "evidenced-based medicine" as defined within the conventional Western biomedical paradigm (Feinstein and Horwitz 1997; Greenhalgh 2014; Kirmayer 2012), this ideological construct remains sacrosanct (Lock and Nguyen 2010). As a result, approaches to health and well-being that are not based on Western biomedical science are frequently either dismissed or actively suppressed.

### Cultural Competency

Rather than working with a goal of shared understanding with existing local health systems, and adopting a role of collaborator, the role of development health workers is often assumed to be a superior cultural position that has the beneficent goal of intervening to improve behavior and practice.

The ability to adapt Western-trained technical skills and expertise to local cultural circumstances is often referred to as an important attribute of health workers in general (Purnell 2013). To this end, many nursing and medical courses now include components on "cultural competency" (Kleinman and Benson 2006). However, in practice, the supposed conceptual openness of Western medical science is strictly limited. In addition, the concept of cultural competency, which was originally devised for the purpose of supporting critiques of standards of care offered to diverse, non-dominant populations in Western medical systems, has not been effectively transferred into development contexts. The assumption of a generic "competency" or skill that can be applied across all cultures is in reality merely another version of the Western bias toward universalistic, instrumental characterization of culture and cultural practices (Kleinman and Benson 2006). Rather than generating openness, it can (and often does) serve as a barrier to authentic dialogues across systems of difference, according to which no theoretical assumptions can be excluded from critical scrutiny.

Underlying conceptions of global health – and, a fortiori, global public health – is a confidence in

the assumption that technocratic, instrumentally based modes of thought and action provide benevolent alternatives to the harshness of neoliberal market-based policies. This is expressed through the familiar preoccupations with large-scale public health campaigns – for example, mass vaccination campaigns – which make an important contribution but can come to be seen as all-encompassing solutions which distract from the importance of incorporating local knowledge. It is expressed through the emphasis on pharmacotherapy and "educational" programs to control HIV/AIDS, in the absence of consideration of the importance of the cooperative fostering of community capacity. It is expressed through military-style operations to control and quarantine populations to limit the spread of Ebola virus and other epidemic diseases. It is manifested in campaigns to control obesity and diabetes that depend on paternalistic strategies to direct dietary and lifestyle change rather than addressing the deep cultural, economic, and political roots of unhealthy diets. And it is evident in the reliance on instrumental, positivistic notions of causality in tracing the "social determinants" of ill health and proposing monocausal remedies that often compound the problems rather than ameliorating them.

We note in passing that the regime of "foreign aid" in general is based on the same pathology: that is, the implicit dependence on epistemological and ontological assumptions linked to constructions of Western culture, science, and medicine. Like cultural competency itself, rather than promoting mutual learning and teaching through fluid and open dialogues across cultures and belief systems, it imposes a systematic and impenetrable barrier.

## The Future of Public Health in a Global Era

Although admittedly possessing many positive features, the globalization of public health carries with it problems and dangers. Many of these are common to those encountered by the larger process of the globalization of health and health care. As discussed, these encompass cultural biases and the imposition of Western perspectives on the nature and concept of health in the developing world, as well as assumptions about what constitutes a healthy society and the prices that communities are prepared to pay in order to achieve adequate health outcomes. Also as with global health in general, global public health may be associated with an overreliance on abstract statistical measures of health and disease and on culturally biased tools of analysis.

The globalization of public health also introduces some additional specific risks. As the experiences of Western societies have shown, the institutions and structures of public health are linked directly to the ways in which power is distributed and exercised. The alignment effected by public health of the civil society institutions of medicine and the public apparatuses of authority can be overt, through actions taken by government and enforced by law, or it can be implicit, operating through the educational and cultural systems. The subjugation of medicine to the direct control of public authorities carries significant risks; the exercise of "biopower" also has the capacity to obscure the decisions that may need to be made as traditional societies negotiate their paths to modernity.

As part of the larger project of developing an effective and ethically secure global health methodology, the globalized forms of public health need to find ways of responding to non-Western health approaches while applying the powerful tools of population-scale and evidence-based epidemiological analysis. They need to be able to incorporate local concepts of health and disease and to remain sensitive to community practices and cultural attitudes. And they must take steps to avoid dogmatic applications of decontextualized, universalistic practices and ways of thought. As with global health in general, globalized public health programs need to support local, context-sensitive dialogues within communities that facilitate responses to the complex needs generated by rapid processes of change. These dialogues should seek to ensure the integration of different concepts, epistemologies, value systems, and their practical implications.

Any process of globalization should be subject to a strategy for the conduct of reconciliatory engagements, including those based on communicative discourses and other forms of interaction, and this applies with special force to the application in novel cultural environments of innovative technologies such as those associated with public health. Because of the inherent links between public health and politics, special care needs to be taken, even in relation to apparently neutral and benign programs such as mass vaccination campaigns. As in other contexts of globalization, however, there is no substitute for community dialogues in providing mechanisms for sustainable reshaping of cultural systems and structures of understanding.

The insights and practices of public health offer impressive opportunities for enhancing health and health care at the level of whole populations across the world, but the risks and potential pitfalls associated with them must be recognized and appropriately managed. If this is achieved, public health methodologies realized on a global scale will be able to deliver their intended outcomes of novel, effective practices in settings of a widely supported commitment to change, and respect for local cultures and for those who work within them.

# Globalization and Public Policy

Sharon Andrews and John Whyte
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

## Definition

- Globalization refers to the increased dynamics and complex interdependencies among people, governments, companies, and nongovernment organizations across and between local, national, and international levels. Globalization infers an opening up of perspectives and fields of action.
- Public policy can be defined as purposive action that is ostensibly in the public interest and has been legitimated by governments or quasi-governmental organizations.

## Introduction

Debates regarding the relationship between globalization and public policy engage with the question of how (to what extent/through what means) has globalization impacted public policy and the capacity of the nation-state to set and achieve its policy goals.

More simplistic responses have used the language of global forces and diagnosed a hollowing out of the state marked by a significant diminution of power. While it is clear that the economic, social, and political arrangements and relations that are shaping domestic conditions and outcomes are increasingly supranational, this does not mean that globalization has left the nation-state hamstrung. This misconception is too all encompassing, undifferentiated, and deterministic.

Kennett (2008) notes that states are differently positioned in regard to their capacity to exercise power – both internally and externally – cautioning that even those states able to exercise significant political and economic power are not unchallenged masters of their own and other domains. The global arrangements and relations that shape national and supranational policy goals and outcomes are not static or uncontested nor are they undifferentiated.

Arguably, the most appropriate perspective to take on the impact of globalization on public policy is that it involves processes that are complex, contingent, and ambiguous. Scholars and commentators may be able to pinpoint common themes and pressures but must also recognize that these do not always apply, may have varied effects, and are subject to change. The practices and outcomes of policy activity under the conditions of globalization have to be investigated rather than assumed.

Nonetheless, it is possible to identify a number of key exemplar dimensions with respect to the relationship between globalization and public policy. These dimensions include:

1. Globalization as an imperative
2. Globalization as a source of policy problems
3. Globalization as policy rhetoric/legitimating strategy
4. Globalization as policy opportunity

## Globalization as Imperative

Public policy never occurs in a local vacuum. However, the extent to which policy activity is shaped by global factors depends, in part, on the nature of the policy issue being addressed. Some

policy problems can only be understood and responded to within a globalized frame. For example, some dimensions of corporate tax avoidance are enabled by the capacity of multinational entities to "locate" profits and expenses within those jurisdictions most favorable to their tax minimization interests. In effect, globalization and the more permeable global economic order of contemporary times have provided opportunities for multinational entities to legally avoid paying tax in ways that negatively affect the revenue bases of national governments across the world.

The phenomenon of multinational tax avoidance does not necessarily create a global imperative to act. Some nation-states may be better positioned than others to benefit from profit shifting and tax minimization strategies. Where there is a will to act, globalization becomes a policy imperative, precisely because of the complex interdependencies implicated across and between local, national, and international levels. Multinational tax minimization is an issue that cannot be addressed at the level of the nation-state alone – it requires a global response.

There are numerous other policy issues for which it is imperative that policy actors generate a global response – including drug trafficking, human trafficking, terrorism, irregular migration and refugees, health epidemics, antibiotic resistance, and climate change, to name a few. The consideration common to all such issues is that although the policy responses to these issues are legislated within national jurisdictions, they have to be developed and implemented in concert with others from other policy contexts and arenas in order to be effective.

The imperative to generate such supranational responses to shared global problems has given rise to the concept and practice of global governance. Evans (2009, p. 256) contends that "Global governance refers to the process of political interaction aimed at solving problems that affect more than one state or region when there is no authority structure that can enforce compliance."

Viewed through a positive lens, such global governance can be viewed as a means to provide a negotiated convergence of policy, which allows for ample regulation. Critics, however, contend that such increased policy convergence at the supranational level can result in a democratic deficit at best, or in the worst case scenario, a race to the bottom (Drezner 2001). This latter critique reflects concerns about the outcomes of drastically reduced barriers to economic, political, and cultural exchange that is fundamental to globalization.

## Globalization as a Source of Policy Problems

The consequences of globalization have been hotly debated for decades. Supporters and critics have, respectively, aligned themselves behind claims relating to the positive and negative effects of changing relations and arrangements within the global sphere. Concerns about nation-states' capacities to respond to policy problems have been discussed in the previous section. This section reflects more on the substantive nature of some of the problems associated with globalization. These problems may be economic, environmental, cultural, or social.

### Economic Effects

In economic terms, most of the debate has concerned radical changes to life chances in terms of income inequality and disparities in employment opportunities. In effect, globalization can be broadly understood as contributing to significant shifts in the fate of communities within and across national territories. More specifically, the transnational mobilizations of capital, off shoring of employment opportunities, and international migration of labor have altered, and continue to alter, the distribution of opportunities and rewards for work. The distributional effects of globalization are not universal but are heterogeneous: for some, the effects constitute a change for the better, where others lose what they had previously.

Making sense of these varied distributional effects – both theoretically and empirically – is an ongoing challenge. Researchers have engaged the question of distributional effects at different levels of analysis: micro (kinds of firms/

employees), meso (particular sectors or occupations), and macro (kinds of economies/economic blocks).

For example, an individual positioned within a competitive firm (or one that is sheltered from competition in a particular sector), who has highly developed skills and is mobile, will be more likely to experience globalization as a positive because of their relative employment security, higher wages, and potentially lower prices on the goods and services they seek to purchase. In contrast, an individual positioned within sectors of decline (or companies who are unproductive) and who has less highly developed skills levels may be detrimentally impacted not only by these phenomena but also by competition for jobs through the off shoring or the migration of labor.

Whether such "adjustment" issues are seen as a problem for policy makers depends, in part, on the dominant discourses at play, including whether unemployment is viewed as a temporary outcome. The same is true with debates about rising inequality, with many arguing that poverty should be the issue that policy maker's focus on and absolute poverty should be the lens through which the effects of globalization are judged.

These discourses may seek to discourage an analysis of the relative wins and losses that globalization contributes to at subnational, national, or supranational levels. Nonetheless, it is clear that disparities in income, economic security, and power are contributing to social unrest, dissent, and political action.

## Globalization, Social Cohesion, and Cultural Diversity

Issues of social cohesion have long accompanied the changing nature of national and international relations and arrangements associated with globalization. Questions about globalization and social cohesion are not limited to issues of justice and fairness. For many, changing global relations also put into question social bonds and the ways in which people identify with themselves and others. Under intense processes of globalization, national affinities have given way to more hybrid and plural structures of identity (Scholte 2005).

One example of the possible impact of such plural structures of identify is put forward by Manual Castells (1997), who argues that when the national border loses its significance in terms of providing for collective identification, and the diversity of group identities grow in prominence, nation-states risk fragmentation which has the potential to narrow the prospects for trust, reciprocity, and solidarity. This perspective is useful when viewing, for example, the responses to the global financial crisis (GFC), which has been something of a conceptual lightning rod for social unrest as coalitions of fate and their supporters react to the perceived causes of the crises and the austerity measures imposed in many jurisdictions as a policy response. Social unrest has taken various forms "from riots, strikes and demonstrations, to the 'Occupy Wall Street' movement and its offshoots around the world" (Westaway 2012, p. 136).

With respect to the possible cultural impacts of globalization, the debate is still very much alive. Some commentators argue that new technological and communicative capacities enable cultural differences to be shared, celebrated, and maintained; others are concerned about cultural imperialism and the impact of a Western consumerist culture. This latter position suggests that the rise of the Internet and the spread of cable television has paved the way for the spread of values, norms, and cultural practices that promote Western ideals – particularly those that promote capitalism. Taken to its extreme, some commentators see or predict a global culture dominated primarily by a stereotypical "American" culture.

This concern for cultural homogenization is critiqued as a form of cultural imperialism that manifests in neocolonialism. More recent scholarship (Nederveen Pieterse 2015) argues for a paradigm of hybridity, which would see the development of new mixed forms of social cooperation and trans-local mélange of cultures. This hybridity perspective challenges supporters of the homogenization thesis and those that would catastrophize the prospects for social solidarity in the twenty-first century.

### Environmental Impacts of Globalization

For the most part, environmental concerns have been located within discussions of economic globalization and therefore conceptualized as an outcome of changing economic activity. This has been the site of some of the most contentious debates of our time with significant questions being asked about the compatibility between our current organization and ambitions of the global economy and the sustainability/future of the planet. Questions have also been raised about the efficacy of global environmental governance regimes and their capacity to engage with disparities of power in terms of decision-making as well as injustice in the distribution of benefits and harms associated with different patterns of global resource use (Newell 2012).

The list of environmental problems confronting policy actors at subnational, national, and global levels is extensive and confronting, from the disappearance of entire species to rainforest depletion, degraded farming land, and toxic levels of chemicals within people, locales, and environments, to name a few.

## Globalization as a Legitimating Strategy

Globalization is usually presented and analyzed as a complex set of material practices and processes across local, national, and international levels that give rise to an epochal transformation of contemporary capitalism (Rosamond and Hay 2002). This perceptual approach underpins the examination of globalization in terms of the imperatives it is seen to generate and the outcomes identified as part of the "reality" of a globalizing world.

Rosamond and Hay (2002) point to a discursive element that needs to be addressed over and above any "material reality." Namely, that "it is the ideas that actors hold about the context in which they find themselves rather than the context itself which informs the what in which actors behave" (Hay and Rosamond 2002, p. 148).

In what can be seen as an example of "perception shaping reality," whether policy actors deem globalization to constrain or determine policy prescriptions will matter more than the "truth" or otherwise of this discourse. Because of this, policy makers can find the discourse of globalization useful in mediating tensions that arise in response to policy prescriptions that have negative consequences for constituents of a nation-state. Whether "real" or not, the discourse of globalization may be a convenient "truth" for policy actors seeking to exercise power and maintain electoral support.

In effect, the discourse of globalization can serve as a useful foil for criticism. In the current era in which economic dimensions of globalization dominate, policy makers can take up a Janus-faced positioning, simultaneously arguing that they are subject to external constraints while also claiming credentials as good economic managers. These contrasting positions enable political actors to shift the locus of control for decision-making (and the responsibility for its consequences) depending on the prospects for political fallout or favor.

In this respect, the discourse of necessity associated with globalization – and the way in which it is contested – gives policy makers a forum and form of "plausible deniability" when it comes to the degree of authorship they hold over processes that are reshaping the economic landscape within and beyond their jurisdiction.

Herod (2009) identifies this as happening at the supranational level under the guise of equality and a "level playing field" and further argues that the discourse of equality enables some nation-states to plausibly deny power differentials and authorship of globalizing processes. Herod associates "plausible deniability" by policy makers at the supranational level with neo-imperialism.

The debate on globalization itself can be viewed as providing a repertoire of legitimating discourses for policy makers in warranting their decision-making power. Three dominant discourses have been identified in the literature. The first is a hyper-globalist account that posits that nation-states have "lost power and influence – even 'sovereignty' because they have to (or choose to) tailor their policies to the needs of mobile capital" (Martell 2007, p. 174).

The second is a more skeptical discourse that has responded to the hyper-globalist thesis with

more sober accounts which suggest that globalization is not all that new or truly global. Focusing on empirical evidence rather than abstract theorizing, the skeptics see confirmation of the continuing role of the state within and across national boundaries. Nation-states have gained as well as lost power (Martell 2007). However, this is uneven. As Martell (2007, p. 175) argues, "nation-states retain autonomy and sovereignty in many ways, but unevenly so."

More recently a "third wave" in globalization theory has positioned itself somewhere in between the hyper-globalists and the skeptics. Globalization is not all encompassing nor is it a myth (as some skeptics would suggest). Rather, globalization is an uncertain, uneven, and open-ended phenomenon. Nation-states both contribute to and experience the impact of significant change in the globalizing landscape. The outcome of these changes is not inevitable, predictable, simple, even, or deterministic.

This level of complexity and uncertainty highlights the challenge of making sense of the impact of globalization. It also points to the array of accounts available to policy makers when they seek to articulate and warrant the degree of power they have and their complicity in policy decisions that risk political backlash.

## Globalization as Policy Opportunity

As can be seen in the preceding discussion, the relationship between globalization and public policy can be in a number of ways: as an imperative, source of problems or legitimizing strategy. In addition to these, globalization can also be viewed as creating policy opportunities in terms of policy lessons.

The transfer of policy from one context to another has been conceptualized along a continuum, which places vicarious learning at one end and direct imposition at the other (Dolowitz and Marsh 2000). In other words, some transfers are more voluntary than others.

At the one end of this continuum, the imposition of policy initiatives may be an outcome of globalized power relations and the practices of supranational organizations such as the International Monetary Fund.

Moving along the continuum, more voluntary elements are captured by the concept of "lesson drawing." Lesson drawing means learning from the experience of others. This is a form of vicarious learning that has the potential to inform decision-making across national borders. Policy makers may make use of powerful insights gained by others in terms of "the problems others face, the objectives they seek, the routes they try, the results they arrive at and the unintended results they produce" (Schwille et al. 2007, p. 10).

In effect, the opening up of national borders and the development of global policy networks provide opportunities for policy makers to learn from the lived experience of others. Lesson drawing in a policy sense has the potential to support the diffusion of promising initiatives and reduce the risks of negative unforeseen and unintended consequences.

In practice, however, lesson drawing is complex, often partial, politically invested and no panacea to the challenges of implementing policy that delivers on its intent. Even when not ideologically driven, identifying the potential and limitations of a policy "lesson" can be difficult, as can the enabling conditions that supported success.

In terms of global policy networks, some of their key value lies in their opportunistic nature. Global policy networks tend to arise around areas of shared interest and can address knowledge, capacity, or will issues that may limit the effectiveness of national governments. Streck (2002) identifies a number of key functions of global policy networks:

- The capacity to set agendas by bringing new issues to light or increasing the prominence of an existing policy problem
- Standard setting through the development of "soft" or nonbinding agreements that support transparency and accountability
- Generating and disseminating data and information in a timely manner to support good decision-making

- Boosting the effectiveness and legitimacy of key policy making bodies within member organizations

Global policy networks can also bring together key stakeholders and broker agreements and negotiated outcomes to mediate potential stalemates thus supporting the development and implementation of important policy rationales.

## Conclusion

Making sense of the relationship between globalization and public policy is a challenging endeavor and will continue to be so. The global arrangements and relations that shape policy goals and outcomes both within the nation-state and beyond are not static, uncontested, or singular. In some circumstances, globalization represents a source of policy problems. In other instances, globalization manifests an opportunity to harness collective will, share information or data, and coordinate intervention strategies.

Not all policy actors or institutions are equally positioned to influence or resist policy agendas that have been initiated in transnational settings, and caution needs to be exercised when determining the extent to which a particular policy prescription represents a genuine imperative rather than one that has been named as such in order to garner greater legitimacy.

An increased desire for political legitimacy on the part of national policy makers is understandable in the context of backlash against economic liberalization and some of the social and cultural change that has been associated with globalization. An added difficulty of untangling whether policy initiatives are a genuine imperative rather than a means of foreclosing debate and the prospects of contestation is the self-referential nature of many supranational policy organizations. In many instances, policy makers are party to discussions and decision-making at the supranational level and then responsible for that policy portfolio at the domestic policy level. This dual positioning allows policy actors to manage their proximity to the exercise of political power in terms of the setting of policy agendas.

# Globalization and Public Relations

Krishnamurthy Sriramesh and Neva Štumberger
Brian Lamb School of Communication, Purdue University, West Lafayette, IN, USA

## Synonyms

Public relations and globalization; Public relations in a global world

## Definition

Public relations in a globalizing world is discussed in this chapter.

## Introduction

The term *public relations* usually conjures up pejorative images in the minds of most bystanders because it is seen as a manipulative activity on behalf of powerful interests at the cost of social good. Strategic public relations is far from the Machiavellian practice that is associated with this practice. Public relations has been practiced in different parts of the world for more than 4,000 years, even though in its present form, one can trace it to the latter part of the nineteenth century and the twentieth century. Therefore, this essay has the challenge of synopsizing scholarship that has developed over four decades of a practice that is perhaps as old as the human race. Public relations is better described than defined (McKie and Sriramesh 2017). Even so, public relations scholars have offered dozens of definitions of the term. For the purpose of this chapter, we see public relations as "the strategic communication that different types of organizations use for establishing and maintaining symbiotic relationships with relevant publics many of whom are increasingly becoming culturally diverse" (Sriramesh 2009). Most notable scholarly writings in public relations have appeared only from the late 1970s. The first attempts at conceptualizing what had long been a practically oriented field began with assessments of public relations at the individual practitioner level (roles research) and at the organizational level (models of public relations). These theoretical foundations were further developed in the Excellence study conducted in the late 1980s and early 1990s that assessed "how the public relations function should be structured and managed to provide the greatest value to organizations, publics, and society" (Grunig 2006, p. 153). Although the Excellence study has been hailed for its contributions to the field and other aspects, such as being the largest funded research project in the field, it can also be critiqued for focusing only on three Anglo-Saxon countries: the USA, UK, and Canada. Other perspectives have enriched public relations scholarship, most notably the rhetorical perspective, postmodern perspective, and critical cultural perspective.

At the dawn of the twenty first century, globalization forced the field to expand its horizons from predominantly focusing on American and Western European perspectives to a more global one (Sriramesh 2002, 2010) because organizations – for-profit corporations, not-for-profits, or governments – were forced to make forays into the hitherto neglected markets in Asia, Africa, and Latin America. The need for cross-national communication also provided the catalyst for public relations scholarship to expand its horizons by focusing on public relations practices in hitherto ignored regions of the world such as Asia, Latin America, and Africa. This also resulted in a growth in publications on the topic including books on global public relations (Sriramesh and Verčič 2003, 2009; Curtin and Gaither 2007).

As both public relations scholarship and practice continue to progress, especially in the past two decades, they have encountered particularly new challenges owing to globalization. The world has seen many recent changes such as shifts in the political arena (Brexit, the US elections, and the rejection of established parties in France being the most recent examples), the growth in the influence of international NGOs, spread of social movements, and greater concerns for environmental issues such as climate change. These are

forcing individuals and organizations to recognize the contributions that proactive public relations can make for organizations of all types. This increased demand from practitioners has challenged scholars to conduct research that can result in new and innovative ways of coping with various social, political, economic, and environmental shifts in a globalizing world. Indeed, public relations today might be in the unique position of being able to help organizations cope with this era of rapid globalization, which calls for an ongoing reflection and adaptation in their day-to-day practices. A holistic development of the field and a body of knowledge that is culturally sensitive are direly needed.

We begin this essay by reviewing current public relations literature particularly as it relates to positioning the field to cope with globalization. We then address the issue of ethnocentricity present in both scholarship and practice of public relations, as well as in public relations pedagogy. After providing an overview of some major contributions to the body of knowledge of global public relations, we discuss new opportunities and challenges that await scholars and practitioners and address how they may cope with these challenges in the future.

## Globalization

Globalization is a multidimensional and rather complex concept. With the popularity of this word in the twenty first century, and various notable writings such as Friedman's (2005) book *The Word Is Flat*, this term has been primarily used to explain the diminishing impact of national boundaries, and a shift in power centers globally. It is important to note that globalization is not new to the world because it has witnessed previous eras of globalization (Sriramesh 2010). While there are various definitions of what globalization means, it can be described broadly as the increase in "economic, social, and political interdependencies around the world" (Verčič et al. 2015, p. 785).

Sriramesh (2010) has posited that four factors have played a significant role in the current area of globalization thereby also contributing to the importance of global public relations. The first factor is the increase in democratization around the world that happened predominantly in the second half of the twentieth century. The second is the formation of trading blocks in the final decade of the twentieth century (EU, NAFTA, APEC, etc.) that "increased commercial interactions among countries around the world, leading to increased communication as well" (Sriramesh 2010, p. 693). The third factor is the development and spread of new media and technologies that "have not only provided increased channels for communication but also increased avenues for people to communicate across political and cultural borders, thus increasing pressure on organizations to recognize global voices" (Sriramesh 2010, p. 693). Finally, much of the world seems ready to unite in order to address common problems such as terrorism, environmental issues, nuclear nonproliferation, hunger, and human trafficking. Taking into account the challenges and opportunities of such changes for the public relations profession, it is not surprising that globalization has become an important topic in public relations research in the early decades of this millennium.

It is important to note that whereas globalization has affected public relations, public relations also has contributed to the spread of globalization (Sriramesh 2008). In recent years, scholars have taken into consideration other areas in which the process of globalization has either informed or shaped public relations and vice versa. Globalization has contributed to the professionalization of public relations while also pushing it to expand its horizons beyond the developed West. Yang and Taylor (2014) noted that various networks and systems have been formed as a result of greater and closer connections among practitioners, agencies, and associations, spreading across national borders. Such networks, the scholars suggested, have the potential to "shape how public relations is defined, practiced, and theorized" (p. 509), which may be critical if these networks become too homogenized, with little consideration of local understanding and practices of public relations. In addition, globalization had led to other changes in the profession, such as finding (new) ways for

organizations worldwide to address and meet critical demands by stakeholders, civil society, governments, and other social actors to operate responsibly and ethically sound in their day-to-day practices. For instance, there has been a rise in global standards and initiatives, such as the UN Global Compact, which have set minimal standards to be met voluntarily by organizations around the world.

## Ethnocentrism in Public Relations

The increased nexus between globalization and public relations has brought to fore a deficiency in the field of public relations – its ethnocentricity. Although the field has been making efforts to become more inclusive of diversity, until a decade or so ago, public relations scholarship was too focused on the West and thereby "not ready to help practitioners cope with the opportunities and challenges posed by globalization" (Sriramesh 2010, p. 695). Public relations scholarship has been predominantly based on empirical evidence from Western countries such as the USA, the UK, and Germany (Sriramesh 2002, 2009, 2010). Although public relations was practiced since pre-biblical times outside what is perceived today as the Western world of primarily Anglo-Saxon countries, public relations practice in non-Western national and cultural contexts have been given relatively little attention in public relations scholarship (Sriramesh 2008).

Indeed, one of the major critiques of the current public relations scholarship has been the lack of diversity (Rittenhofer and Valentini 2015; Sriramesh 2002, 2009). Sriramesh (2009) highlighted that globalization in particular has contributed to scholars and practitioners appreciating greater cultural diversity in public relations. He noted that it is critical to define public relations "in a manner that reflects the practice as a global activity involving diverse publics" (p. 2). Moreover, as observed by Rittenhofer and Valentini (2015), there is still little consideration of concepts such as "interdependence," "complexity," and "disembedding" that can help conceptualize "the drivers of globalizing processes" (p. 3). Ethnocentricity is also evident in public relations practice. It is only in recent years that the public relations profession has moved away from solely Western-based professional associations into more international and global ones. Yang and Taylor (2014) suggested that "European influences and regional and global centers have emerged, and these relationships will influence future practices" (p. 523). Public relations teaching and pedagogy have also been marked by ethnocentrism (Sriramesh 2002). Public relations textbooks have been predominantly authored by scholars from a handful of Western countries thereby including information and experiences from a few of these developed countries. Further, in the first 40 years of scholarship, most of the publications in the field focused almost exclusively on corporate public relations (there continues to be such a focus even now) ignoring government and nonprofit organizations (including IGOs, intergovernmental organizations).

## Global Public Relations

The focus of this essay is on the intersection between public relations and globalization, and therefore, it is best addressed in terms of global public relations. In recent years, there has been a growing interest in what has become known as *global* or *international* public relations. Verčič et al.'s (2015) study found that "international public relations is a part of daily business for more than 90 percent of Corporate Communication Officers (CCOs) in Europe, with nearly a quarter of them dealing with 20 countries or more" (p. 787). Not surprisingly, next to "globalization," terms such as "internationalization," "culture," and "intercultural communication" have raised interest among public relations scholars in considering ways in which these concepts could relate to public in a globalizing world (Rittenhofer and Valentini 2015).

With greater spread of globalization, one of the critical concerns among public relations scholars and practitioners has been whether, and how, to find a balance between cultural relativism and a

more generalizable, generic understanding of public relations practice and function across diverse countries and cultures (Sriramesh 2010; Sriramesh and Verčič 2003, 2009). In other words, a multinational organization has to consider whether it will have a one-size-fits-all approach to its global public relations activities or design a unique public relations program for each country where it operates. Obviously, the best approach is to find a middle ground where some aspects of global public relations programs can be centralized, whereas others need to be tailored to local cultures. A multinational study known as the Excellence study (Grunig 2006) offered an approach that blends the *generic* versus *specific* divide, that is, such organizations can benefit from setting some *generic* principles for their global public relations while also implementing these principles locally in different countries based on the *specific* culture (e.g., Likely 2013; Lim et al. 2005; Rhee 2002).

Sriramesh and Verčič (2003, 2009) proposed a theoretical framework for global public relations comprising of five environmental variables that can help multinational organizations set up their global public relations programs: the political system, economic system, media system, activism, and culture (societal and organizational). The basic idea is to bring together "global" and "local" elements to adopt an approach "where some universally applicable principles of public relations are harmonized to develop communication strategies that suit local cultures" (Sriramesh 2009, p. 4). In using the term "cultures," the reference is to the five environmental variables that are also interlinked. A brief overview of these environmental variables is presented next.

**Political system** is a key environmental variable that affects public relations practice in a multinational context. A pluralistic democratic system is a basic ingredient for strategic public relations practice. Public relations involves shaping public opinion, and it can be deduced that pluralistic systems are best able to harness true public opinion while also providing the opportunity to shape it. However, it would be erroneous to assume that public relations only can be practiced in pluralistic political systems. At the other end of the continuum, one finds authoritarian systems that also use public relations for controlling citizens through propaganda. So, on the democracy-authoritarianism continuum, one can find public relations practices ranging from the strategic to the propagandistic. It is to be noted that the democratic-authoritarian continuum is not the only type of political system that is discernible in the world. Other types of political systems such as corporatism, communitarianism, theocracy, and monarchy are evident, and they provide different contexts for the practice of public relations. A global public relations practitioner then needs to have the capacity to contextualize the organization's public relations in such diverse political environments.

**Economic System**: The level of economic development of a country plays a key role in the way public relations is strategized and practiced in that country. Traditionally, highly developed economies have tended to be capitalistic also. More recently, however, China offers an example of a booming economy without political pluralism. Capitalistic economies offer greater competition among investors and that the environment fosters a particular orientation to public relations – more strategic to cope with greater competition. Managed economies, as seen in many developing countries, tend to foster public sector enterprises that are controlled by the government. In such systems, the government becomes the sole public for communication professionals. In this era of globalization, we can discern quite a "leveling of the playing field" with the concentration of economic power shifting from traditional players to some new ones. These changes also have resulted in public relations being called upon to take on newer challenges in new markets. The infrastructure for practicing public relations also has improved in regions outside the traditional public relations power centers in the USA and a few Western European countries. All of these changes have heralded a shift in how public relations is conceptualized and practiced making it much more multicultural.

**Culture**: Edward T. Hall's (1959) famous statement about the interlink between culture and communication is relevant here. Communication

affects culture and culture in turn affects communication. Being fundamentally a communication activity, public relations has an innate link with culture, one that has not been explored much. The nexus between culture and public relations can be discerned in three ways: (a) culture as an antecedent for public relations practice by providing the "environment" in which public relations practice occurs, (b) public relations as an influencer of culture wherein public relations activities have a direct bearing on cultures of societies, and (c) public relations itself as a culture where one can identify public relations practitioners as having a professional culture of their own that distinguishes them from other communication-oriented professionals in journalism, marketing, advertising, etc. Unfortunately, scholarship in public relations has thus far only explored, to a limited extent, the first of these linkages with studies that have mostly used the dimensions of culture offered by Hofstede (1980, 1984, 2001) to explain public relations practices in a few countries. As has been widely critiqued, Hofstede's variables are not comprehensive and do not address *all* aspects of culture, something he himself admitted when he offered the first four dimensions in 1980. Further, he looked for *similarities* across cultures, whereas it is often the *unique* idiosyncrasies of a culture that play a key role in communication and thereby public relations. Public relations scholarship has yet to fully integrate culture into the body of knowledge and thereby is lagging behind in preparing the field for the challenges of globalization. Hofstede's cultural dimensions offer us a glimpse of *societal* culture but *organizational* (*corporate*) culture, which is distinct from societal culture, is equally important, and yet underrepresented in public relations scholarship.

**Media Systems**: Around the world, there is an assumption, albeit an erroneous one, that public relations only involves maintaining relationships with journalists on behalf of the organization – popularly referred to as "media relations." This assumption stems from the fact that public relations practitioners frequently use mass media as conduits for communicating their messages. Given that the mass media are such an important "public" for the field of public relations, it behooves us to address the mass media as an "environmental variable" that should be taken into account when discussing public relations in a global context. Until about 15 years ago, public relations scholarship had not addressed the different media environments that public relations practitioners need to contend with at all. Again, it should be noted that globalization has spurred public relations scholarship into giving greater importance to learning about the different media environments in different regions of the world. The normative theories of the mass media first introduced by Siebert et al. (1956) and then further refined by a variety of scholars in the 1970s and 1980s help us understand the different functions of the mass media in different political and economic systems. Almost 50 years after Siebert et al.'s seminal work, Hallin and Mancini (2004) offered a review of media environment in 18 European countries. With the onset of information and communication technologies (ICTs) and social media, different challenges have been posed to public relations practitioners who now have to balance *traditional* (print and broadcast) media as well as *new* media consisting of ICTs and social media and what Castelló et al. (2013) called "networked societies."

**Activism**: Except in the most repressive political systems, organizations around the world have to be responsive to activist pressure. Especially corporations often are challenged by activists when they are disenchanted with the negative consequences that corporations have on society. Activist pressure usually brings with it reputational consequences because activists usually seek the mass media as allies, and therefore, organizations seek help from public relations especially during such times. Activism adds to the dynamism of the organization's environment by creating pressure points in the public sphere. Activists, therefore, create opportunities for public relations professionals. In a global setting, the complexities of dealing with both domestic and international activist groups increase the challenge both for the organization and for the global public relations practitioner (Kim and Sriramesh

2009). Of course when one combines this environmental variable with particularly two others discussed above – political system and media system – the blend can be a potent reputational pressure point for organizations of all types.

Thus, it is important to reiterate that the five environmental variables are not discrete but very interdependent (Sriramesh and Verčič 2003, 2009). We have argued in an earlier essay that "political economy affects, and is affected by, societal culture just as media culture is affected by, and affects, societal culture, political culture, and economic culture. In other words, these variables are interrelated influencing each other but important enough to be studied individually in order to expand the body of knowledge" (Sriramesh and Duhé 2009, p. 368). It makes eminent sense to broadly define the term "culture" in this context, going beyond the anthropological notions of the term. Therefore, being sensitive "to diversity in culture, political economy, media system, and activism" is then not only needed in the context of global(izing) world – rather, it is "fundamental to every public relations enterprise... Only then can the profession and scholarship move away from the ethnocentricity that currently exists and make the profession more holistic and far more effective than it is today" (Sriramesh 2008, p. 423).

## Conclusion and the Future

Over the last four decades, the body of knowledge of public relations has grown from strength to strength. For a predominantly practice-oriented domain, this has been a welcome development because scholarship can help enhance practice. However, the field had remained largely ethnocentric until the turn of the millennium when the field has been enriched by more international perspectives. The past 15 years have seen a significant broadening of the horizons of the field owing principally to globalization. However, the glass is only half full, and there is a need for greater integration of global perspectives into both the body of knowledge and practice. Among other things, there is a need for scholars to empirically link the five environmental variables discussed here with public relations practice. Such evidence will help us *predict* which public relations strategies and techniques are optimal in certain cultures and thus be immensely helpful to practitioners who are coping with globalization either based on trial and error or anecdotal evidence.

There is also a need to empirically study the role of public relations in society. As mentioned earlier, public relations has an impact on the cultures of the world but such impact has not been studied empirically by public relations scholars. What contributions, positive or negative, is public relations practice having on the world? Further, the relationship of public relations to economic and power structures of different societies and political and economic systems is yet to be empirically studied. Public relations scholars also need to study some of the big issues facing the world such as those raised by the business leaders, think tanks, and politicians at the World Economic Forum. The implications of globalization, interdependence, and interconnection – going beyond social media networks – global shifts in power and complexity and the concomitant fallout such as the potential for intergenerational conflict, security, and resource wars and the inability of nations and organizations to deal with these issues offer opportunities for research. These issues have real impact on the lives of our practitioner colleagues who struggle with the implications of the ongoing economic crisis in Europe and the USA and the worldwide accountability and increasing youth and political activism.

Empirical evidence also needs to address public relations itself as a *culture*. Is it the remit for public relations to be a "hired gun" representing only corporations? This essay wishes to dispel such a myth. However, more evidence is required to establish the "social good" that can emanate from strategic public relations practices. So, we need evidence to establish public relations as a builder of communities, as an aid for national development and perhaps even nation building rather than a Machiavellian practice that does more harm than good to societies. Public relations

has played a role in all these desirable activities but those have just not been chronicled so far and need to be. NGOs "have become influential actors in creating awareness of international social, political, environmental and economic causes in global society" (Schwarz and Fritsch 2014).

Another important question is the applicability and relevance of the existing body of knowledge for government public relations. Public diplomacy, a segment of government communication, has received significant attention among public relations scholars in recent years. Yet, there has not been adequate chronicling of the nexus between public relations and public diplomacy, including cultural diplomacy. The overlap between public diplomacy and public relations is vastly underexplored by scholars even though it exists.

The current dynamism in the global environment has important implications for public relations practitioners. As Verčič et al. (2015) noted: "Diversity and international experience are keys for recruitment and composition of communication professionals in corporate headquarters as well as in decentralized communication teams" (p. 791). In fact, their study found that more than 90% of the CCOs in Europe in their sample experienced international communication routinely with nearly a quarter of them interacting regularly with more than 20 countries. Although "domestic" public relations (defined as public relations practiced within national borders) is not dead, it has certainly changed from what it used to be until the dawn of this era of globalization becoming ever more cross-cultural. In essence, globalization has transformed public relations practice making it truly intercultural and complex.

## Globalization and Sex Trafficking

Kaye Quek
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

Globalization, in its various manifestations, has both increased the incidence of sex trafficking to an unprecedented extent and fundamentally altered the form and process that contemporary sex trafficking takes. The enormous expansion of the sex trafficking industry can be directly traced to growing conditions of inequality created through policies of economic globalization, in particular trade liberalization, privatization, and reductions in state welfare services, which have characterized the global spread of Western capitalism since the 1980s. Technological advancements, especially in the areas of communication and transportation, resulting in the freer movement of people and capital, have further aided the exponential growth of the international sex trade. This entry documents how economic, political, and sociocultural aspects of globalization – taken here to mean the processes of growing interconnectedness between individuals, groups, and institutions worldwide – create push-pull factors that enable the crime of sex trafficking to flourish. It highlights the specific role of neoliberal or free market policies in contributing to the proliferation of sex trafficking internationally and the challenges that a globalized sex trafficking industry presents to states and international political institutions.

### The Crime of Sex Trafficking in the Era of Globalization

Sex trafficking, a modern form of slavery and sometimes known as sexual slavery, is the crime of recruiting, transporting, and/or receiving persons for the purposes of sexual exploitation. While most victims of sex trafficking are traded into brothel, street, or escort prostitution, others are exploited in different sectors of the commercial sex industry including pornography, in massage parlors, in strip clubs, and on sex tourism websites. Typically, traffickers recruit victims through false promises of work abroad or in another city or town. Victims leave their homes because of poverty, a lack of employment opportunities, or in search of the more affluent lifestyles of developed countries, only to find themselves indentured in situations of sexual slavery. The illicit nature of the crime makes it difficult to accurately identify the number of victims trafficked for sexual exploitation each year; however, estimates by major international organizations range from 600,000 to 4 or 5 million annually. Women and girls make up the vast majority of sex

trafficking victims, although men and boys too are victims of the crime.

Trafficking for the purpose of sexual exploitation is the most common form of human trafficking in the world, accounting for approximately 80% of all cases of trafficking in persons. The predominance of sex trafficking among the various forms of human trafficking is reflected in the only international legal definition of the crime. The UN 2000 Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (also known as the Palermo Protocol), establishes sex trafficking as a crime in international law and lists sexual exploitation first among the different purposes for which a victim may be trafficked (United Nations 2000, Article 3a). Importantly, the protocol does not distinguish between situations of trafficking involving the overt use of physical force or violence and those in which a victim has "consented" to be trafficked (United Nations 2000, Article 3b). The irrelevance of consent is significant to understanding the role of globalization in creating conditions of inequality which leave millions of women and girls worldwide vulnerable to being trafficked for sexual exploitation.

The crime of sex trafficking operates as a truly global phenomenon, with every country in the world affected as a point of origin, transit, or destination. Although pattern variations exist, victims tend to be recruited from economically poor regions of the globe and transported for exploitation to wealthier and more developed areas. In any one case of sex trafficking, there may be a number of actors initiating or facilitating the process across several locations, including the recruiters and traffickers themselves as well as corrupt police, border and law enforcement officials, organized crime syndicates, pimps, and brothel owners. The contemporary industry operates as a significant element of the global economy, with annual profits of the crime worldwide estimated to be in the tens of billions of US dollars.

Sex trafficking is not a new phenomenon; however, there are several factors that distinguish the globalized sex trade of today from those of earlier eras. The scale and form of the contemporary industry are of particular significance. Globalization has not only facilitated the expansive growth of the trade but has transformed the very processes of sex trafficking itself. Macroeconomic policies of trade liberalization and privatization in the developing world have created enormous populations of impoverished women and girls seeking improved economic opportunities elsewhere and vulnerable to the promises of traffickers. At the same time, technological advancements in communication and transportation have increased the speed and capacity of traffickers to transport victims en masse, making the practice of sex trafficking easier as well as more sophisticated, profitable, and geographically diverse than at any other points in history. The extent to which contemporary sex trafficking relies on the macrostructural elements of globalization has led scholars to argue that the crime exists not merely as an *outcome* of globalization but as *an aspect* of the process of globalization itself (e.g., Bales 2012; Clark 2003).

## Creating Supply: The Effects of Economic Globalization on Sex Trafficking

The worldwide proliferation of sex trafficking since the mid-1980s can be attributed in large part to the processes of economic globalization that took place in the same period. Economic globalization is taken here to refer to the spread of Western-style capitalism that occurred throughout the world during the 1980s and 1990s and is characterized by an emphasis on neoliberal or free market economics including trade liberalization, increased foreign investment (especially in developing countries), rapid privatization, and fiscal austerity principally in the form of cuts to social security. In her work *Sex Trafficking: Inside the Business of Modern Slavery*, Siddharth Kara (2009) explains how the enormous expansion of the sex trafficking industry is a direct result of the processes of economic globalization. While the global integration of markets and economies brought benefits to some in the developing world, its corresponding effect has been to greatly increase global slavery by exacerbating rural poverty, expanding the gap between rich and poor,

creating social instability, and facilitating the transfer of wealth and resources from poor economies to wealthy states. In the context of these conditions, women and girls are especially vulnerable to being exploited in sexual slavery due to the uneven and gendered consequences of neoliberal economic restructuring which result in women being disproportionately represented among the poor in a society, a phenomenon known as the feminization of poverty.

The transitions of former communist countries in Central and Eastern Europe to market economies illustrate the role of economic globalization in fueling the problem of sex trafficking. With the fall of communism, states in the region sought to restructure their economies to reflect Western free market capitalism by engaging in massive privatization initiatives, market liberalization, and substantial reductions in social welfare services and provisions. International economic governing bodies, in particular the International Monetary Fund (IMF), were in large part responsible for driving the changes by mandating structural adjustments in affected countries as a condition of lending. The rapid implementation of neoliberal economics led to unprecedented levels of poverty and unemployment in many former Soviet states, with women disproportionately bearing the burden of the transition to capitalism. Where women had previously been used to both working and raising children under communism, supported by a generous welfare state, they came to represent the vast majority of those unemployed and living in poverty with the shift to free market economies. In many former Soviet countries, women comprised 70% of the newly unemployed labor force, creating a boon for traffickers. Economic globalization had a direct role in the upsurge of sex trafficking by creating populations of women and girls living in poverty, searching for better economic opportunities abroad and susceptible to the false promises of traffickers. Today, countries in Central and Eastern Europe remain among the largest source countries for the sex trafficking industry.

The spread of free market capitalism to other regions of the world further attests to link between economic globalization and the proliferation of sex trafficking. In South and East Asia, economic restructuring in line with IMF requirements involving the liberalization of trade and markets, and significant privatization of public resources, has destabilized previously agrarian societies and subsistence economies. Throughout the region, rural poverty has worsened considerably as the introduction of large sums of foreign capital disrupted local forms of production and shifted the focus of state economies to large-scale production in urban centers. The destruction of agricultural land and the privatization of public resources such as water affected women in particular who formed the majority of laborers in the rural agricultural sector. In the context of these conditions, women become vulnerable to traffickers on two fronts: firstly, as a result of their loss of subsistence income and increased impoverishment and secondly, as they migrate in search of new opportunities in emerging urban areas. Traffickers are able to prey on women's economic desperation and isolation from support structures that existed in their home communities. The effect of economic globalization on sex trafficking is in this way twofold, as the shift to free market economies serves to exacerbate female impoverishment while holding the promise of improved economic prospects elsewhere (Purkayastha and Majumdar 2009).

## Fueling Demand: The Intersecting Effect of Economic and Sociocultural Globalization on Sex Trafficking

The exponential growth of sex trafficking in recent decades cannot be explained alone, however, by the supply of impoverished women and girls created by the implementation of neoliberal free market policies worldwide. Rather, the predominantly male demand for the international sex industry is integral to the current magnitude of the sex trafficking trade, and in this, the combined effects of economic and sociocultural forms of globalization play a crucial role. The widening disparity between the rich and poor within countries, as well as between states, is significant in accounting for the enormous demand that fuels

the international trade in sexual slavery. The uneven consequences of economic globalization mean that, at the same time as the spread of free market capitalism has increased the global poor, it has created affluent middle and upper classes possessing greater capital than before with which to buy sex from trafficking victims. Developing countries themselves, and international economic organizations such as the IMF and the World Bank, are also complicit in fueling the demand for sex trafficking by encouraging sex tourism as a development strategy. In countries such as Thailand, sex tourism was explicitly promoted by the state as means to attract foreign capital and increase gross domestic product (GDP). The demand created by these initiatives was met by traffickers, with Thailand emerging as a major hub of trafficking for sexual exploitation in the region.

Economic globalization is further implicated in facilitating the male demand that underpins sex trafficking through the consumer culture that it fosters. Under the free market economic principles of neoliberalism, everything and anything becomes marketable and consumable, including women and children as sexual commodities (Poulin 2003). The growing economic inequality between countries, as a consequence of global capitalism, is equally significant as men from the developed world possess the financial capacity to travel internationally to engage in sex tourism industries supplied with trafficked women. The directional flow of supply and demand in the sex trafficking trade reflects global economic inequalities exacerbated by the spread of free market capitalism, with trafficked women coming from the Global South and male demand originating predominantly from the Global North. The regions of North America and Western Europe, as well as countries including Japan and Australia, are among the largest users of trafficked women.

Structural inequalities heightened by processes of economic globalization intersect with elements of social and cultural globalization to actively encourage male demand for sex trafficking. The transformation of communication that emerged with the technological advancements of globalization is especially significant in this regard. Through the Internet and worldwide dissemination of mass media, trafficked women and girls are promoted as sexual commodities available for consumption by male buyers across the globe and especially those in industrialized states. Gender and economic inequalities overlap with racial and ethnic power imbalances in these mediums, as trafficking victims are advertised in specialized, segmented markets according to racist stereotypes of women in the developing world. Asian women, for example, are frequently represented as pliable and willing, while women from Eastern Europe are promoted as sexually forward and inviting. Through technologies that enable real-time social interaction and global connectivity, male buyers across the world are able to visually and virtually consume trafficked women who are in a different geographical location, while the medium at the same time acts as a broader marketing tool for international sex tourism. The rapid and widespread circulation of images of women as sexual commodities, enabled through channels of sociocultural globalization, has proven invaluable to traffickers who rely on such mechanisms to generate demand.

The normalization of international sex tourism itself can be identified as an additional factor sustaining the global demand for sex trafficking. In the same period that sex trafficking has flourished, so too has the business of international sex tourism. No longer occupying a marginal place in the global economy, the sex industry, in both its legal and illegal forms, has increasingly emerged and been cast as an ordinary sector of the economy, generating billions of US dollars in profits. The strategic positioning of sex tourism as a valuable and viable source of income for developing countries, noted earlier, is exemplary of this trend. With a flourishing sex industry, states stand to gain revenue not only from the purchase of trafficked women in sexual exploitation but from male buyers' use of hotels, airlines, restaurants, and other services in the course of their travel. The globalization of the sex industry is thereby implicated in facilitating the demand for sex trafficking by normalizing the treatment of women and girls as sexual commodities.

## Globalization and the Changing Form and Process of International Sex Trafficking

The effect of globalization on sex trafficking is not limited to factors resulting in the quantitative increase of the crime but extends to the very nature of contemporary sex trafficking itself. That is to say, globalization has *qualitatively* transformed the form and process of the current day trade in women for sexual exploitation. Economic globalization, for instance, has internationalized the allocation of profits deriving from sex trafficking. To the extent that the spread of global capitalism has facilitated the free flow of capital and finance, it has also allowed for financial gains from the industry to be dispersed worldwide among a range of actors including international crime syndicates as well as corrupt government agents and officials who are complicit in the trade. Technological developments in finance, most notably the digital transfer of capital, have aided this trend. Advancements in communication and transportation, as forms of social and cultural globalization, are equally significant. Global competition creating cheaper options for travel both within countries and across borders, coupled with technologies allowing for the faster, larger, and further movement of peoples, has profoundly altered the business of sex trafficking. Through such technologies, sex trafficking has transcended its earlier, more limited structure, to take on new global routes and facilitate the macro-movement of women and girls for sexual exploitation. The outcome is a far more sophisticated and profitable sex trafficking industry that goes beyond the local to take on a truly global form.

Processes of sociocultural globalization have, in particular, increased the ease of the activities of sex traffickers. New digital technologies such as cell phones allow traffickers to easily communicate with women they have indentured in sexual slavery as well as with customers and fellow traffickers, while facilitating their capacity to track and monitor victims under their control via Global Positioning System (GPS) functions. With access to a thriving market in relatively inexpensive cell phones and telecommunication services, traffickers can simply replace the phone they are using should they fear being traced by authorities. The Internet, too, has fundamentally changed the nature of contemporary sex trafficking. It not only forms a key space for the international marketing of commercial sex (discussed earlier) but provides new means with which to recruit victims, such as through social media, and with which to sell victims, such as in online pornography. Traffickers engage in online communication to connect with one another, operate their networks, and identify new locations from which to source sex trafficking victims and potential routes for transfer. Online functions relating to transportation, for instance, the capacity to buy aeroplane, boat, or train tickets via the Internet, further streamline the work of traffickers. Through such legal channels, sex traffickers can coordinate several of the logistical elements of their illegal trade with a lesser chance of detection by officials. Elements of political globalization, namely, in the form of less stringent immigration controls and more porous borders in unified economic regions, intersect with these aspects of social and cultural globalization to minimize obstacles to the crime of transporting victims for sexual exploitation. The increased and freer movement of people worldwide provides traffickers with greater cover for their acts and creates new challenges for detection. As a result, the crime of contemporary sex trafficking operates on a different scale and platform to those of earlier eras.

## Challenges to Combatting Sex Trafficking in a Globalized World

The processes of globalization present very significant challenges to efforts by states, international political institutions, and nongovernmental organizations (NGOs) to combat the international trade in sexual slavery. In the first place, sex trafficking today more often than not cuts across issues of national sovereignty. In the age of globalization, a single act of sex trafficking may involve citizens from multiple states and traverse numerous geographical locations, involve

financial transactions across different countries, and be subject to the laws of several jurisdictions. More so than ever before, the practice is likely to involve a diverse range of actors and places, which create difficulties in regard to data collection, detection, law enforcement, and prosecution. Related to these issues is the absence of coordination and, often, cooperation among states to effectively address the crime. Information sharing between countries is frequently hampered by political stonewalling, claims to sovereignty, and bureaucratic delays. In other cases, attempts to prosecute sex traffickers collapse in the absence of extradition treaties between states (Kara 2009). The extent to which the international community struggles to overcome such issues of national sovereignty stands in contrast to the highly globalized nature of the crime of sex trafficking itself.

Perhaps the single largest challenge to international efforts seeking to address the trade in sexual slavery is the widespread involvement of organized crime in the contemporary industry. With the advent of new technologies facilitating the globalization of the crime, trafficking has emerged as the third largest business for organized crime groups, behind only drugs and arms trading (UNRIC 2016). The participation of international organized crime in the industry is both complex and sophisticated. While not all cases of sex trafficking involve established criminal networks (a significant amount remains the work of individual criminals), those that do benefit enormously from the level of coordination and logistical support that international crime syndicates bring. This includes the capacity to traffic large numbers of women alongside illicit drugs, weapons, and other human beings destined for exploitation in forced labor. More so than individual traffickers, organized crime syndicates are able to adjust trafficking routes or methods of transportation should they find that authorities have blocked a particular pathway. Criminal groups from different countries frequently work together by overseeing different stages of the trafficking process or by renting out locations to one another for victims to be lodged or exploited in and then sharing the profits from the sexual exploitation of victims. The larger criminal networks also possess the capacity to set up fake businesses with which to recruit victims and/or use as a cover for their criminal activities in the sex trade. Equally, they remain better placed than small-time traffickers to procure or create false documents to facilitate the transportation aspect of sex trafficking. The broader challenge facing the international community is the capacity for organized crime to circumvent obstacles to the trafficking process when they arise, including those specifically aimed at deterring the crime by state authorities and international organizations.

The pervasive occurrence of official corruption, which is characteristic of present-day sex trafficking, compounds the problems created by the large-scale participation of organized crime. The exponential growth of the trade since the 1980s could not have taken place without the knowledge and complicity of state officials, ranging from police officers and border and customs authorities to ambassadors, judges, and political parties. Most often the corrupt behavior of officials in regard to the sex trade involves accepting bribes from traffickers in exchange for turning a blind eye to the crime in brothels or at border crossings or for warning criminal groups when investigations at the sites of women's exploitation are imminent. In more high-level situations, prosecutors and judges engage in corruption by seeking or handing down lesser penalties than those associated with trafficking for a one-off payment or longer-term share in the revenues. The intimacy and overlap between organized crime and official corruption in the sex trafficking trade is considered by many experts to be crucial in accounting for the health and unprecedented growth of the industry (e.g., Clark 2003; Kara 2009; Shelley 2010).

A further obstacle faced by states and international organizations attempting to combat the crime is the enormous profits that sex trafficking creates for traffickers in the era of globalization. Kevin Bales (2012), in his work *Disposable People: New Slavery in the Global Economy*, observes that a key difference in slavery between the present day and earlier eras is the fact that slaves are no longer a long-term investment but can be procured cheaply and are easily replaced.

The result, in the context of sex trafficking, is a profit margin greater than those of many of world's most commercially successful multinational businesses (Kara 2009). As potential victims are in plentiful supply due to increasing global inequalities resulting from the spread of free market capitalism, and technological developments and global competition in transportation industries have driven costs down, the expenses for traffickers are incidental compared to the revenues that the crime generates. If a victim should die during the process of transportation, they can be replaced with another trafficked woman at minimal inconvenience to the trafficker. The system of debt-bondage is another factor that distinguishes contemporary sexual slavery from earlier slavery practices and increases the profitability of the trade. Debt-bondage is the arrangement by which women are made to pay off an alleged "debt" to traffickers for their travel and living expenses through the sexual servicing of male buyers for little or no payment from those controlling them. In traditional slavery, the costs of enslavement were the onus of the slaver owner, whereas through debt-bondage sex trafficking victims are made responsible for the costs of their subsistence. In these conditions, there is little incentive for traffickers to cease engaging in the crime – despite the financial and incarceration related penalties associated with sex trafficking – because the risk is so far outweighed by the financial reward.

## Political Globalization and International Efforts to Address Sex Trafficking

Although the challenges to combatting a globalized sex trafficking industry are considerable, recent years have seen the emergence of an international community – made up of states, supra-state institutions such as the UN, and international NGOs – seeking to meaningfully challenge the trade and to support victims. In this sense, while globalization has undoubtedly been crucial in enabling the vast expansion of the sex slavery business, so too has it raised international awareness of the problem and underpinned efforts to create global solutions. Increasingly, the international mass media have played a critical role in the struggle against sex trafficking. Through the creation of documentaries, special news reports, and investigative journalism, the media have employed the many channels of globalized communications to great effect to inform individuals and societies of the devastation and human rights abuses that sex trafficking entails for its victims.

In recent decades, international humanitarian groups and NGOs, as an aspect of global civil society, have also taken on an evermore sizeable and important function in the fight against sex trafficking. The roles performed by international NGOs in relation to sexual slavery are diverse and vary significantly from group to group. While some organizations engage exclusively in victim-support, for instance, in relation to housing, resettling, and legal and counseling services, others focus their efforts on raising awareness and much-needed funds in the wider global community and especially in developed states. As many organizations conduct their work "on the ground" (i.e., in countries and locations where recruitment, transportation, or the sexual exploitation of victims is occurring), they have come to be recognized as key actors in the struggle against sex trafficking. This is due to their knowledge gained as a consequence of groups' proximity to where the abuses are taking place and in light of their interactions with victims and sometimes traffickers themselves. In many cases, NGOs take on the role of a "watchdog," observing the extent to which programs and policies directed at combatting sexual slavery are operating as planned. Based on their firsthand knowledge, many organizations have expanded their activities to include research and policy development, as well as advocacy, in an effort to support governmental efforts to combat the industry.

At the level of international multilateral governance, major initiatives have been developed, especially through the UN, in an attempt to stem the trade in women and girls for sexual exploitation. The most significant of these is the creation of the 2000 UN Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women

and Children. As noted earlier, the protocol identifies sexual exploitation first among the differing purposes for which human beings may be trafficked. As an instrument of international law, it is notable for establishing, for the first time, an international legal definition of the crime of trafficking in persons and enjoys widespread acceptance having obtained 117 signatories since it opened in Palermo, Italy, in December 2000 (UNTC 2016). The protocol enumerates the major goals of state parties. These are to engage in prevention and prosecution in relation to human trafficking and to provide victims with protections. The significance of the protocol lies in its role in clearly elevating sex trafficking (and other forms of trafficking in persons) to a global political issue, requiring action from all affected international actors in order to be meaningfully addressed. The treaty sits among a suite of measures undertaken by numerous UN agencies and regional political and governmental organizations to tackle sex trafficking. Examples include legislative initiatives, media campaigns, as well as improved law enforcement and border control.

A major criticism of existing international responses to sex trafficking is their failure to adequately account for the broader structural inequalities resulting from economic globalization in particular, which render millions of women and girls vulnerable to being trafficked for sexual slavery in the first place. Jacqui True (2012, p. 69) makes this point in her work *The Political Economy of Violence Against Women* where she argues that "[t]reating trafficking as a criminal justice issue has become the dominant international approach," rather than "addressing the gendered social and economic inequalities that feed trafficking" which remains the larger problem. At the same time, states' efforts to implement the UN trafficking protocol remain uneven, with many emphasizing the prevention and prosecution aspects without meaningfully attending to the protection element, which requires state parties to treat trafficked persons as victims of a crime and not as criminals themselves. In some jurisdictions, victims' reluctance or refusal to assist with prosecutions results in their being treated as an illegal immigrant and the subsequent refusal of services followed by deportation. On the whole, the international community has enjoyed much success in fostering a climate in which sex trafficking is widely recognized as a devastating abuse of human rights. However, significant questions remain not only in relation to the treatment of victims by states but in terms of extent to which current initiatives can effectively halt the crime in the absence of measures which address its root causes.

## Conclusion

The effect of globalization on sex trafficking has been to facilitate the enormous growth of the crime in recent decades and to profoundly alter the processes associated with the business of sexual slavery itself. Economic globalization, with its uneven and gendered consequences, has created unprecedented numbers of impoverished women and children vulnerable to being exploited by traffickers in prostitution and related industries. Qualitatively, sex trafficking has been transformed by elements of social and cultural globalization, such that the contemporary trade operates on a larger and more efficient scale than ever before. Processes of globalization have also resulted in new and significant challenges to effectively combat the crime, including increased corruption by officials and the widespread involvement of international criminal networks. These are in addition to obstacles created by issues of state sovereignty and growing profit margins for traffickers that far overweigh existing penalties. Forms of political globalization have initiated a great number of measures to combat sex trafficking, and although these are in no way insignificant, it remains to be seen how effective they can at dismantling the international trade in sexual slavery without addressing the structural and gender inequalities that underpin the crime. With millions of women worldwide being treated as little more than sexual commodities, it is vital that the international community continues its efforts to fight the globalized traffic in women for sexual exploitation.

# Globalization and Strategic Security

Joseph M. Siracusa
RMIT University, Melbourne, VIC, Australia

Concerns with terrorism, nuclear proliferation, and war dominated America's first decade of the twenty-first century. The nation's worldview was conditioned by the threat of global terrorism and fear of weapons of mass destruction in the hands of Iraq, Iran, and North Korea. President George W. Bush rallied the country after 9/11, helped develop an international network to thwart terrorist threats, and invaded Afghanistan and Iraq – the latter with the hope of spreading democracy throughout the Middle East. In dealing with Iran and North Korea, he engaged in various economic sanctions and antimissile systems designed to destroy incoming ballistic missiles. His missile defense program, however, was seen in Moscow and Beijing as being put in place to diminish their deterrent forces. Upon his departure from office, American military and foreign affairs were in considerable disarray.

President Barack Obama inherited tense relationships with both China and Russia, a need to negotiate a new treaty with Moscow reducing nuclear-tipped missiles, review the antimissile system, withdraw forces from Iraq, and bolster Afghanistan's inept government. Then, too, he faced other dilemmas: What to do with an Iranian government that might be building a nuclear weapon? How does one deal with a nuclear endangered South Asia? And what position should the United States take during the Arab Spring?

## Focus on Iraq

Presidential campaigns during 2000 set the stage for renewed conflict with Iraq. Vice President Albert Gore, the Democratic nominee, defended the Clinton record on Iraq but added: "I want to go further. I want to give robust support to the groups that are trying to overthrow Saddam Hussein." George W. Bush, the Republican nominee, declared, if as president he found Saddam manufacturing weapons of mass destruction, he would "take him out." Later, he warned on TV's Jim Lehrer News Hour: "If we catch him developing weapons of mass destruction in any way, shape, or form, I'll deal with that in a way that he won't like." Republican vice-presidential candidate Richard (Dick) Cheney warned that if Saddam considered possessing weapons of

mass destruction, "we'd have to give very serious consideration to military action to stop that activity."[1] The Republican platform strongly endorsed the Iraq Liberation Act. Some State Department officials favored new sanctions, but nowhere did the 2000 campaign resolve the question of Saddam's future. But George W. Bush's election would.

Many in the new Bush administration shared the muscular and unilateralist vision of the country's leading neoconservative pundits who advocated expanding the world's democratic arena with displays of US power. Charles Krauthammer, columnist for *The Washington Post*, demanded a "new unilateralism" that sought to "strengthen American power and unashamedly deploy it on behalf of self-defined global ends." Among those who dominated the new administration were self-defined neoconservatives such as Paul Wolfowitz, Deputy Secretary of Defense; Douglas Feith, Under Secretary of Defense; Richard Armitage, Under Secretary of State; and Condoleezza Rice, National Security Adviser. The administration's dominant spokesmen, Vice President Cheney and Secretary of Defense Rumsfeld, were not neocoms but rather assertive nationalists driven by perceptions of danger to US security. What rendered such distinctions irrelevant was the general agreement within the new administration that Washington pursue an aggressive foreign policy against the world's unacceptable regimes, based on incontestable military power and a readiness to use it. Only Colin Powell, the new Secretary of State, was reluctant to endorse the administration's assertive outlook on world affairs.[2]

As the curtain opened on the new administration, Iraq held center stage. At the initial meeting of the new National Security Council on January 30, 2001, there was a high degree of agreement that Saddam needed to go. Leading the anti-Saddam crusade were Wolfowitz, Rumsfeld, and Cheney. Critics noted the failure to uncover any Iraqi weapons program – the sole rational of the demand for action. But toppling Saddam found no consensus in the vast majority of the American people, no less than the world, generally. Iraq largely remained a dead issue.

## 9/11 Terrorist Attacks and Afghanistan Invasion

Plans to remove Saddam's regime were interrupted by the September 11, 2001 terrorist attacks on New York and Washington. The president declared that: "Those who make war on the United States have chosen their own destruction.. . . We will find those who did it. We will smoke them out of their holes. We'll get them running, and we'll bring them to justice." Even Russia's President Vladimir Putin condemned the attacks, defining them as "a blatant challenge to humanity." Britain's Prime Minister Tony Blair declared mass terrorism the new evil in world society, one "utterly indifferent to the sanctity of human life." Some Europeans hoped that the United States, in its pursuit of vengeance, would not push the world into a spiral of uncontrolled violence. Throughout much of the undeveloped world, however, the reaction to the 9/11 attacks was unsympathetic for they understood that Arab hatred toward the United States had driven the attacks. To many Arabs, the United States was an alien, oppressive, and corrupting influence throughout the Middle East. But most of the hatred flowed from the perennial US support of Israel. For Bush, however, Arab hatred of the United States lay not in what America did but in what it was. "They hate our freedoms," he told a joint session of Congress on September 20, "our freedom of religion, our freedom of speech, our freedom to vote and assemble and disagree with each other." Recognizing only American values as an explanation of terrorist action, the president relieved himself and his administration from any obligation to reassess the role of US power and behavior in Middle Eastern affairs.[3]

Following 9/11, Cheney and Rumsfeld proposed that the United States attack Iraq as well as al Qaeda in Afghanistan, but Powell opposed an immediate invasion of Iraq because it would inflame America's Middle Eastern Arab allies. The chairman of the Joint Chiefs of Staff General Henry B. Shelton agreed arguing that action against the Afghan terrorists be completed before launching other military strikes. Bush accepted their advice and delayed plans to attack Iraq. In

contemplating his opening move against terrorism, the president revealed that al Qaeda, a loosely affiliated terrorist organization, with its leader Osama bin Laden, had planned the attack. As bin Laden and his supporters resided in Afghanistan under the protection of that country's Taliban regime, Washington demanded that the Taliban government turn over al Qaeda leaders or face a US invasion.

With the Taliban's refusal, Washington, on October 7, launched its war against terrorism in Afghanistan. NATO had invoked Article 5 to provide military assistance, but the Pentagon preferred to act without major European support. It limited US forces to 60,000, with half retained in the Gulf Region, relying heavily on 15,000 Afghan Northern Alliance fighters and, after October, an equal number of Pashtuns in the south. Again, the American war centered heavily on precision bombing from aircraft, flying thousands of sorties, largely from carriers. The initial conflict was brief and US casualties few. The Taliban, along with al Qaeda leaders, retreated eastward to the cave complexes in the mountains bordering Pakistan. American-led forces seized control of Kabul by December 2001 and made Hamid Karzai head of Afghan's interim government. Bush's main problems were the failure to capture Osama bin Laden and to neutralize the Taliban – the latter would require nothing less than nation building. Unless reconstituted, the country would again become a haven for terrorists, but the fighting had rendered the entire region unstable. What the Afghan war achieved for America's war against terrorism remained tenuous.[4]

Its losses in Afghanistan deprived al Qaeda of its base, but it did not prevent the scattering of its leaders to Western Europe and throughout the Middle East, with less money and logistical support but still active. The thousands of men who had passed through the al Qaeda training camps in Afghanistan had returned to their homes around the world. After celebrating the Afghan victory in his State of the Union message on January 29, 2002, Bush said: "What we found in Afghanistan confirms that, far from ending there, our war against terror is only beginning." Americans must be patient in shutting down terrorist camps, disrupting their plans, and bringing them to justice. We must also prevent attacks by terrorist regimes "who seek chemical, biological or nuclear weapons" to threaten "the United States and the world." After citing North Korea, Iran, and Iraq as nations exporting terrorism and having weapons of mass destruction (WMD), Bush concluded: "States like these and their terrorist allies, constitute an axis of evil, arming to threaten the world." The United States "can't stop short—leaving terror camps intact and terror[ist] nations unchecked."[5] The administration's focus again was on Hussein.

G

## To the Bush Doctrine

Earlier, on November 21, President Bush had signed top-secret instructions to plan military options for an invasion of Iraq. At the same time, the president addressed Rumsfeld: "What kind of a war plan do you have for Iraq? How do you feel about the war plan for Iraq?"[6] With the overthrow of the Taliban, the Washington hawks demanded that the United States close in on Iraq. These demands prompted sharp differences over how to deal with Iraq, with Cheney and Rumsfeld claiming UN sanctions and weapons inspections had failed to remove or damage Saddam's regime for over 10 years, and diplomacy was a waste of time and money. In contrast, Powell said the Security Council's newly approved sanctions would weaken Saddam's control in Iraqi, because they would not only restrict Iraq's weapon's imports but also would help retain US alliances with Arab nations. He wanted to sponsor a Security Council resolution requiring Iraq to admit UNMOVIC inspectors, which Saddam had opposed since 1999. Meanwhile the Bush administration sought European support for a more aggressive policy toward Saddam. During a February 2002 NATO Conference on Security Policy at Munich, Republican Senator John McCain of Arizona declared: "The next front is apparent and we should not shrink from acknowledging it. A terrorist resides in Baghdad with the rich resources of the entire state" and is "proud of a decade-long record of

falsifying the international community's demands that he come clean on his programs to develop weapons of mass destruction." The American's hawkish position shocked European delegates. House of Commons member, Menzies Campbell, said Britain supported a stronger position against Iraq, but London "would require incontrovertible evidence in order to justify" a military operation. A member of the German Parliament (Reichstag), Gert Weisskirchen, wanted a "multilateral approach in US policy" toward Iraq, arguing America must involve its allies in planning and executing any battles ahead.[7]

Bush and British Prime Minister Blair met, in March 2002, where Bush insisted that Iraq must permit intrusive inspections of all its weaponry. A "Secret Downing Street Memo," dated July 23, 2002, made public in June 2005, summarized the status of Blair's partnership with Bush. It declared recent talks in Washington had concluded:

> Military action was now seen as inevitable. Bush wanted to remove Saddam through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy. The NSC had no patience with the UN route and no enthusiasm for publishing material on the Iraqi regime's record. There was little discussion of the aftermath of military action.

Since Britain's attorney general had indicated that the desire for regime change "was not a legal base for military action," the memo continued; there remained "three possible legal bases: self-defence, humanitarian intervention, or UNSC authorisation." The prime minister added that if Saddam Hussein refused to admit UN inspectors, this could provide legal grounds for action. During a July 23 session, British principals concluded they would assume the UK would take part in any military action once American planning was known. In addition, they would begin British military planning, check on the role of UN inspectors, seek out the positions of Turkey and EU members, and obtain a complete intelligence update on Iraq.[8]

Inasmuch as Saddam would never provide Washington with an overt excuse for intervention, an Iraqi war would be a matter of choice. The administration found the elusive legitimacy for a US invasion in the doctrine of preemption, granting the United States the right to defend itself from an impending attack. At West Point, on June 1, President Bush advanced the doctrine of preemption by declaring deterrence and containment obsolete. He argued that "new threats" required "new thinking. . .. We must take the battle to the enemy, disrupt his plans and confront the worst threats before they emerge. . .. Our security will require all Americans . . . to be ready for preemptive action when necessary to defend our liberty and to defend our lives." Finally he said: "We will not leave the safety of America at the mercy of a few mad terrorists and tyrants."[9] While he did not mention Iraq, most observers correctly concluded Bush was ready to attack Iraq – his preemptive war concepts became policy on September 20, 2002, as part of the US National Security Strategy. Here, Bush warned: "We will maintain the forces sufficient to support our obligations, and to defend freedom. Our forces will be strong enough to dissuade potential adversaries from pursuing a military build-up in hopes of surpassing, or equalling, the power of the United States." The country would seek international support, he acknowledged, but it would not "hesitate to act alone, if necessary, to exercise [its] right to self-defence by acting pre-emptively." The document was ultimately a defense of American unilateralism, based on the supposition that the United States was sufficiently powerful enough to eliminate, alone, anything unacceptable in world politics.[10]

The preemption option was not new. (Every president since Harry Truman understood that he possessed it, but they refrained from emphasizing or employing it.) The rules regarding preemptive war had long been embedded in international law and practice. What defined and justified its acceptable exercise was that the danger be clear and imminently threatening based on specific and incontrovertible evidence. The danger had to be critical and unacceptable. Finally, it had to exceed the possibility of control by peaceful means. Such rules could always be open to questioning, but they were sufficiently stringent and precise to rule out most claims for

the right of preemption. Henry Kissinger declared in an attack on preemption: "It cannot be in either the American national interest or the world's interest to develop principles that grant every nation an unfettered right of preemption against its own definition of threats to its security."[11] Preemptive war, launched in advance of any visible threat, simply had no standing in international law.

## The Administration Prevails

During the spring of 2002, the Bush administration confirmed its decision to convert the war against terrorism into a preemptive strike against Iraq. In March, Vice President Cheney observed that it was no longer a question of if, but of when, the United States would attack Iraq. British intelligence, like that of the United States, could find no evidence of Saddam's alleged weapons program or his connection with al Qaeda. On July 23, Sir Richard Dearlove, the head of British intelligence, reported to Prime Minister Tony Blair that the president had decided on war to remove Saddam Hussein: "Military action was now seen as inevitable. Bush wanted to remove Saddam through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around policy." Rice declared in a BBC interview of August 15 that the United States and other nations had no choice but to seek the removal of Saddam Hussein. Her arguments were moral as well as strategic. "This is an evil man," she averred, "who, left to his own devices, will wreak havoc again on his own population, his neighbours and, if he gets weapons of mass destruction and the means to deliver them, on all of us." She noted that Saddam was close to acquiring nuclear weapons, had used chemical weapons against his neighbors and his own people, and, after 1998, barred UN inspectors from his country – all enough to make Iraq a prime case for preemption. "History," she argued, "is littered with cases of inaction that led to very grave consequences for the world. [Past experience revealed] how many dictators who ended up being a tremendous global threat and killing thousands and, indeed, millions of people, we should have stopped in their tracks." How exactly Saddam presented such a danger she failed to explain.[12]

"There is no doubt," Cheney declared on August 26, "that Saddam Hussein now has weapons of mass destruction. There is no doubt he is amassing them to use against our friends, against our allies and against us." In the hands of a "murderous dictator," Cheney warned, weapons of mass destruction are "as grave a threat as can be imagined. The risks of inaction are far greater than the risk of action." This nation, he assured his listeners, "will not live at the mercy of terrorists or terror regimes." The vice president concluded that, in facing such a determined antagonist, weapons inspections were futile. "A return of inspectors," he said, "would provide no assurance whatsoever of his compliance with UN resolutions."[13] Cheney's speech was harsh and unilateralist. He found, however, during his visit to a dozen Middle Eastern countries little support for Washington's unilateralist approach. Beyond eliminating Iraq's weapons of mass destruction, the administration adopted, under the preachments of Cheney and others, the broader and more ambitious object of creating a thriving democracy in Iraq as a model for all Arab and Muslim nations.

Although Powell accepted the notion of preemptive war, he believed the president should seek international support available only through the United Nations. Cheney, Rumsfeld, and other hawks argued that the United Nations, not the United States, should be the issue, especially its failure to enforce its Iraqi resolutions. Cheney and Rice agreed that the United Nations was becoming irrelevant, reduced in large measure to a debating society. But at the August 16 meeting of the National Security Council, the members agreed unanimously to give the UN another chance to perform before Washington would advocate war. Former advisors to George H. W. Bush, Brent Scowcroft and James Baker opposed a new war with Iraqi. Former NSC advisor Scowcroft argued there was "scant evidence to tie Saddam to terrorist organizations" because Saddam has little in common with terrorists. He opposed an Iraqi war

that would divert American military activity "from our war on terrorism." About the same time, former Secretary of State James Baker conceded a military attack could force Saddam out of office but insisted "unless we do it the right way, there will be costs to other American foreign policy interests, including our relations with practically all Arab countries," as well as "our top foreign policy priority, the war on terrorism." Baker wanted "a simple and straightforward" Security Council resolution demanding intrusive inspections in Iraq with authorization to use "all necessary means to enforce it." Both Scowcroft and Baker opposed the use of military force unless the "Big Five" permanent Security Council members approved as in 1990.[14]

On September 7, at Camp David, Britain's Tony Blair announced that new evidence revealed activity at Iraq's nuclear sites. Bush confirmed Blair's revelation, "I don't know what more evidence we need." On September 8, Cheney claimed that: "We do know, with absolute certainty, that [Saddam] is using his procurement system to acquire the equipment he needs in order to enrich uranium to build a nuclear weapon." That same day Rice warned that Saddam was "actively pursuing a nuclear weapon" and that the tubes, described in US intelligence reports as dual-use items, were "only really suited for nuclear weapons programs." She acknowledged that there would always be some uncertainty about how quickly Iraq could acquire nuclear weapons but, she added, "We don't want the smoking gun to be a mushroom cloud." Others took up the theme of the mushroom cloud. On September 28, Bush told members of Congress: "The danger to our country is grave.... The Iraqi regime possesses biological and chemical weapons.... [It]'s seeking a nuclear bomb, and with fissile material, could build one within a year." At Cincinnati, on October 7, he averred that Saddam possessed a "stockpile of biological weapons, thousands of tons of chemical agents, [and was] reconstituting his nuclear weapons program.... Facing clear evidence of peril," he added, "we cannot wait for the final proof—the smoking gun—that could come in the form of a mushroom cloud."

On October 10–11, Congress authorized the president to order an invasion of Iraq whenever he might choose to do so. That crucial decision came without serious debate; the outcome was preordained. The administration had captured Congress and the public. (Without any evidence of links between Saddam and al Qaeda, a Pew Research poll of October found that 66 percent of Americans surveyed believed that Saddam helped the terrorists in the 9/11 attacks.) The vote in the House was 296 to 133, with 126 Democrats voting against it. The Senate vote was 77 to 23. Resolution 114 granted the president the power to "use the Armed Forces of the United States as he determines to be necessary and appropriate in order to defend the national security of the United States against the continuing threat posed by Iraq." The president need not consult Congress for a formal declaration of war. Critics deplored Congress's desertion of its constitutional role in governing such powers.[15]

## Bush Goes to War

After Security Council Resolution 1441 was approved on November 8, 2002, the UN Monitoring, Verification and Inspections Commission (UNMOVIC) headed by Hans Blix and International Atomic Energy Agency (IAEA) led by Mohamed ElBaradei resumed inspection of Iraq. During the first week, the UN Commission and IAEA made 20 inspections and failed to find any Iraqi biological or chemical weapons. CIA personnel monitored the inspectors' activity because their findings were vital to any decision on war. Moreover, Bush, Cheney, and Rice feared Blix was not aggressively pressing the search for weapons. On January 9, 2003, Blix reported that his inspectors had found no "smoking gun" to show Iraq had any proscribed weapons.[16]

Soon after, Defense Secretary Rumsfeld informed Bush that the essential US and UK troops were deployed in the Gulf Region and ready for war. Meanwhile, Bush met with Iraqi exiles on January 10 and told them if Saddam doesn't disarm, "we will remove him." One of the delighted exiles declared the "people will

greet troops with flowers and sweets." On January 11, Cheney, Rumsfeld, and chairman of the Joint Chiefs of Staff General Richard Meyers asked Saudi Arabia's Ambassador Prince Bandar bin Sultan to allow US soldiers and planes to move through Saudi territory on their way into Iraq as in 1991; this time they promised Saddam would be removed. Subsequently, Bander obtained approval for the United States to use Saudi Arabia's Prince Sultan Air Base to direct the coalition's air command and control facilities over Iraq, but the Saudis denied US and coalition forces the use of their seaports, territory, or air bases for combat operations. British Prime Minister Blair met with Bush on January 31, 2003. According to a memo by David Manning, Blair's foreign policy advisor, an attack on Iraq would begin on March 10 with the bombing of Iraqi targets. The two leaders believed there would be a quick victory and Bush thought "it was unlikely there would be internecine warfare between the different religious and ethnic groups."[17] This was a monumental miscalculation.

Meanwhile, the inspectors provided the Security Council with a second report on January 27, 2003, after IAEA teams had inspected 230 sites, and UNMOVIC teams had searched over 300 sites. Blix indicated inspectors did not know whether or not Iraq had biological, chemical, or nuclear weapons, but they lacked evidence that Iraq did. He thought there were "strong indications" Iraq produced more anthrax than declared, but there was no compelling evidence that Iraq desired to activate anthrax. Finally, he said Iraq had tested Samoud 2 missiles with a range of more than the permitted range of 90 miles (150 km) set by the 1991 UNSC resolution. IAEA teams found no evidence that Iraq had an active nuclear weapons program. Finally, Blix concluded, UNMOVIC and IAEA investigators would continue their search with approval from the Security Council, a view both chief inspectors shared as "a valuable investment in peace."[18]

What quickly undermined any hope for avoiding war through inspections was the escalation of US threats against Iraq during January and February. The administration's move toward war was increasingly apparent, rendering inspections irrelevant. Washington's continuing effort to produce the intelligence needed to underwrite its rationale for war culminated in Colin Powell's television address, of February 5, before the UN Security Council and the world. Powell began with the assurance: "What we are giving you are facts and conclusions based on solid intelligence" and then followed a multimedia slide show, with photographs of secret Iraqi weapons factories, tapes of intercepted telephone conversations among Iraqi officials, and charts revealing clandestine links between Baghdad and al Qaeda operatives. The message was clear and graphic: Iraq was guilty of denial, deception, and failure to disarm. World leaders found the speech unconvincing. Powell's portrayal of the Iraqi danger came under immediate examination that revealed only fragments to be accurate.[19] Yet for the administration, Powell's speech achieved its purpose – public opposition to an Iraqi war began to melt.

Members of the administration became increasingly contemptuous of opinions not their own. The president declared that he owed no one an explanation of his policy preferences. Rice declared that the failure of the UN to support the United States in Iraq mattered little; the United States alone would "act to defend . . . the world and the United States." Such bellicose rhetoric emanating from Washington placed the Bush administration totally at odds with many of its historic European allies. France and Germany, joined by Russia, had long established themselves as Washington's primary opponents in its effort to obtain European support for an Iraqi war. Polls revealed that eight out of ten Europeans agreed with the Franco-German opposition. Joseph Joffe, editor of the German political weekly *Die Zeit*, observed that America's opposition was less concerned with Saddam than with the need to inhibit the United States. "This," he concluded, "is about controlling American power." What underwrote much of Europe's fear of the United States was Washington's assertion that no nation be allowed to challenge America's global power and primacy. Secretary Rumsfeld warned France and Germany that they were facing diplomatic isolation in their opposition to war. The secretary

faced biting rebuttals from French, German, and Russian officials, with warnings that the United States was in danger of overreaching badly. Rumsfeld noted that Poland, the Czech Republic, and Hungary supported President Bush. He termed the supportive states of Eastern Europe the "New" Europe, in contrast to the "Old" Europe of Germany and France, long reduced, he said, to a harmless tourist attraction – France with its vanity and pride, Germany stubborn and wrongheaded.[20]

The United States, Britain, and Spain, on February 24, 2003, submitted a resolution to the Security Council declaring that Iraq had missed its final opportunity to disarm peacefully and now faced the consequences. Immediately, Germany, France, and Russia circulated an alternative plan to pursue the peaceful disarmament of Iraq through strengthened inspections extended over another 5 months. French President Jacques Chirac warned that France would veto any resolution that opened the way for war. No UN resolution emerged. As the administration moved toward war, it repeatedly warned of Saddam's weapons of mass destruction and their intended use. As Secretary Rumsfeld expressed: "Any country on the face of the Earth, with an active intelligence program, knows that Iraq has weapons of mass destruction." Speaking on March 17, the president again warned: "Intelligence gathered by this and other governments leaves no doubt that the Iraq regime continues to possess and conceal some of the most lethal weapons ever devised." Vice President Cheney offered even more frightening news: "We believe [Hussein] has, in fact, reconstituted nuclear weapons." To the end, Saddam's alleged weapons comprised the sole and most terrifying rationale for war. Yet Hans Blix observed that those who purported to know with certainty that Iraq had weapons could never identify their locations. The inspectors, he declared, had found no prohibited weapons at any site suggested by intelligence agencies.[21]

What enhanced the appeal of an Iraqi war was the conviction that a regime change in Baghdad would transform the entire Arab world. The president, in late February, declared that the liberation of Iraq would not only lead to a new regime for all Iraqis but also unleash the spread of democratic values throughout the Arab world. When questioned by members of Congress, secretaries Powell and Rumsfeld offered sweeping assurances that postwar Iraq would have a representative government "that would help transform the region around it." For the administration, the creation of a thriving Iraqi democracy would become a model for all Arab and Muslim nations; the new moderation would become contagious and assure a peaceful settlement of the Palestinian question. On March 16, Cheney declared that the Iraqis want "to get rid of Saddam Hussein and they will welcome as liberators the United States when we come to do that." Washington apparently hoped to imitate in Iraq the successes of the US occupations in post-1945 Germany, Italy, and Japan, in establishing an exemplary democratic regime. Unfortunately, these three countries scarcely served as a model for Iraq since they possessed all the essential materials for democratic reconstruction: educated and industrious populations, surviving infrastructures, modern industrial experience, and no large, restive minorities. Iraq was an artificial country of many faiths, tribes, and ethnic groups, including Sunnis, Shiites, and Kurds. Nowhere was it apparent how the United States could transform the country, divided essentially by its historic rivalries, into a united liberal-democratic state.[22]

## Bush Goes to War

On March 17, 2003, the president gave Saddam 48 h to quit Iraq. American security, he said, demanded no less. Two days later, from the Oval Office, he announced his decision for war, declaring again that Saddam constituted a grave danger. "We will meet that threat now," he said, "so we do not have to meet it later . . . on the streets of our cities." An ABC News-*Washington Post* poll found American overwhelmingly in agreement with the decision. The subsequent invasion of Iraq predictably encountered no weapons of mass destruction nor were they expected. Those weapons, always elusive, were the rationale for the war, not the reason.[23]

Perhaps the Iraqi war produced the easiest victory in US history. Precision bombing eliminated the anticipated, potentially costly but limited struggle for Baghdad. So unequal was the contest that some US soldiers wondered why the Iraqis would throw themselves away against such impossible odds. American pilots were equally dismayed by the total lack of sophistication in the Iraqi air defenses. No one had predicted that the initial defeat of the Iraqi forces would be difficult. Aboard the USS *Abraham Lincoln*, on May 1, President Bush declared victory with the assurance that "major combat operations in Iraq have ended." Behind him a banner declared MISSION ACCOMPLISHED. The United States, he declared, had eliminated its Iraqi enemies, disposed of an ally of the al Qaeda, and liberated the Iraqi people. It was in control of events in Iraq and set to rebuild Iraqi society, with Iraqis celebrating the US presence. Rice added that the United States had achieved a "special opportunity to advance a positive agenda for the Middle East that will strengthen security in the region and throughout the world."[24] Winning the war against terrorism demanded no less.

The official anticipation was that the easy military victory in Iraq would leave no problems in its trail. Rumsfeld believed that the mere presence of a small occupying force would be adequate to establish order. "We continue to feel," he declared in mid-April, "that there's no need for a broader conflict if the Iraq leaders act to save themselves." Consequently, he rejected consideration of the State Department's postwar plan convinced that American forces would turn over control to new Iraq authorities and leave. Consequently, when the fighting ended in April, the Pentagon was not prepared for the collapse of Iraqi society or the destruction of the country's infrastructures through looting and sabotage. Washington had received repeated warnings that the elimination of the Iraqi military could unleash massive looting of Baghdad's famed National Museum, the National Library, the Religious Endowment Library, and other such institutions with their priceless antiquities. The administration did nothing to protect them. The cultural losses were staggering. By May the looting had run its course, with military buildings, palaces, and many factories and stores stripped bare. The looting then shifted to robbing, abducting, and harassing. This was merely a dramatic portend of what was to come. Pentagon planners believed their forecasts so completely that they failed to prepare for the collapse of Iraq's social, economic, and political infrastructure. This left a security and administrative vacuum that the US military was totally unprepared to fill. American forces lacked the personnel to secure the streets, tackle the crime, restore a sense of public order, or recreate the necessary governing apparatus. Basic necessities, especially electricity, water, and gasoline, were almost nonexistent. An American official lamented, "The planning was ragged and the execution was worse."[25]

## The Protracted Occupation

By July 2003, US forces were facing dozens of assaults daily. The postwar deaths began to exceed the number killed in the war itself, with far greater numbers wounded, many seriously. Almost every night C-17 transport jets arrived at Andrews Air Force Base outside Washington on medical evacuation missions. That month General Tommy Franks, commander of US forces in Iraq, acknowledged that the dangers facing American security forces in Iraq were likely to persist. By the late months of 2003, almost every day bought reports of deadly roadside bombs directed against US combat patrols and supply convoys. The US military played down the attacks as insignificant and as having no effect on day-to-day operations. As late as November, the president proclaimed: "We are not only containing the terrorist threat, we are turning it back." President Bush and his advisers continued to link the war in Iraq with the war on terror, and thus any US retreat from Iraq would seriously threaten the nation's security. He defined the danger on August 26, 2003: "Our military is confronting terrorists in Iraq and Afghanistan and other places so our people will not have to confront terrorist violence in New York and St. Louis or Los Angeles." Henry Kissinger, who often conferred with the president,

warned in *The Washington Post* of August 12, 2005: "Victory over the insurgency is the only meaningful exit strategy." There must be no withdrawal of US forces. Vice President Cheney warned that any retreat from Iraq would expose the country to increased terrorist attacks.[26] The administration remained in a state of denial – there would be no "victory," only exit.

## Obama and Nuclear Weapons

In addition to Middle East issues, especially Iraq and Afghanistan, President Barack Obama inherited a need to negotiate a new treaty with Moscow reducing nuclear weaponry, contend with nuclear proliferation (especially in Iran and South Asia), and review Bush's antimissile system. Even after the collapse of the Soviet Union, in 1991, one prolonged episode after another arose involving critical events. Senior civilian and military leaders in Washington and Moscow – as well as in Washington and Beijing – never quite seemed to shed the trappings of the Cold War's environment despite moments of good feelings. In otherwise polite speeches, these unreconciled attitudes frequently arose during the dealing with post-Cold War strategic nuclear weaponry. These symptoms could be found in Washington's continuing insistence on deploying missile defenses systems that Moscow, and to some extent Beijing, questioned as threatening their deterrent forces. Yet, there was recognition of certain mutual interests as found in the Cooperative Threat Reduction program and Global Threat Reduction Initiative aimed at securing stocks of dangerous nuclear material scattered around the former Soviet Union and elsewhere in the world. Then, too, former adversaries cooperated in the functioning of such unofficial international agencies as the Nuclear Suppliers Group that sought to control the export of material, equipment, and facilities that if diverted from peaceful uses could contribute to nuclear weapons or creating other weapons of mass destruction.

The Obama administration needed to act promptly to replace the expiring 1991 bilateral Strategic Arms Reduction Treaty (START I) since both the United States and Russia used its verification system to monitor each other's strategic nuclear weaponry. The Russians objected to George W. Bush's proposed expansion of US missile defenses – a program of dubious value – to Europe, which were needed, according to the administration, to counter a possible missile threat from Iran. But, Russian officials protested, this system could be used to counter their missile force as well. Bush's other missile defense system was located primarily in Alaska to intercept any missiles for North Korea, but Beijing viewed it was developed to counter their missiles. Both Moscow and Beijing were convinced the United States was attempting to negate their missile forces designed to deter a US nuclear strike. Although neither opponent was placated by American denials, the Russians did agree in 2010 to a New START Treaty that replaced START I and led to a significant reduction in nuclear warheads.[27]

At Prague, on April 5, 2009, President Obama outlined a path toward "a world without nuclear weapons." He directed attention to elements of the nonproliferation regime "to cut off the building blocks needed for a bomb." Working together, he said, "we will strengthen the nuclear Non-Proliferation Treaty as a basis for cooperation." Various nations had been persuaded to give up their nuclear weapons programs – South Korea, Taiwan, Brazil, Argentina, South Africa, Libya, and the former Soviet republics – the question was could the programs of North Korea, Iran, India, Pakistan, and Israel be restrained? The hope of abolishing nuclear weapons was raised much earlier at the UN, in June 1988, by India's prime minister, Rajiv Gandhi, who warned that nuclear war "will mean the extinction of 4000 million: the end of life as we know it on our planet earth." Yet, Indian officials viewing China's nuclear program as threatening ultimately developed their own nuclear weapons and missiles. New Delhi's program, while providing a deterrence strategy vis-à-vis China, aroused fears in Pakistan sufficient for its officials to develop nuclear and missile programs. With few means to influence events, Americans must watch the competition between India and Pakistan and worry it could

erupt in hostilities with potentially disastrous results that would reach far beyond their borders.[28]

North Korea's nuclear ambitions presented a more complex set of circumstances: the desire for additional security vis-à-vis the United States and greater international recognition of their status. Perceived American nuclear threats, according to Michael Mazarr in *North Korea and the Bomb*, "have pervaded North Korean strategic thoughts and actions since the Korean War, and may have played a decisive role in stimulating North Korean leaders to embark upon their own nuclear weapons program." Responding to numerous North Korean violations of the armistice, the United States sent nuclear-capable artillery shells, rockets, cruise missiles, and land mines to bolster the defense of South Korea. During the Clinton administration, the United States and South Korea sought to entice the North Koreans to cooperate with IAEA inspections at suspected nuclear weapons facilities. Washington worked out a pact with North Korea on October 16, 1994 known as the Agreed Framework; it subsequently floundered because of a continuing aura of mistrust. George W. Bush's labeling North Korea as one of the "axis of evil" and, in 2002, Secretary of State Colin Powell's demand for controls on North Korea's missile program essentially terminated meaningful negotiations. Pyongyang tested two nuclear devices, in 2006 and 2009, with varying degrees of success and began developing and testing missiles as possible delivery vehicles. Many foreign observers believed the otherwise desperate, hungry population (and failing regime?) that make up North Korea was best symbolized by its nuclear and missile programs, which gave rise to the basic question, what are the programs intended to provide offensive weapons: defensive ones or symbols of status? In spite of the prolonged diplomatic negotiations with Pyongyang officials over the past two decades, the question of motivation still remains elusive.[29]

For several years, Western nations and, of course, Israel have viewed Iran as posing twin threats: the construction of enhanced nuclear enrichment facilities as a first step in obtaining nuclear warheads and an ambitious missile program. In Washington, officials first began worrying about Iran's interest in nuclear weaponry during the 1970s. A 1975 State Department memorandum suggested "uncertainty over" Iran's "long-term objectives despite its NPT status." Indeed, a Central Intelligence Agency's 1988 report asserted that Tehran had undertaken nuclear weapons "design work" prior to the 1979 Islamic Revolution and that the revolutionary government had initially halted the program only to reinstitute 3 years later. By 1985, a National Intelligence Council report identified Iran as a potential "proliferation threat" and declared that the new regime was "interested in developing facilities that . . . could eventually produce fissile material that could be used in a [nuclear] weapon." It was estimated that it would take at least a decade for Tehran to produce a weapon. An International Atomic Energy Agency investigation, together with information supplied by Tehran after an October 2003 agreement, suggested "Iran had engaged in a variety of clandestine nuclear-related activities." The election of President Mahmoud Ahmadinejad, in 2005, resulted in Iranian intransigence regarding restrictions on their nuclear activities. Yet, the Supreme Leader Ayatollah Ali Khamenei declared on June 3, 2008, that Iran was opposed to nuclear weapons "based on religious and Islamic beliefs as well as based on logic and wisdom." Even President Ahmadinejad asserted on April 9, 2009, "those who accumulate nuclear weapons are backwards in political terms." Unconvinced Western leaders turned to the UN Security Council for economic sanctions, found in Resolutions 1803 (2006), 1747 (2007), and 1696 (2006) and Resolution 1929 (2010), intended to halt or regulate Iran's nuclear enrichment programs and allow its facilities to be inspected by the International Atomic Energy Agency.

With diplomacy and sanctions, the West and the United States, particularly, continued seeking to persuade or coerce Iran not to join the nuclear weapons club. For example, the US Nuclear Posture Review Report in April 2010 stated: "we seek to bolster the nuclear non-proliferation regime and its centerpiece, the NPT, by reversing the nuclear ambitions of North Korea and Iran, strengthening

International Atomic Energy Agency safeguards and enforcing compliance with them." By late 2011, diplomatic activity and sanctions appeared unable to achieve the UN and IAEA's desired goals. Additionally, intermittent diplomatic activities were caught up in a basic contradiction: how to acknowledge Iran's sovereign rights and, yet, deny it the right to nuclear weaponry. No previous attempt was ever made to apply this contradictory policy – not to the acknowledged nuclear weapons states, including Israel, Pakistan, and India.[30]

## Back to the Middle East

President Barack Obama presided over the withdrawal of US forces from Iraq, confronted new tensions in the Middle East with the arise of "Arab Spring, and bolstered Afghanistan's inept government. The United States left Iraq not certain of the legacy left behind." In late December 2011, the United States lowered its flag in Baghdad as the US military mission in Iraq came officially to an end. The low-key ceremony stood in sharp contrast to America's 2003 invasion. Americans at first had no clear idea as to whether they were to be liberators or occupiers. Consequently, the resilience and effectiveness of the insurgents caught civilian and military officials in Baghdad and Washington unprepared for the bloody years that followed.

Contributing to the insurgency was General Franks and Rumsfeld's failure to grasp the force requirements for internal security, the resources needed for reconstruction, or a plan for establishing a new governing structure for Iraq. Not until August 5, 2004 was a plan for Iraq finally issued calling for controlling insurgent attacks, training Iraqi security forces, rehabilitating the economy, persuading the Sunnis by coercion and cooperation to stop supporting the violence, and developing a counterinsurgency program. These actions only gradually disarmed local militias and slowed insurgent attacks on civilians and coalition forces – between 2003 and 2010, there were over 1000 suicide bombings with, Iraqi civilians suffering heavy losses. On September 7, 2006, the United States "formally" turned over control of Iraq's armed forces to Prime Minister Nouri al-Maliki's government, and the next year, Iraqi officials began demanding Washington to set a date for withdrawal of American forces. In November 2008, a Status of Forces Agreement was signed stipulating that all US forces would be completely out of Iraq by December 31, 2011. Almost 9 years after the US invasion of Iraq, the withdrawal was completed on December 16.

The costs of the Iraqi misadventure in blood and treasure were considerable. Coalition troops suffered a total of 4804 fatalities – 4486 US, 179 British, and 139 others – and some 32,000 US wounded. Estimates of Iraqi fatalities ranged from 100,000 to 600,000, while tens of thousands fled the country. Direct financial costs as of withdrawal reached more than $800 billion, but ongoing medical treatment, replacement of vehicles, etc. will push the cost to $4 trillion or more. (The national debt increased from $5.7 to $10.6 trillion during Bush's presidency.) It is most difficult to assess what was accomplished, other than the hanging of Saddam Hussein, as bombings attributed to the Sunnis have continued to kill and injure mostly Shiites.[31]

The popular protests and rebellions in various Moslem countries – beginning in Egypt, spreading to Libya, Syria, and the Gulf Emirates – also took American policy-makers by surprise, causing some to applaud what was seen as a move toward democracy. In May 2011, Obama stated that America had four essential interests at stake in the Middle East: the security of Israel, ensuring the flow of the Persian Gulf's oil and gas, combating terrorism, and halting the proliferation of weapons of mass destruction. Iran, clearly, threatened each of these vital interests but was deterred by the US Fifth Fleet, based in the Gulf. If the pre-Arab Spring policies, based on a partnership with stable autocracies in the region, were adequate, by 2011 the United States found itself connected to the least democratic regimes. Attempting to assess these uprisings prompted some to view them as a "cold war" between Saudi Arabia and Iran, others

as a struggle between revolutionary and traditionalist regimes. In either case, it has been difficult for the United States to choose sides, especially based on earlier assumptions. Infrequently now, according to Columbia University's Andrew Exum, "do U.S. interests in the region lead to clear policy preferences. Often, in fact, it is unclear how U.S. interests are best served in the long run. And more often than not, U.S. interests actually compete against one another, forcing policymakers to prioritize ruthlessly." The region is changing and US policy-makers will necessarily assume some risk, but what may well meet short-range objectives may carry long-term dangers.[32]

Meanwhile, the United States had been trying to deal with the resurgence of the Taliban in Afghanistan brought on by shifting Washington's attention to Iraq and starving operations aimed at creating a strong, stable Afghan government. Thus, as American forces were withdrawn from Iraq, Washington called upon its NATO partners and Pakistan to meet the mounting Taliban insurgency. Unfortunately, US military operations over the border impaired its relations with Pakistan and raised questions about that nation's ability to deal with terrorists and the security of its nuclear weapons. Since 2007 the Taliban and other insurgents have increasingly employed mines and improvised explosive devices as they expanded their operations. From 2001 to 2011, the United States spent more than $467 billion, and coalitions forces suffered 2847 military fatalities – the majority (1864) being American.

On May 2, 2012, the US-Afghan strategic partnership agreement, signed by President Obama and Afghan President Hamid Karzai, confirmed 2014 for the planned withdrawal of all US combat troops but pledged the United States would not abandon Afghanistan. The agreement, though not legally binding, demonstrated that by applying three key historic lessons, the Obama administration avoided the pitfalls that plagued Bush officials in Iraq. It recognized Afghan sovereignty, did not demand American military immunity, and, in separate understandings, defused such sensitive issues detention facilities and special operations.

## Rogue States and Stateless Rogues

American officials during the next decades, it seems evident, will find the nation's security challenged by rogue states arming themselves with weapons of mass destruction (WMD) and by stateless rogues inspired, individually or in groups, to commit terrorist acts. What policies will officials devise to meet these challenges? Will they understand that the US superior military capabilities cannot always dictate favorable outcomes? What past experiences will they draw upon? In dealing with complex, worldwide threats, should not Washington emphasize international cooperation in policy and practice to obtain mutual goals? "Disinclined to rely on multinational regimes and institutions that were seen as cumbersome and lacking decisiveness," as the distinguished academic commentator Lawrence Scheinman delicately phrased it, "the [George W.] Bush administration chose to counter" the perceived threats of rogue states and terrorists "by unilateral means or, where necessary or appropriate, non-institutionalized multilateral arrangements."[33] Buried in the history of American relations with foreign states, there has always lingered an urge for unilateral action when tangled affairs challenged domestic desires. The same may be said of Washington's enthusiasm for international law – it was often applied when politically useful, ignored when it was not.

Another serious observer reviewing past US policies urged Americans not to assume the superiority of their institutions and values. Reviewing Washington's policies in Iraq, correspondent Robert Kaiser, who had served in Vietnam, lamented that Americans had apparently learned little. "We twice took a huge risk in the hope that we could predict and dominate events in a nation whose history we did not know, whose language few of us spoke, whose rivalries we didn't understand, whose expectations for life, politics and economics were all foreign to Americans."[34] Few disagreed.

## Globalization and Subnational Governments

Robert Agranoff
Indiana University, Bloomington, IN, USA

Subnational governments – states, regions, counties, municipalities, and metropolitan – regions – are increasingly impacted by cross-border influences. Once thought of as being programmatically subordinate to higher-level (national, federal, state) governments, they also increasingly operate within the context of cross-national contacts and influences, including globalization, familiar as "the sum of informal and formal values, norms, procedures, and institutions that help all actors. . . to identify, understand and address transboundary problems" (Weiss 2013: 2).

Globalization is a result of several boundary penetrating forces:

1. The influence of cross-national organizations, such as those connecting local governments
2. Within country trends that originate externally, for example, the municipal home rule or local powers/devolution movement
3. Substantive cross-national influences, such as the International Convention on Disabled Persons

4. Changes from the inside by professionals who have been influenced by international trends and standards, for example, in environmental management
5. Governing influences that are raised by international trends but implemented within a subnational government, for example, horizontal networks that support the elderly in their home.

For subnational governments (SNG), it is a matter of using knowledge, experience, and action in finding some equilibrium between cross-national influences on central policy making and administration and devolved local delegation/co-administration, identified as meta-governance by B. Guy Peters (2015).

Global forces, like much else in the contemporary world, impact SNGs because we live in a world of networks and networking, both horizontal and vertical. It is a world where increasing connectedness is at the core. Such a networked world exists above the state, below the state, and through the state. Horizontal networks link counterpart officials across borders. Vertical networks are relationships between national officials and supranational officials to which authority has been delegated. "Hierarchy and control lose out to community, collaboration, and self-organization" (Slaughter 2009: 97). Networks are not directed and controlled as much as they are managed and orchestrated. Power in networks flows from the ability to make the maximum number of valuable connections, based on the knowledge and skills to harness that power to achieve common purpose (Ibid: 100).

Put another way, in transnational governance networks are characterized by more non-binding "soft" rules, such as standards and guidelines, benchmarking and monitoring in contrast to legally based rules more characteristic of Westphalian (tiered) government, and emphasizing socialization, acculturalization, and normative pressures, along with more open access to membership and resources. Transfer is not unilateral or hierarchical but is ongoing and multidirectional, involving overlapping forces of policy and practice, largely engendered by multi-spaced social action (Kennett 2010).

Such networks, according to Manuel Castells (2012: 221–228), represent common features that characterize global movements. First, they are multimodal and decentered, maximizing opportunities for participating. Second, whereas they may begin communications on Internet social movements, they tend to occupy defined spaces, for example, urban space, making the Internet their core vehicle. Third, they generate their own form of "timeless time," eschewing clock time in anticipation of constant change. Fourth, they are called to action from the space of flows that easily create community. Fifth, these networked movements are virtual, in as much as the demonstration effects of several movements spring up in many places. Sixth, the deliberations that occur, if any, occur in the "space of autonomy," particularly when dealing with leaderless movements. Seventh, such horizontal, multimodal networks create elements of togetherness as a source of empowerment. Eighth, they are self-reflective networks, not necessarily in "assemblies" but through multiple internet forms, in a myriad of blogs and interactive discussions. Ninth, and finally, their demands are normally citizen-based and oriented- to deliberation-based consensus. Whereas Castell's global criteria were first defined for social protest movements, they also appear to apply quite well to global impacts on SNGs. He concludes that "The digital social networks based on the internet and wireless platforms are decisive tools for organizing" (229) (see also Wells 2015).

Subnationalism, that is, the actions of regions/provinces and similar second-order governments and localities like cities, counties, and city regions, is today considered to be primarily "bottom-up" engendered activity that adds on to national-level efforts in legal and economic policy. As Allen Scott (2002: 6) observes:

> . . . the local *can* be an important arena of social reconstruction in its own right, as being a conduit through which diverse national policies are mediated. The *local* is all the more important given the psychic and political distance of the central state from many of the constituencies that make up modern global city regions, as compared with the immediacy and relevance of the local community.

In this regard Scott's observations regarding global-local impacts include not only economic interests, but the impact of social movements, civic organizations, and increased emphasis on democratic participation and representation. The future course of globalization's impacts remains open. As Scott concludes, it will also be the "political debates that will be waged in the coming decades over its principal direction of change . . ." (Ibid: 7).

However, these impacts might be economic or social in force, contextually they are in the final analysis subject to state or central government action influence. They can only happen, as Michael Keating (2002: 386) observes, when there are clearly identifiable common interests and that political leaders are supportive. For example, with regard to promoting global city regions, Keating concludes:

> New demands are being placed on the political agenda, from strategies of economic development, through environmental concerns, to issues of social justice and identity politics. Yet the policy options available to city-regions as political systems are constrained by the external competitive environment. Here lies the dilemma of contemporary urban and regional politics. It is through politics that these tensions and conflicts will be resolved but this must be a democratic and inclusive politics, not one subordinated to a narrow policy agenda of boosterism and growth. The principal mechanism is government. Markets alone cannot substitute for government. Nor can vague notions of self-regulation or "governance," however soothing, help us resolve the conflicts of interest and values present in the urban context. Instead, the interests of business and development become synonymous with the general interest of the region. It is not surprising, then, that the issue of government keeps on reappearing on the policy agenda.

In regard to subnational governments, the state framework is thus very important, as are its political and bureaucratic elites. They cannot be outsourced. Slaughter (2009: 112) concludes, "Government officials must instead learn to orchestrate networks of these actors and guide them toward collaborative solutions."

This entry will examine global impacts in greater scope than those related only to cross-boundary economic activity. It will include supranational local-regional governing forces, the role of international organizations and networks, the impact of cross-national assistance projects, cross-government networks, new intergovernmental processes, and SNG dealing with network-induced complexity.

## Subnational Governments as Influential Actors on the Global Stage

First and foremost, subnational actors are increasingly seen as prominent actors in their own right. The actors of SNGs have opened up their abilities to operate independent of their national systems. Global forces in the post-welfare state era have moved away from the earlier welfare state orientation of principal-agent where the central state was the principal and regional and local authorities were agents, largely open to delivering services. Since the 1980s there has been a shift to greater local autonomy, "decongesting top-heavy regulatory and political and administrative systems by delegating some functions to lower levels", giving local authorities greater freedom to develop their own policy approaches. As John Loughlin et al. (2011: 5) conclude, Along with [The] ". . . growing realization that political decentralization and local autonomy were important elements of democracy itself. This can be seen in the development of the idea by a number of international organizations such as the Council of Europe and the United Nations" (Ibid).

Several notable bodies on the European scene have promoted SNG roles. The European Union (EU) Committee of Regions, established in 1994, was set up under the Single European Act (SEA) to help disadvantaged regions with regard to operating in the single market, providing several funding sources for disadvantaged regions, e.g., in Spain, Ireland, Italy, and Portugal, while reinforcing the principles of subsidiarity and partnership, recognizing the key roles of SNGs in policy implementation. "In practice this meant that regions and local authorities across Europe could access EU funding which, although tiny in comparison with total funding, could be significant for the locality in question" (Ibid: 7). Although the Council of Europe has paid focused

attention to local level democracy since 1957, in one form or another, it has maintained more concentrated interest in SNGs, now known as The Standing Conference of Local and Regional Authorities of Europe (CLRAE), most known for its Charter of Local Self-Government, defining the conditions of local autonomy in relation to regional and central authorities.

The charter (www.coefeleng/legaltext/122e.htm) is an important recognition of local governments in both federal and unitary systems. As Loughlin et al. (2011: 9) observe:

> The promulgation of the Charter may be interpreted as local authorities seeking to free themselves from the excessive regulation by central (and/or regional) governments. It is essentially concerned with laying out the conditions necessary for the exercise of local autonomy and the rights of local authorities vis-à-vis their national (or regional) governments. These conditions cover issues such as local fiscal autonomy, the right to adequate funding to carry out tasks designated by superior levels of government, the right to self-organization, etc. The importance of the Charter lies in the fact that it is a treaty-like document which, once signed and ratified by a member state, may be used by the Council to hold that state to account with regard to the Charter's implementation. The CLRAE monitors this implementation through a committee of independent experts, one from each of the forty-seven states.

Additionally, the Council of Europe has played core roles in the transitioning East and Central European Governments toward democracy, pushing that "the principle that effective decentralization is an element of 'good governance'" (Ibid: 9).

SNGs power to act domestically in a policy capacity has often been overlooked as independent actors or actors on the policy stage within the contexts of national policy. Policy implementation studies offer three important perspectives on the capacity of SNGs or their operatives to act: operational localism, majoritarian cities, and street-level bureaucratic discretion. First is the idea that policy aims maybe set nationally, but in the final analysis, they are put into place more remotely, leading to the risk of inconsistent or different realization of central goals. In regard to US education policy, Douglas Reed's (2014: 5) research concludes, "That localist politics is tied in important ways to local power structures and a local regime that must balance educational needs with other municipal and regional demands, which, in turn vary according to the local constellations and political contexts. Second, and related, are the local forces of majoritarianism. In Neil Kraus' (2013: 5) field study of local program responses concluded that local responses often run contrary to national policies, that majority-driven local policy decisions run against broader policies. In the Kraus study it was enforcement of equality, particularly in schools, but he found that "policy outcomes supported by majorities both demonstrate and exacerbate existing racial and economic inequalities" (5). Third, there is what has come to be known as government official-client use of in the field discretion in carrying out policies at the local (bureaucrat-client) level, bringing on "policy change." Policy implementation studies have come a long way in separating out the realities of policy at the street level. Anat Gofen's (2014) careful study of this phenomenon in Israel indicates that "divergence" leads to differing outcomes from formal policy. His detailed analysis of nurses, teachers, and social workers shows that policy divergent actions may contribute to policy change or "be legitimized through unofficial policy change" particularly when the street-level bureaucrat sees it as "other serving" (17). These down-the-line forces drive home the importance of "bottom-up" as well as "top-down" actions. Hence, one should not discount the continuing influence of SNGs at the policy implementation level.

These forces do not fundamentally change the increasingly pervasive influences of globalization on SNGs. To Nicolas Berggruen and Nathan Gardels (2013: 12), the complexity of global integration of trade, investment, production, and information flows requires greater political and technical capacity at local and other levels to manage the systemic links of interdependence. It means more power devolution where affected publics want a greater say in what is going on, balancing the SNG role with the central state as a primary actor, as the one ultimately responsible for guaranteeing social and economic rights (Felice 2010: 76). These guarantees must be balanced with devolutionary powers in a global era:

> That balance might be called "intelligent governance," which devolves power and meaningfully involves citizens in matters of their competence while fostering legitimacy and consent for delegated authority at higher levels of complexity. Devolving, involving, and decision-division are the key elements of intelligent governance that will reconcile knowledgeable democracy with accountable meritocracy. (Berggruen and Gardels 2013: 13)

It appears that to some degree most every governmental system needs to "reboot" their operating systems to meet such challenges.

## Beyond the Nation-State

In the past decades, particularly in Europe, SNG has become "internationalized" to a greater degree than ever before. Political scientists of earlier eras learned the concept of sovereignty in its more absolutist sense, based on the Hobbesian notion of a social contract between the people and the rulers in exchange of yielding some personal control for collective control, later understood to be limited by Lockean notions of limits based on public consent. Sovereignty today is bound up in the post-Westphalian notion of the nation-state as bounded externally within a territory, internally between structures of government and civil society and related interactions, and of course, by formal recognition on the part of other nations. Sovereignty in its traditional sense is now challenged by international activity that goes well beyond trade and diplomacy, includes actions of such international organizations as the United Nations and the European Union (EU) that are to take or set policies through which nation states surrender portions of their "sovereignty," in its earlier sense. For example, the EU is involved in considerably deeper political, economic, and social cooperation that reach well-beyond traditional notions of sovereignty. Most notable of these actions is the aforementioned activity with regard to local government. The European Charter of Local Self-government is a legal document. When signed by a country, the charter may be used to evaluate the health of local democracy in the state (Loughlin and Peters 1997).

Whereas the impact of trade and related economic activity is the most obvious force for internationalization, other cross-national issues also have increased global SNG involvement. Among others are concerns related to human rights, refugee resettlements, civic participation and representation at the subnational level, and governance of the Internet and Internet protocols.

Internet governance indeed highlights the emerging phenomena of global forces impacting SNG in bold relief (*Economist* 3/5/16, pp. 55–56). Crossing government and the private sector, the Internet Corporation for Assigned Names and Numbers (ICANN) is a new type of international organization that is a "global" attempt to standardize domain names and Internet protocol addresses. ICANN is operated by the 30-year-old Internet Engineering Task Force (IETF), which has been responsible for the Internet technical standards. Laura DeNardis's (2014: 69) research has captured the central global role of ITEF:

> The IETF's primary mission is the development of Internet protocol drafts. The organization has no formal membership. Participation is uncompensated activity and open to anyone. Agreement about standards does not involve formal voting but is based on what has long been termed in the IETF as "rough consensus and working code." Most work is accomplished in working groups organized around key problem areas via electronic mailing lists, although the IETF usually holds three plenary meetings annually. An area director (AD) leads each working group and these ADs, along with the chair of the IETF, comprise a governance body called the Internet Engineering Steering Group (IESG), which presents Internet draft standards to the Internet Architecture Board for consultation as formal Internet standards.

Perhaps foretelling future global organizations, ITEF's governance and procedures are an open organization "with processes that adhere to democratic principles of transparency and participation" (Ibid: 70). It represents a growing number of informal intergovernmental organizations characterized similarly by shared expectations, regular meetings but have no independent secretariat (Vabulas and Sindal 2013).

Internet global governance is revealing of how the traditional state is in transition. John Micklethwait and Adrian Woolridge (2014:

192–194) base global changes on overturning four misconceptions: all functions and services need to be conducted in house, decision-making should be centralized, public institutions like SNGs should be as uniform as possible, and that change in the public sector will not improve things. They suggest that global forces, like Internet governance, is about choice (210–220). Three trends are key. First, the "post bureaucratic state," with a small center and a multitude of public and private providers, will open state transparency, breaking the state to smaller and more innovative units. It means increasing purchaser-provided (or citizenship) distinction will continue to accelerate. Second, the state is becoming less uniform, teaching us that different sorts of organizations within the "public sector," organized by different principles. Third, the centralizing passion of the twentieth century is playing itself out as local governments are reasserting themselves, taking action(s) that control governments are normally unwilling or unable to face. In the emerging world, local reforms are laboratories for change, for example, in China and Southeast Asia cities are the focus of their knowledge economies and are forming relations with each other. "Ideas are also leaping from one local government to another. . . . over 300 cities have introduced bike sharing programs" (Ibid: 219). Fourth, albeit in some situations, "slowly bureaucrats and politicians are thinking differently, warding off their love of uniformity, as a new model emerges as the revolution is driven from below" (Ibid: 220).

## Organized Transnational SNG Networks

The Internet and email communication has given rise to a number of SNG organizations that are global, crossing traditional nation-state and regional lines. They are a product that in many ways supersede the border barriers of many NGOs, as they have come to the realization "that their efficiency requires international coordination" and hence networking with others sharing these beliefs; and new NGOs with a global focus have sprung up for similar reasons (Bhagwati 2004: 42).

Local governments have not only become closely embedded in their own country systems but are internationally becoming laboratories for broadening governance. Sue Goss (2001) once observed that isolated local governments were engaging in new sorts of interactions that involve "shared or negotiated processes," "changing the roles of managers," while "learning to accommodate mess" (pp. 3–4). "I suggest that what is emerging is a 'relationship organization' characterized by the capacity of all of its members to build and work within reciprocal relationships. A relationship organization is primarily connected outwards" (Goss 2001: 7). SNGs like local governments are no longer isolated from the broader trends of governing but extend up and down their system: cross-national, national, and intergovernmental. Regional and local governments are now enmeshed in a series of cross-national connections. For example, the European Union's Committee of Regions is comprised of nearly 350 regional and local governments, representing a shift in emphasis to recognize growth strategies of metropolitan zones and local growth strategies (Corijn 2009). To Benjamin Barber (2014: 113), cities worldwide are defined as "much by the networks they comprise as defining themselves through their bridging capital," outside of their jurisdictional domains, rather than that of their "bonding capital," unifying them internally. Networks of cities are prevalent engines of transnational cooperation, efforts that to Barber are easily overlooked because such efforts are voluntary and cooperative and often less formal (117).

Literally dozens of such SNG organizations are listed on the Internet. Those representing cities and city governments are most prevalent, ranging from the long-standing International City/County Management Association, founded in 1914, to C40 Cities, a climate change organization founded in 2005. A few of the more notable city-based transnational SNGs include:

1. ICLEI, Local Governments for Sustainability (www.iclei.org) involves over 1000 cities and metropolitan governments that connect leaders in strategic alliances promoting capacity for environmental sustainability.

2. Sister Cities International (www.sistercities.org) focuses on "citizen diplomacy in four main areas of exchange: arts and culture, youth and education, business and trade, and community development.
3. C40 Cities (www.c40.org) connects megacities, more than 75 of the world's largest cities, focusing on climate change and driving urban action that reduces greenhouse gas emissions and climate risks.
4. Organization of World Heritage Cities (www.ovpm.org) involving 250 cities listed on the UNESCO World Heritage list. Led by mayors, it encourages cooperation and the exchange of expertise on conservation management, particularly management and strategies of preservation and management of historic sites.
5. METROPOLIS (www.metropolis.org) with over 140 members provides an international forum for exploring issues and concerns of large cities, focusing on mutual learning and expertise building, promoting financial and technical assistance in developing countries, and promoting international political visibility to metropolitan interests.

Other SNG international organizations focus on international relations in Asia (www.clair.org.jp), world economic issues (www.weforum.org), local government in Southeast Asia (www.delgosea.ev/ems), urban development/redevelopment (www.inta-avin.org/en/), and public transport (www.vitp.org). Finally, ASEAN, the Association of Southeast Asian Nations (www.asean.org/asean), focuses on three areas: economic development, sociocultural exchange, and political security within democratic frameworks. Its charter includes ten member states and involves a legally binding agreement for community building.

What can these cross-national alliances bring to the SNG process? These organizations are regularly touted for their ability to expose actors to new skills and valuable forms of "policy learning," bringing together myriad of different skills and knowledge, creating unique learning opportunities (Inkpen 1998). However, the few studies that have been taken of such organizations show that their impact on policy change is less conclusive than often advanced. A study of Cities for Climate Protection concluded that "limited capacity to address climate protection locally is not primarily the result of an absence of information and knowledge, but rather stems from a lack of resources or powers to act, and tensions over how urban sustainability is to be interpreted." (Betsill and Bulkeley 2004: 489). The political must be factored into the technical. The study examines new policy discourses that were introduced but failed to permeate many aspects of the local authority. Moreover, they found that "the local politics of climate change involved multiple policy networks, many of which pre-date concerns for climate change specifically and which are entrenched around particular policy sectors" (Ibid). In a similar vein, a social network analysis study of C40 Cities (Lee and Van der Meene 2012: 215) work best when "learning ties are likely forums," "when cities create an internal committee of multiple stakeholders, have higher levels of experience and knowledge, and share a similar regional context and language". This study also concluded that learning ties in the C40 network are unevenly distributed making mutual learning problematic, particularly among nonstate decision-makers.

Needless to say globalization has its downsides and political limitations that impact governing. To begin, free trade may be hard to promote when its benefits and costs are balanced, the latter being the impetus for various types of protection seeking. Moreover, economic integration normally leads to harmonization of laws and regulations across countries, some of which lead to in-country resentment, particularly among those disadvantaged. In particular employment rules have had this effect, as has safety requirements. These integrative policies impact in-country democratic as SNG leaders, and processes are largely ignored raising conflicts between globally integrated regimes, sovereignty, and elected democratic bodies. These impacts are most applicable for SNGs. Moreover, large countries make it harder to satisfy voter preferences. Finally, rent-seeking businesses influence over trade regulations normally has harmful effects on workers and thwarts trade

liberalism. All of these forces normally lead to governments' increases in redistribution and investing in education, but the resultant inequality generally prevails. The risks of global impacts on those left behind are real (*Economist* 7/2/16, p. 67).

Despite any such limitations these transboundary organizations are here to stay, so to speak. As functions of what has been called polycentric governance, they are notably decentralized but not necessarily provided by a variety of organizations that expand the franchise to broaden the actors. "It is a new political game that is far more complicated and sophisticated, i.e., which no one player can dominate the field or determine the outcome, but where everyone has some power to affect the direction and flow of the process" (Rifkin 2005: 225). These organizations nevertheless raise the informational knowledge quotient needed for policentric governance working toward optimizing partnerships among global actors, taking into account the "array of actors at every level and the cumulative impact of networks of like-minded actors" (Weiss 2013: 36).

## Developmental Assistance

SNGs have been helped by NGOs that have expanded their traditional roles into non-humanitarian relief, to engaging in additional types of economic, and in technical and governmental aid. These developmental assistance programs involve longer-term commitments, in a sense redefining international affairs. Beginning with the UN Fund for Economic Development, it encouraged an institutional apparatus for studying developmental assistance, envisioning a network of countries and agencies around the world that would promote development. While initially aimed at economic development, working with central governments also meant close alignment with state policies, including the development of regional and local government capacities, ultimately integrating country units into the global economy. The programs were once known as involving "modernization" or social change that have occurred in developed societies that can be adapted in less-developed countries, particularly exchange programs that involved local officials and economic development specialists (Iriye 2002: 77–93).

Developmental assistance is also sponsored by a group originally founded by the Council of European Municipalities and Regions (CEMR). It was founded in Geneva in 1951 by a group of mayors. Later it opened its membership to regional governments. It is an umbrella organization of country associations of towns, municipalities, and regions from more than 30 countries, together representing some 100,000 SNG authorities. CEMR is primarily supported by national association fees, although the EU also supports the association through an annual grant. National associations that are not members of the Council of Europe or are from countries that do not hold free elections or subscribe to the European Charter provisions can only be associate members.

Basically CEMR promotes many of the same aims as that of the European Charter principles by trying to influence European law and policy, to exchange experiences with self-governance, and to engage in contacts with partners in other parts of the world. Its major working groups/policy areas include employment, energy, environment, equal opportunity, governance, the EU and the information society, local and regional democracy, north/south cooperation, employment in local government, procurement, regional policy, social affairs, transport, and urban and rural policies. It also promotes a very successful town-twinning network, involving over 26,000 European towns. In this activity, it works with the EU Director General of Education and Culture. It now forms the European section of a new multicontinental international organization, "United Cities and Local Governments." Finally, the association sponsors a wide range of seminars and issues a variety of reports. For example, it has conducted seminars on the impact of EU involvement on municipalities and towns for new members, along with promoting exchanges and best practices.

A prime example of subnational governance in this area was the work of many countries to reach across their borders to develop subnational

institutions in post-Soviet Ukraine through parliamentary development. A broad set of officials, university professors, and local government experts worked with the Ukrainian parliament to exchange ideas and strategies to develop subnational institutions and local governments. The focus was on issues of regionalism, given Ukraine's diversity and local government institutions, initially on constitution building but later on governing networks (Kolpakov 2014). The project built in options for oblast (region) and municipal autonomy and intergovernmental relations.

Developmental assistance with respect to SNGs includes but involves much more than building in government roles in trade and commerce. It involves exposure to and assistance in regional governments. It also involves the emergent linking roles of local governments, subventions, and contracts for services. In each country, SNG roles and responsibilities are both political and legal, needless to say which are difficult arenas of programs and policy, made more challenging by the connectedness now expected with globalization.

In addition to government institutions, there is increased focus on greater understanding of how networked systems work. Most important, as Ali Farazmand (2009: 10–12) concludes, is the need for government strategic adaptiveness, improved performance in service delivery, and to adopt development and advancement strategies. Strategic adaptiveness means capability building and looking beyond the status quo. Service delivery entails smart decisions on in-house production provision or contracting out. A development advancement strategy entails, as advanced countries do, "managing" their governance and administrative systems. This capacity entails forms of social learning with institutions, processes, and values that attract the most competent technical and process in-house operating capitol. It means, as Nicholas Berggruen and Nathan Gardels (2013: 157) conclude, to insert an international dimension into each country's domestic policy debate, in as much as "building a new order today is a matter not only for nation-states, but also for subnational entities. . ."

## Network Challenges

One overreaching force of impact is that in the network era that cross traditional Westphalian lines, the management of production, service, and regulatory networks "requires significant sophistocatory coordination and cooperation" that go "well beyond traditional concepts of outsourcing" (Abonyi and Van Slyke 2010: S36). As government enters new policy areas, a premium of emerging roles is placed on traditional government functions: learning and capacity building and understanding and mapping global value chains, such key devices of change as policy/regulatory prioritization, accelerating technological change, increasing capital (and knowledge) mobility, and increasing competition. As a result, global value chains and networks expand exponentially (Ibid: S35).

A first principle of involving government/non-government networks is that whereas the roles of governments are shifting with globalization, government cannot be dismissed as mostly absent or in some way hollowed out. The core importance of also keeping governmental bodies in the analytical mix in networked global impacts is continually relevant. The paradox of civil society, warns Michael Walzer (1998: 138), is to avoid the "anti-political tendencies that commonly accompany the celebration of civil society which are overstated; the network of associations incorporates, but it cannot dispense with the agencies of state power." The same would be true with regard to global networks. Walzer continues, "Citizenship is one of the many roles members play, but the state itself is unlike all other associations. It both frames civil society and occupies space within it, fixing boundary conditions and the basic rules of associational activity, compelling association members to think about the common good (138)." In these overarching respects, SNG activists and networked activity have not displaced government power nor necessarily hollowed out government. The degree to which external influences governments' role remains an open question.

The role of networks and network behavior here affecting SNGs is nevertheless in no way to

be minimized, particularly at the local or operating level, as they are now called upon to take the "wicked" problems facing governments (Rittel and Webber 1973) that are nettlesome, cross-boundary and highly interdisciplinary. Networks play a central role on focusing on difficult problems, where people live means looking for adaptable technologies, developing and managing knowledge, engaging in interactive programming and strategies, looking for feasible solutions, and in many cases the need to bank on their forms of joint programming and policy making.

In the *Oxford Handbook of American Bureaucracy*, Michael McGuire and Robert Agranoff (2010: 390) attempted to put meaningful parameters around this type of governance:

> Networks, however, have to be evaluated in light of the realities with which they operate. They –and for the for-profit and nonprofit actors comprising them—are limited in role, capacity, and authority relative to their public agency partners. These typically include legal mandates to take action to address the problem(s) targeted by the network, agency organizational and staffing capacity, the financial resources government control, the legitimacy government participation brings to the network, and the managerial responsibilities that public agencies assume in running them.

Networks also normally rely on the operations of their partners to implement programs. In virtually no ways are networks replacing government administrative agencies despite nonlinear relationships. The potential for new tools, methods, and theories to be devised to accommodate this stochasticity is considerable (Koliba and Zia 2013). In this regard, Koliba (2014) calls for capturing network theory building with computer simulation modeling, employing such techniques as system dynamics, agent-based modeling, social network analysis, and qualitative comparative analysis, as new data-mining programs are allowing large volumes of verbal and numerical data to be analyzed for emergent and often hidden patterns. These approaches will enhance network performance and will also extend knowledge in several different arenas. Other emergent techniques, including augmented mapping applied alone or coupled with public participative or collaborative GIS programming (Dragicevic and Balram 2004). Also, new sets of insights into the ways in which network members cluster around spatially related problems as well as the cleavages between network members are being developed (Mahmood et al. 2012).

Even more may be possible in solving some globalization impact riddles. In an interesting new volume on networked science, that is online interaction, Michael Nielson (2012) suggests that continued interactions can expand collaborative volume in some areas of inquiry, achieving what he calls conversational critical mass. This can be accomplished by modularizing collaboration by splitting up tasks into smaller subtasks that can be attacked independently. It will also encourage small contributions, reduce barriers to entry, and broaden the range of expertise. Thereby a rich and well-structured global SNG-related information commons may emerge, building on several persons' work incrementally as well as by collaborative means.

Open-source information has the potential to add to the deliberative power of interacting parties in networks, directing attention from information that participants already know to which they need to approach problems, serving the important function of "collective insight" (Nielson 2012: 66). To the extent that global networks operate in open cultures of sharing "where as much information is moved out of people's heads . . . and onto the network" (Nielson 2012: 183), the search for meaning may well undergird network processes.

In many ways the SNG research frontier appears to be most fruitful on the changing boundaries of the state in governing and how it works interactively with its partners. It is a matter of maintaining the changing perspectives on *government in governing*, since theories of the hollowed-out state and the end of bureaucracy appear to fall short of reality. Contracting and service delivery outside of government plus networks and other collaborative mechanisms are signature forms of the current age but continue to operate in the shadow of bureaucracy (McGuire and Agranoff 2010). As this entry has made clear, government has taken on new roles but it has not disappeared at any level.

Research makes clear that government agencies remain as central and authoritative partners in networked arrangements, guiding interacting partners toward decisions that respect law and political considerations and regulatory and fiscal concerns and promoting a fair-playing field among participants (McGuire and Agranoff 2011; Olsen 2006; Wondolleck and Jaffee 2000). Indeed, as Paul Hirst (2000) concludes, government remains the agent that pulls the various forces together, distributes power and responsibilities, is the focus of political identity, and is the main instrument of political legitimacy. It is within this context of the bounded state that contemporary SNGs can be understood. Although often thought of as at the bottom of SNG chains, at the core is the role of local governments operating within larger systems. Their roles in governing are indeed varied, ranging in some countries with considerable degrees self-rule whereas others are considered to be little more than delivery systems or agents of their central governments.

It is also important to maintain the idea that whereas networks not only perform different functions that many of them are limited in scope and powers. In the author's multiple site network study (Agranoff 2007: 10), a grounded theory research approach revealed at least four types of networks that varied considerably in their ability to meet interagency and interprogram expectations. They are identified here with a link to each by global-serving networks mentioned in this entry:

1. *Informational*, nonbinding exchange of programs and knowledge-related technologies, where any action is to be taken by participating agencies on a voluntary basis. An example is ILCEI, local governments for sustainability that connects leaders in cities and metropolitan areas for promoting independent capacity.
2. *Developmental*, where partner information and technical exchange are combined with member services that increase participant capability to operationally implement their own activities. METROPOLIS provides a cross-national forum for big cities focusing on mutual learning and capacity building.
3. *Outreach*, where partners not only exchange program knowledge and techniques but also design actual programs that are subsequently implemented by the varied government agencies and NGO implementers. The Council of European Municipalities and Regions (CEMR) develops strategic positions implemented by mayors and councils in employment, energy, social affairs, and transport, among others.
4. *Action*, where partners reach agreements relating to interagency adjustments, formally adopt courses of action and or deliver integrated services. This type of networked action happens in most development assistance programs, as they do not bypass but deal directly with potential local political and legal barriers and facilitators, such as most programs of the United Nations Committee for Industrial Development and many similar programs, as well as the country-level environmental action plans through the European Council.

With the exception of the *action* category, many networks prove rather limited in scope and power over real decisions. In particular, informational and developmental network are perhaps the most prevalent, but their power is more informal, leaving ultimate decisions to participants, particularly partnering governments (McGuire and Agranoff 2014). Emergent studies of governance have pointed to more realistic power-sharing models of governance. The complexities of the policy/program chain from either international regime or central/general government reveal a complex mix of legal, program, and fiscal controls that are filtered down the line, by second-tier governments in federal systems and regional administrations in unitary systems, to the local level where program design and operations not only go through governments and NGOs. Operations or implementation then adds strong potential for operational localism and street-level divergence. Conceptually, such cognitive strategic and organizational complexity (Koppenjan and Klijn 2014: 157) have made "administration"

substantially different from that of hierarchical or conventional bureaucracy, not necessarily as a replacement, but with the added dimensions of governing challenges in many situations, also compounded due to the nested governing positions of regional and local governments (see also Koliba 2010).

## Conclusion

The key to sound governance involving SNGs, we have learned, is to go far beyond contracting or outsourcing, particularly in creating government partnerships based on transparency and shared responsibility and authority. It is, as suggested, related to capacity development for governments at all levels:

1. Institutional self-organizing entities that include but go beyond bureaucratic organization
2. Organizing activity that encompasses process and structure for collaborative action
3. Policy capacity, or directional, and program guidance to manage under conflicting and interactive conditions
4. Administrative capacities, to run the machinery of system, executing policy decisions and translating collective will into actions through implementation and management

It requires, concludes Ali Farazmand (2009: 1017), elevation of public administration to encompass a broader scope, focusing on government as leader and empowering a multitude of institutional forms and networks. Politicians come and go, and public sentiments change and swing by forces of power, money, and elite manipulation, but it is "age-old administrative capacity that must maintain order with a full anticipatory capacity and stand ready to meet the challenges of increasingly unknown tomorrow . . ." (Farazmand 2009: 1017).

An emergent concern that is at the core of global impacts on SNG also builds on complexity theory concepts. For example, Joop Koppenjan and Erik-Hans Klijn (2014) conclude that persistent focus on the identification of linear, deterministic relationships that drive much of network performance to date may be limited. However, if networks are viewed as dynamic and complex, the challenge can be seen as taking place where art, craft, and science meet. Art brings in integration, craft makes the connections, and science provides the latter systematic analysis of knowledge.

## Globalization and Terrorism

Robin Cameron
Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

*"All terrorism is international"*
*– Charles Kegley Jr. 1990*

Globalization and terrorism did not start at the end of the Cold War or after September 11 2001 attacks in New York. In fact, the account given here will entirely precede it, outlining the interaction between global processes and local resistances it generates. Globalization and terrorism have long been complex and intertwined. This chapter seeks to track the shift of terrorism from highly localized sites of anti-colonial and revolutionary struggle to globally mediated asymmetrical conflict. Underpinning this shift is a dialectic between the local and global whereby local resistance and nationalist movements seek to counter the asymmetry of systems of domination and control that existed previously under colonialism or in more recent years under other foreign interventions by utilizing emergent global media industries to deploy a political message. This is an important element not only of the effectiveness of terrorism as a tactic but also of the globalization of terrorism as a wider social phenomenon (Nacos 2002). Violent actions in distant localities have increasingly become sources of perceived solidarity or perceived danger for disparate audiences networked through digital communications technology (Lewis 2005). In this context, the contestation over the representation of violence to global audiences plays a major role in polarizing parties to the conflict.

The local and global dimensions of terrorism function as generative rather competing dynamics in this discussion. This chapter seeks to offer an interdisciplinary framework for understanding terrorism in an era where borders are often porous, information is increasingly unbounded, and strategic violence can be projected globally (Cronin 2003). While terrorism has increasingly come to operate in an era of highly diffuse communications systems, there is nonetheless a key role played by the state. State parties rely on sovereignty to make a claim to legitimacy when responding to terrorism, particularly when using force, whether it is in a domestic policing capacity or military intervention. States, however, can equally be supporters as well as counters to terrorism (Cohan 2002, pp. 85–88). Vital to understanding the globalization of terrorism that the measures required to create a monopoly over state violence and a demarcated space in which state violence occurs is not without consequences, one of which being terrorism as an asymmetrical strategy of resisting perceived illegitimate rule.

Defining terrorism has become a problem so entrenched that is unlikely to ever be resolved in a manner satisfactory to all (Hodgson and Tadros 2013). Nevertheless, I shall include one here, not to solve the puzzle and convince the diverse array of terrorism scholars and counter-terrorism policy-makers about the correctness of my definition, but rather to provide readers with a sense of how the term is being used in this chapter. Terrorism is a term in which the speaker is always taking a position in its rhetorical deployment; it can never be neutral or apolitical (Acharya 2009). Furthermore, the position that is being taken implicitly or explicitly in the definition and use of the term is subject to a divisive discursive structure in which there is very little middle ground and participants are perceived as taking a side (Cameron 2007; Schmid 2007). While it is highly contested, there is a broad set of tactics that can be articulated as a contemporary working definition for this chapter. Terrorism is a tactic of asymmetrical warfare employing strategic violence and communications campaigns to resist or attack a more powerful force that is perceived to be unjust or illegitimate. Violence functions as a tactic to enable the dispersal of the group's message rather than the end unto itself. A crucial element of the effectiveness of this tactic is to utilize available social and media networks to extend the impact of the message the group seeks to spread. With this in mind, the chapter

will suggest that as the scope of social and media networks has become increasingly global, so too has the scope of terrorism. This tactic, however, did not emerge in isolation but rather is an adaptation of tactics used historically by other actors.

## On Terror and Terrorism

The idea of terrorism can also be understood by examining the historical usage of the term "terror" by thinkers on the topic of political power. It is after all most often a contestation over political power by groups who engage this tactic (Pape 2005). A key thinker for whom the idea of terror played a significant role in his conception of power was Thomas Hobbes. Writing in response to the seventeenth-century English civil war, Hobbes contrasts what he refers to laws of nature, positive attributes of a society governed by a sovereign power, with natural passions, actions arising from a lack of restraint. Hobbes writes, "for the laws of nature, as justice, equity, modesty, mercy, and, in sum, doing to others as we would be done to, of themselves, without the terror of some power to cause them to be observed, are contrary to our natural passions, that carry us to partiality, pride, revenge, and the like" (Hobbes 1651 [1997], p. 129). Here, terror is the deterrent sense of awe experienced by citizens in the face of the Leviathan, the constituent agents of sovereign power. This terror functions as a rudimentary technique to control the movement, actions, and passions of the people, ultimately what was to emerge as an ordering principle of the modern state.

While terror can function as a means of maintaining order, it can also be used for the purposes of revolution and state formation. The key figure in this regard is Maximilien Robespierre and revolutionary reign of terror that was brought to eighteenth-century France. The use of fear was an explicit tactic of fear to enable change in the political order.

Robespierre declared, "it is time that equality bore its scythe above all heads. It is time to horrify all the conspirators. So legislators, place Terror on the order of the day! Let us be in revolution, because everywhere counter-revolution is being woven by our enemies. The blade of the law should hover over all the guilty" (quoted in Thorup 2010, p. 88). While in its initial iteration terror had a revolutionary function in order to found the first French Republic, it was equally seen as principle that could be brought to bear in order to maintain order and ensure justice. Robespierre again suggests, "terror is nothing other than justice, prompt, severe, inflexible; it is therefore an emanation of virtue; it is not so much a special principle as it is a consequence of the general principle of democracy applied to our country's most urgent needs"(quoted in Battersby 2003, p. 70). What at first glance seems to be a conception of terror opposed to that of Hobbes, insofar as it was deployed to overturn the rule of a king, it was subsequently redeployed in a more compatible fashion to maintain rule. The common thread through both modes of terror is that it represents the violence of the state both in its state formation mode and its state rule mode. While terror was a mode of state power advocated by Hobbes and Robespierre for the maintenance of order, it can equally be the power of the state brought to bear in its most destructive manner.

If one dimension of terror as a tactic of the state was social control, this mode of state violence was taken to its frightening apogee under twentieth-century totalitarianism. Responding to the rise of the German Third Reich in the 1930s and the atrocities committed against Jews and other minorities, Hannah Arendt undertook a study of the structures of control under totalitarian rule in Germany and the USSR. She suggested "if lawfulness is the essence of non-tyrannical government and lawlessness is the essence of tyranny, then terror is the essence of totalitarian domination" (Arendt 1951 [1996], p. 464). Law is positioned in this formulation as not only a means of ensuring the conduct of citizens but also a check on the exercise of power by the state. The absence of law is not in itself a cause of domination, but short of other restraints on the state or powerful citizens, they can act with impunity. The ability of powerful state or non-state actors to arbitrarily benefit themselves or harm others does not in itself entail totalitarian domination. Terror here is

the complete lack of control of one's fate in the face of immense and expansive state power. Total control was not just through the terror of physical violence by the totalitarian states of Nazi Germany and Stalin's USSR but also the erosion of the grounds for certainty to the point where people would "believe everything and nothing, think that everything was possible and nothing was true" (ibid., p. 382). This epistemological propaganda was so effective that it did not even have to be hidden from its citizens; indeed "they had known all along that the statement was a lie and would admire the leaders for their superior tactical cleverness" (ibid.). Terror under totalitarianism is complete physical and psychic domination.

Terror in this brief intellectual history is a function of state power. But how does this connect to the question of "terrorism" in a more contemporaneous sense? At first glance, this seems to run entirely counter to the understanding of contemporary "terrorism" received through counter-terrorism policy of most countries in the early decades of the twentieth century; the former is historically associated here with the exertion of various sorts of control by the state, whereas the latter connotes aberrant politics and ideology practiced by illegitimate non-state actors. Charles Tilly usefully warns against conflating the terms "terror," "terrorism," and "terrorists" (2004, p. 5). His corrective is that terror is a tactic of asymmetry adopted against enemies more powerful or populations larger than that of the actor. Terror can therefore be common to a Hobbesian Leviathan, a Robespierrean revolutionary, or a system of totalitarian domination or, as I will suggest momentarily, colonial violence. Equally, however, it may be adopted by resistance groups that seek to oppose it. In this latter respect, terror and terrorism begin to overlap. Terrorism is not a tactic but a strategy (ibid., p. 9). Tilly suggests this is a conceptually fluid category, as actors will always be participating in multiple fields of political fields of contestation and deploying a variety of tactics. So, not only are the terms terror, terrorist, and terrorism not synonymous, we should neither assume that all three apply in the same instance simultaneously or in exclusion of other tactics, actors, or strategies. While most states define terrorism in various ways as a crime against the state or its people, there is very rarely a pure ideological strand that unites all terror, terrorism, and terrorists while excluding other tactics or actors (Tilly 2005, p. 21). In this sense, the usage of the term "terrorism" reflects wider discursive formation and its consolidation into law rather than analytical utility.

Another way to understand the connection between terror and terrorism is through the contestation over state power especially in regard to the monopoly of violence. Terror can take the form of sovereignty, revolution, domination, or, as I will suggest in the following section, systemic violence. Each of the four observations of terror highlights a different emphasis within the repertoire of state power and its ability to exert control over a population. Across all four, however, the political tactic of terror has a fundamental relation to state power. This aligns with Weber's conception of violence as the foundational basis and ongoing constitutive necessity for the state. According to Weber:

> . . .a state is a human community that (successfully) claims the monopoly of the legitimate use of physical force within a given territory. Note that 'territory' is one of the characteristics of the state. Specifically, at the present time, the right to use physical force is ascribed to other institutions or to individuals only to the extent to which the state permits it. The state is considered the sole source of the 'right' to use violence. (Weber 1919 [1947], p.78)

Terror, in the historical senses discussed to this point, functions as an attempt to either establish or maintain the monopoly of violence and furthermore to elevate it to an organizing principle. Prior to the contemporary discursive construction of terrorism as a specific strategy of non-state actors, terror functioned as a tool of state formation or state governance. The evolution of this notion of terror to that of terrorism, which is more common today, emerges from the use asymmetrical tactics as a counterclaim on territory through the undermining of the monopoly on the use of the violence, as occurred in many colonial and nationalist movements against colonialism.

## Colonial Age of Terrorism

The use of terror for the purposes of political control also functioned under the global structures of colonial rule. While the conceptual relationship between terror and terrorism has been articulated in the preceding section, this section seeks to connect this historical usage and the contemporary understanding. Namely, that the use of terror to maintain a subject population in a state of fear became generative of violent resistance in the twilight of the colonial era. This cursory historical overview of terror as a technique of state control may not seem to be immediately connected to the concept of globalization; it does highlight the geographical spread and transmogrification of the use of state violence to maintain order. Under the global structures of colonial rule by European nation-states, we can begin to see the basis for a more global understanding of terrorism as emerging transnational communications enabled a wider awareness of independence struggles. This section will suggest that while highly localized in the specificity of colonial struggles, there are nonetheless distinct global dimensions to the colonial age of terrorism that foreshadow greater degrees of globalization.

If the terror of totalitarianism was an extreme yet arbitrary form of domination, then under colonialism terror was systemic. Frantz Fanon was one of the most penetrating observers of the cruelty of the late stages of colonial rule, drawing attention to its essential dehumanizing effects in an era where European nations proclaimed the high ideals of human rights and equality. Writing in the context of the Algerian National Liberation Front (FLN) fight for self-determination and independence from French colonial rule, Fanon observed that terror was not only deployed by the state but was generative of similar violence among those being dominated. "Terror, counter-terror, violence, counter-violence: that is what observers bitterly record when they describe the circle of hate, which is so tenacious and so evident in Algeria" (Fanon 1961 [2004], p. 47). Counterterror emerges as the internalization of the violence of colonialism, which ensures the violence is not momentary but cyclical. This violence was explicitly evident in the resistance movement against the French, but the internalization of the violence was more expansive and penetrating than the violence of the civil war. In effect the cycle of violence or perhaps more accurately the circulation of violence becomes the currency of social relations. Introducing Fanon's *Wretched of the Earth* and speaking to his own experience as a Frenchman of the civil war, Sartre suggested "colonial aggression is internalized by the colonized as a form of terror. By that I mean not only the fear they feel when faced with our limitless means of repression but also that their own fury inspires in them" (Sartre in Fanon 1961 [2004], p. lii). In this colonial moment, we witness the shift from the historical mode of state terror sketched out in the preceding paragraphs to the tactic widely described as terrorism as a form of asymmetrical resistance against a government of authority that is perceived to be unjust.

The FLN actions against the French colonial presence in the Algerian War of Independence not only demonstrate the breakdown of the brutal use of terror as a means of control but also the use of terrorism as strategy for seeking independence. The FLN was inspired by the Brazilian insurgent Carlos Marighella's guerrilla tactics (Horne 1977, p. 118) and Vietnamese nationalist Ho Chi Minh's willingness to take greater casualties (Evans and Philips 2007, p. 56). The FLN adopted terrorist tactics in order to militarize the conflict, drawing the French into a massive overreaction that shifted the conflict from the domination of colonial policing and control to total war. The asymmetry of the conflict was represented in the casualties. While the FLN employed tactics of ambush and bombing civilian targets, their losses were far greater, most likely by a factor of 10 (Horne 1977, p. 122). This combined with the establishment of camps, controls on movement, and shutting down of borders served to bolster an Algerian nationalism centered on anti-French sentiment and focused the conflict into the urban setting of Algiers (Derradji 2002, p. 118). The more military power the French threw at the city, the more support the resistance gained at the expense of the legitimacy of the ongoing colonial occupation domestically and abroad (Talbott 1980,

pp. 78–80). Through sheer force of numbers and hardware from a purely military perspective, France won the war in Algeria, routing the FLN as a fighting force. The French, however, were ultimately brought to a stalemate by the asymmetrical terrorism strategy as the continued occupation became untenable. On top of this, the political battle was lost due to waning domestic public opinion in France (Whitfield 2005) and a lack of support from the wider international community.

The strategy of the FLN was not limited to strategic violence and coercion; it also adopted a political and diplomatic strategy designed to gain international attention for their cause. Given the overwhelming power of the French Army, the FLN adopted not only the violent asymmetrical terrorism but also combined this with attempts to shift international opinion in its favor through diplomacy. This involved two main strategies. The first took advantage of Cold War geopolitics to gain material and diplomatic support from communist-aligned countries who were willing to back it against the west (Connolly 2001, p. 223). This strategy was also supplemented by support from other anti-colonial states who had either recently achieved independence or were seeking it. The second involved participating in international negotiations and meetings, particularly the United Nations (Connolly 2002). This strategy was made explicit by a FLN representative who, in a speech at the UN, suggested "every time a bomb explodes in Algiers we are taken more seriously here" (Hutchison 1978, p. 91). FLN violence was not used abroad; it was only used against French forces in Algeria and, in this sense, was highly localized. But insofar as France was a late-colonial power, embedded in the wider international community, FLN terrorism had a wider intended global audience. This wider global strategy is one that would become central to modern terrorism strategies.

The shift from local to global concerns changes how terrorism ought to be conceptualized. As described earlier, Tilly suggests that there are a large number of actors willing to use terror as a tactic, far greater than those that would be described as terrorists in the contemporary era. Even of those that adopt the more recognizably strategy of terrorism, most also deploy a wide range of other strategies and there is no pure "terrorist." This means that over time or in different contexts, whether a group can be regarded as terrorists or not is likely to vary. Because a "remarkable array of actors sometimes adopt terror as a strategy, no coherent set of cause-effect propositions can explain terrorism as a whole" (Tilly 2005, p. 22). In order to better differentiate the tendencies within the array of actors, Tilly offers a typology of four styles of groups or networks based on two variables: their expertise with techniques of coercion and how far abroad they operate. The first are what he refers to as "autonomists," those actors who operate close to home and have low levels of expertise with violence. Second are "militias" who operate close to home but have significant expertise in warfare or violence. Thirdly, "zealots" are those whose attacks occur abroad but do not possess significant skills in warfare or violence. Finally and of greatest concern for western nations are "conspirators" whose operations are directed abroad and possess significant experience and expertise with violence tactics. In the emergence of more connected eras of terrorism, we can see all four actors in play, but the latter is certainly in the minority.

## "Golden" Age of Terrorism

Terrorism moved decisively to the global stage during the 1970s during what has been referred to as the "Golden Age of Terrorism" (Bergen 2015). As Brigitte Nacos suggests, it was during this era that figures such as Carlos the Jackal or Andreas Baader and Ulrike Meinhof became household names through news reporting around the world (Nacos 2002, p. 4). This occurred in part because of a greater willingness to direct attacks against western states or western interests in non-western states and in certain instances greater levels of skill in using coercive force or greater lethality resulting from attacks. Most crucially however, terrorism strategies were either intentionally or inadvertently feeding into an increasingly globally networked media. Resistance

movements such as the FLN ably demonstrated that coercive violence alone was not sufficient to succeed. Violence in this sense was not the end goal, nor was it really a tactic toward a military outcome. It was a much a medium of communicating a message to domestic and international audiences (Stohl and Stohl 2017, pp. 363–364). This also meant that tactics and strategies of resistance could be studied and learned, giving rise to the proliferation and replication of similar styles of groups around the world. The power of these public information channels for these groups could be seen in attempts by the UK government to limit displays of public support for the IRA in the mid-1970s (Viera 1988) and ultimately regulate media reporting of terrorism in the early 1980s (Edgerton 1996). Terrorism was also becoming global because the concerns were no longer just local; the influence of global revolutionary worldviews could give rise to local or international resistances.

When thinking about global terrorism during the 1970s, a figure such as "Carlos the Jackal" quickly comes to mind. Born Ilyich Ramirez Sanchez, he was a globe-trotting revolutionary active in the youth movement of the Venezuelan communist party and undertook guerrilla warfare training with the Cuban intelligence agency in Havana (Kusher 2003, p. 322). He lived in London while his mother was studying in the London School of Economics and then attended university in Moscow. He committed deeply and actively to the Popular Front for the Liberation of Palestine (PFLP), undertaking training in Lebanon and committing several attacks against western targets across Europe. After killing hostages in a mission gone wrong, he was expelled from the PFLP and formed his own "Organization for Armed Struggle" made up of a transnational band of rebels. He subsequently carried out operations for the German Stasi and Russian KGB against western targets. It is not clear to what extent cinematic depictions of the international spy are based on his exploits or vice versa, but he was first much of the 1970s one of the most notorious international fugitives. He is now serving multiple life sentences for murder in a French prison. The majority of his operations clearly fit the model of a conspirator in the Tillyian sense, with most occurring abroad and demonstrating a high degree of mastery of the means of coercive violence. He was for the most part an exception, as most other instances of terrorism occurred closer to home and generally.

The most notorious groups operating throughout the 1970s were nationalist or revolutionary groups (Audrey 2004, pp. 44–45). Groups such as the Provisional Irish Republican Army, the Italian Red Brigade, the militant factions of the Palestinian Liberation Organization, the Basque separatists ETA, and Colombian revolutionaries FARC operated primarily against occupying forces in regions where they sought independence but in some instances directed attacks against wider targets such as those by the IRA in England, by ETA in Spain and France, and by the Palestinian Black September siege in Munich. These groups were large in scale and can perhaps be better understood as paramilitary groups that employed asymmetrical terrorism against the states with which they were at war. In this respect they can very much be understood as "militias" in Tilly's typology. Smaller revolutionary groups such as the Baader-Meinhof group's Red Army Faction, the Japanese Red Army, the Italian Red Brigade, and the American students' group the Weather Underground had ambitious revolutionary aims and were responsible for considerable violence and destruction but were never in a position to challenge for territorial control and can be better understood as "autonomists." The Japanese Red Army also undertook actions abroad such as taking hostages at the French embassy at The Hague in collaboration with Carlos the Jackal but without the same level of expertise. In this expeditionary capacity, they could be understood as "zealots" according to Tilly's typology. While the concern of these groups at first glance seems for the most part local independence, there is, however, a common set of Marxist-Leninist or Maoist revolutionary anti-capitalist or anti-fascist beliefs and shared militant tactics that can be identified across these organizations (Moghadam 2006, p. 56). While these groups may not have been the product of globalization, the ability to draw on a global revolutionary ideology and learn

asymmetrical tactics from one another was definitely an enabling factor.

Terrorism as noted earlier is not an objective term; it is dependent on the political and geopolitical alignments of those who portray the actors in question. The globalization of terrorism occurred during this era as a result of various cold war geopolitical conflicts in which paramilitary and guerrilla were supported by one superpower in their fight against a state backed by the other superpower. This can be seen clearly in the ideological alignment of groups from this era that are described as perpetrating terrorism throughout the 1970s; they were decidedly left-leaning or socialist-inspired. To counter what was seen as a spreading popular support for left-wing revolutions, the USA became involved in supporting conservative and hard-line paramilitaries against socialist or communist governments, creating armed and battle-hardened groups in contested regions of the world. In particular, a number of right-wing coups in Latin America, in particular Bolivia in 1971 led by General Banzer (Kohl and Farthing 2006, pp. 50–51), Argentina in 1973 led by General Pinochet, and Chile in 1976 led by General Videlo (Wright 2006), were followed by widespread state terror in the form of torture, murder, and disappearances. Support for asymmetrical strategies became much more common throughout the 1980s, with the USA supporting pro-government death squads in El Salvador (Arnson 2002, p. 96; Bonner 1984) and Guatemala (McClintock 1984), as well anti-government contras in Nicaragua (Chamorro and Morley 1985). While the military forces behind coups and US-backed leaders and paramilitaries tended not to be referred to as terrorist groups, they clearly possessed significant military expertise that was used to enact coercive terror and would qualify in Tilly's terms as "militias" in their domestic operations or "conspirators" when operating abroad.

While there are many examples of foreign interventions by powerful nations across the globe for geopolitical goals, the most notorious and consequential example of this was in Afghanistan. Both the Cold War superpowers intervened in various ways to support their geopolitical ambitions. Following a coup in 1978 that led to unstable leadership, the Soviet Union formally intervened in 1979 initiating a coup and installing a loyalist. This generated both domestic and international opposition, with Sunni, Shia, and revolutionary factions fighting the occupation and the United Nations General Assembly passing a vote protesting the intervention. The USA sort to counter the Soviet Union's occupation by supporting the war efforts of the many mujahideen forces in Afghanistan throughout the 1980s by supplying weapons, money, and training. It is estimated that the CIA trained as many as 12,500 fighters in guerrilla tactics, bomb making, and sabotage (Burke 1999). Furthermore, in collaboration with Pakistan's ISI, the CIA encouraged as many as 35,000 foreign fighters from 40 Muslim countries to join the war against Soviet Union forces (Rashid 1999, p. 31). While this was highly effective in drawing the Soviet Union into a bloody conflict that destroyed Afghanistan, it had much longer-term ramifications. This not only actively gave rise to generations of terrorist attacks but crucially served to create a militant transnational solidarity and global identity among foreign fighters. It was in this era that the foundations of global terrorism were laid.

## Global Age of Terrorism

It is at this point that a clear definition of globalization should be offered, for in the post-Cold War era terrorism and globalization become inseparable processes. Manfred Steger usefully describes globalization as "the expansion and intensification of social relations and consciousness across world-time and world-space" (Steger 2013, p. 15). This definition encompasses both material (social relations) and ideational (consciousness) elements of globalization and that these dynamics are not only spreading (expansion) but also that there condensation (intensification) in particular sites, such as cities with implications that are both spatial (world-space) and temporal (world-time) across the world. Important to note is these effects do not need to be felt all around the world or in the same manner. The effects of globalization will

always be localized in some way. This can be seen in the preceding sections where global phenomena such as colonialism, revolutionary movements, counterrevolutionary strategies, and geopolitical competition gave rise to local manifestations, in particular the violent incorporation of or resistance to these early forms of globalization. While the emerging global media meant that there was an awareness of these events around the world, the advent of a properly global mediasphere meant that the effects of spectacular public violence become immediate and resonant.

The emergence of a global age of terrorism was made possible by the emergence of global media industries, instantaneous global communications, and the increased mobility of those seeking to counter foreign interventions. While the seeds of the latter had been laid throughout the 1980s and would begin to manifest throughout the 1990s, the rise of instantaneous global media industry became abundantly clear in the 1990–1991 Gulf War. French poststructural theorist Jean Baudrillard published three provocatively titled essays before, during, and after the war entitled, respectively, "The Gulf War will not take place", "The Gulf War is not really taking place," and most memorably "The Gulf War did not take place" in the French newspaper *Liberation* and the English newspaper *The Guardian*. At the time these were widely received as ironic wordplay that diminished the gravity of a large-scale war. With the benefit of hindsight, it seems clearer that Baudrillard showed some foresight into the nature of the conflict. Firstly, due to the overwhelming aerial bombardment that was brought to bare on the Iraqi forces, the conflict was so asymmetrical that Baudrillard suggested it should be more accurately described as an atrocity rather than a war. Secondly and more profoundly, what was being witnessed in the dense and ever-present real-time global media representations was not an experience of what happened in the conflict but rather a simulation based on distanciated and stylized propagandistic imagery or what Baudrillard referred to as "simulacra." Instead of the emergence of a post-Cold War style of just war unconstrained by Soviet deterrence as envisioned by victorious western nations, what was being witnessed was the early stages of highly mediated and contested world in which narratives were multiple and truth harder to discern.

The world of course was thus more complex than this narrative of liberal internationalism suggested. An initial attempt to articulate the relationship between post-Cold War global order and terrorism was in Benjamin Barber's "Jihad vs. McWorld" article published in *The Atlantic* (Barber 1992). Barber posits two new polarities that will shape world order, especially in the Middle Eastern region. The first, "McWorld," is a neoliberal evolution of western globalization no longer constrained by the Soviet Union and only further energized by the power of corporations. This vision of western globalization takes on a post-sovereign bent in which corporations not only seek to engage foreign markets but also exert increasing influence over foreign policy. The McWorld position was best represented at the time by hyperglobalist commentators such as Francis Fukuyama in his "End of History" essay (1989), Kenichi Ohmae in *End of the Nation-State* (Ohmae 1995), and Thomas Friedman in *Lexus and the Olive Tree* (Friedman 1999). Barber suggested that as these companies, supported by neoliberal economic policies, enter into new markets and place pressure on countries to adopt economically, politically, and culturally liberal policies, there would be an inevitable resistance and even violent pushback. This pushback as it was suggested would take the form of "Jihad," which Barber represented as a reactionary traditional values that might be inspired by either nationalist or religious beliefs. By incorporating the reactionary tribal response to western globalization, Barber managed to temper the hyperglobalist outlook with a dose of realism, structured like the Cold War, very much in the manner of Huntington's "Clash of Civilizations" argument. Here was a vision of globalizing world in which terrorism would pose a great threat to post-Cold War democratic aspirations.

While Barber brought the new trends of emergent reactionary violence against forms of western globalization to attention, its formulation was altogether too binary. "Jihad" was framed as a local, particular, and backward set of "narrowly

conceived faiths," in a word tribal. "McWorld" was positioned as imposed from above and entirely homogenizing. In practice, however, neoliberal globalization incorporates local particularities and tribalisms into its structures. When Roland Robertson (1992) speaks of "glocalization," he is referring to the way in which universalizing aspects of globalization tend to merge and interact with the particular qualities of that locality. This, however, can be taken one step further if we understand that the local tribal dynamics are themselves products of global processes or interventions, namely, colonialism and the geopolitics of the Cold War. Seeking to break out of the binary of "Jihad" and "McWorld," Mitchell (2002) seeks to bring these two dynamics into a more dialectical and mutually constitutive relationship, suggesting that if anything we live in an age of "McJihad" "in which the mechanisms of capitalism appear to operate . . . by adopting the social force and moral authority of conservative Islamic movements. It may be true that we need a better understanding of the local forces that oppose the globalization of capital. But more than this we need a better understanding of the so-called global forces of capital."

Informed by his prior studies of Egyptian modernization programs in which widespread perceptions of backwardness belie the extent to which a "techno-politics" informed by western governance is at play (2002), Mitchell highlights that both globalization itself and the reactionary violence against have been equally constituted by long-standing military support, trade in oil, and a willingness to turn a blind eye to human rights abuses throughout the region. Viewed in this light, globalization and terrorism in this sense are deeply intertwined.

The September 11, 2001, attacks were the moment when the global nature of terrorism and counter-terrorism measures employed by western nations became undeniably global. The unavoidable ways in which it was a global event serve to confirm much of what has been discussed to this point. As has been documented in numerous YouTube compilation videos and explicitly suggested in the documentary by film-maker Adam Curtis, *HyperNormalisation*, 9/11 was prefigured throughout the 1990s by a large number of Hollywood action films in which planes and alien spaceships collide into significant US buildings, wreaking havoc and rendering the unimaginable on billions of screens around the world. In this sense before 9/11 occurred, it was already a simulated global event. When all those eyewitnesses in New York and the millions watching live around the world instinctively uttered the phrase "it was just like a movie," they were quite literally correct. These prefigurative imaginings of foreign threats, many quite literally out of this world, play a vital role in what de Goede describes as premediation of security (De Goede 2008). In this scenario the nature of the threat and the presumed response have already been determined in the public and policy mindset. This goes a long way to understanding why risk does not realistically factor into counter-terrorism responses, in which the financial cost and limits to freedom greatly exceed the literal danger posed by the threat of terrorism (Mueller and Stewart 2011).

## Conclusion

In 1990 Charles Kegley Jr. stated that "all terrorism is international." In some respects this is not entirely true. There are still many cases of highly localized violence within states, which while still being regarded as terrorism, has no great bearing on international affairs, and can be responded to through regular law enforcement or policing measures. A contemporary example of this is the emerging threat of right-wing terrorism that is becoming more and more prevalent within many western nations. The concerns of these groups tend to be with preserving a specific racialized vision of the status quo unified around a highly masculinized nationalism. The terrorism in this instance is not especially international as it seeks an isolationist position and is directed toward those who are identified (rightly or wrongly) as foreigners. To the extent that right-wing terrorism is directed at the state, it is because it facilitates multicultural policies or seeks to restrain the violent behavior of nationalists. They are most likely to function close to home as autonomists or

militias and rarely will they seek to operate abroad as zealots or conspirators. The use of coercive violence in this manner is not really international terrorism. The discursive effects of 9/11, an archetypal act of conspiratorial, highly coercive terrorism that is directed abroad, have seen all forms of terrorism – and indeed all tropes that can be conceivably be linked to terrorism – be treated as international terrorism. The international interpretive frame means that threats (real or merely perceived) are treated as threats to national security that should be mediated using the diplomatic and strategic tools available for the conduct of foreign policy and war. Many instances of terrorism of course do not rise to this.

What can be said, however, is that all terrorism is now global. This distinction here is that while certain domestic forms of terrorism will not affect international actors, nor will the perpetrators likely be perceived as international actors themselves, terrorism cannot operate in a vacuum. All future acts of terrorism, from the most local and parochial act of asymmetrical violence to the most expansive ambitions of highly trained and well-traveled operatives, will occur in the context of immersive collective cultural awareness of things like 9/11, the subsequent war on terror including Guantanamo Bay, the killing of Osama bin Laden, and the deployment of drones. There is now a global cultural production of knowledge related to terrorism and counterterrorism that will have certain local specificities but also transnational commonalities. This can be seen even in the highly patriotic and isolationist beliefs of far-right extremist groups. While they decry forms of multilateralism abroad that might diminish national sovereignty or multiculturalism domestically that might diminish their conception of national culture, there is nonetheless a transnational learning and even at times solidarity among nationalist groups in different countries.

If a nationalist group uses coercive asymmetrical violence in a country that is not under occupation and does not target foreign nationals, it is not international, but it is likely to still be global. Far-right nationalist groups will share intellectual resources by reading each others' tracts in order to develop their own arguments. Far-right groups will also celebrate electoral success of nationalist groups in other countries. In some instances they will cooperate in supranational institutions of the EU or travel to other countries to give speeches. There is almost a contradictory transnational parochialism that rejects but at the same time mimics cosmopolitan solidarity among progressive movements. Far-right groups will also adopt common enemies in spite of being in countries that face very different patterns of immigration or geopolitical dangers.

This chapter has suggested that globalization and terrorism have come together in a way that creates global media events, which stage violent modes of communication between militarily, economically, and culturally asymmetrical actors. There is not sufficient space here to have detailed all the myriad ways in which globalization, the war on terror, and the post war on terror approach to counterterrorism have become so deeply enmeshed and intertwined. That would be the topic of a future chapter in itself. What this chapter has sought to do is to sketch out a conception of what is commonly recognized as terrorist acts, in spite of the conceptually imprecise nature of the terms terror, terrorist, and terrorism. The decline of colonialism and the rise of desire for national independence saw the emergence of a broadly common set of asymmetrical tactics to achieve these ends. As the world moved into a state of Cold War balanced precarity, these methods morphed, became more mobile, in some cases more militarized, and increasingly carried out against foreign actors or for global audiences. Tragically this period of increasingly violent competition between superpowers using asymmetrical proxy violence sowed the seeds of genuinely global and increasingly violent actors. The cycle of violent terrorist reprisal in the twenty-first century will be a key part of the story of the dark side of globalization.

## Globalization and the Nuclear Nonproliferation Regime

Aiden Warren
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

Notwithstanding the significant reductions in nuclear arsenals made over the last several decades, it is evident that the risks emanating from nuclear weapons and their associated materials have actually expanded. More states in more unstable regions have attained such weapons, terrorists continue to pursue them, and the command and control systems in even the most sophisticated nuclear-armed states remain susceptible to not only system and human error but, increasingly, to cyber-attack (Evans and Yoriko 2009; Martin 1988; King 2009). Additionally, the failure of *existing* nuclear-armed states to disarm, the inability to impede *new* states obtaining nuclear weapons, the potential of non-state actors gaining access to such weapons and their concomitant material, and the challenge presented by the expansion of nuclear energy plants *all* present serious security challenges in the twenty-first century (Evans and Kawaguchi 2009).

As this chapter will elucidate, there has been an ongoing attempt to mitigate the continual proliferation of such weapons through a series of initiatives, organizations, and treaties. Through the creation of the Nuclear Nonproliferation Treaty in 1968, a regime emerged encompassing an assortment of instruments gauged toward addressing areas pertaining to and emanating from: proliferation, testing, nuclear-free zones, the security of nuclear material, nuclear terrorism, and the commercial application of nuclear materials (to name a few). While such mechanisms, explained over the course of the chapter, have made some important inroads, they remain precariously balanced, particularly as all nuclear states today continue to steadily modernize their respective stockpiles and flout their NPT obligations. Without a definitive set of restrictions on the pace and scope of nuclear modernization, the goals of deep cuts in, and eventual elimination of, nuclear weapons remain intangible and increasingly improbable. If the NPT regime cannot be *re*-emboldened, the unremitting reassertion of the significance of nuclear weapons, sustained by an amplified global nuclear rivalry and renewed arms race, threatens to extend the nuclear era indefinitely into the twenty-first century (Kristensen 2014).

### Defining the Nuclear Nonproliferation Regime

While the 1968 Treaty on the Nonproliferation of Nuclear Weapons (NPT), sponsored by the United Nations, emerged as the central pillar of the nonproliferation regime, it was preceded chronologically by *seven* supporting pillars. These encompassed (1) the *Atoms for Peace* program designed to share technology with nonnuclear states for peaceful uses, (2) the *International Atomic Energy Agency* (IAEA) needed initially to monitor Atoms for Peace activities but soon found to provide a vital role supporting other NPT activities, and (3) the *nuclear-weapon-free zones* (NWFZs), the first created in 1959, designed to control, monitor, or prohibit nuclear weaponry in a specific geographical area. Diplomatic efforts, beginning in the late 1950s, aimed at banning nuclear testing – long considered a vital pillar of nonproliferation – initially produced the (4) *Limited Test Ban Treaty* of 1963. Unfortunately, a comprehensive nuclear test ban (CTBT), although signed is still not in force well into the twenty-first century. Restraints on transferring materials necessary for the development of nuclear weaponry were established, in 1974, by the informal (5) *Nuclear Suppliers Group*. With

the collapse of the Soviet empire at the end of the Cold War, the US-sponsored (6) *Cooperative Nuclear Threat Reduction* program (1992) sought to prevent Russian and other states' nuclear materials and weapons from falling into the hands of rogue nations or terrorists. Additional measures have been added to strengthen IAEA safeguards in providing security for nuclear materials in transit and preventing a black market in weapon technology. The necessity of the latter was highlighted by the activities of Pakistani scientist Abdul Qadeer Khan's network. The tense situation in South Asia between India and Pakistan, and a March 2011 tsunami that destroyed Japan's Fukushima nuclear plant, has prompted recognition of the considerable dangers posed by an attack on civilian nuclear facilities during military hostilities leading to the need to revisit safety measures. The (7) *Missile Technology Control Regime* (1987), which seeks to restrict the traffic in missiles and missile technology – the nuclear weapon delivery systems – also complements nuclear nonproliferation activities (Burns 2009).

## The Nuclear Nonproliferation Treaty

Although several states recognized early the need for a formal arrangement to limit the spread of atomic and later nuclear weapons, progress was slow. Despite an initial lack of success, the United Nations eventually played a major role in the negotiations leading to the Nonproliferation Treaty (NPT). Beginning with its first session in January 1946, at London, the General Assembly unanimously decided to establish the United Nations Atomic Energy Commission (UNAEC). Specifically, the commission was charged with defining proposals for the control of atomic energy to ensure its use for peaceful purposes, for the elimination of atomic weapons from national arsenals, and for effective safeguards against violations. There were fundamental differences in the approach of nuclear and nonnuclear states to the formulas for limiting or halting the spread of nuclear weaponry; many of these differences would persist well beyond the signing of the Nonproliferation Treaty (NPT) in 1968 (Graham Jr 2002; Brands 2006).

With respect to negotiations, the Eighteen Nation Disarmament Committee's nonaligned members argued that a nonproliferation treaty must not simply divide the world into nuclear "haves" and "have nots" but must balance mutual obligations. They argued that in exchange for the nonnuclear states ending the "horizontal" proliferation of nuclear weapons, the nuclear powers should end their "vertical" proliferation. They listed the specific steps in the following order: (a) a comprehensive nuclear test ban; (b) a complete cessation of the production of fissionable material for weapon purposes; (c) a freeze on, and gradual reduction of, nuclear weapon stocks and their means of delivery; (d) a ban on the declared use of nuclear weapons; and (e) security assurances to the nonnuclear states by the nuclear powers. These nonaligned states' demands garnered the endorsement of some nonnuclear American and Soviet allies. While the two nuclear superpowers would not agree to listing these specific measures in the operative part of the treaty, they eventually accepted a compromise formula. After extensive negotiation and pressure, the USA and USSR agreed to a provision relating to halting and reversing the nuclear arms race – Article VI.

The agreed text of Article VI read: "Each of the Parties to the Treaty undertakes to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control" (NPT text in Arms Control and Disarmament Agency 1990). Although several individuals and states still considered the draft NPT to be inherently discriminatory, they also believed that it was significant as a first step that could lead to the elimination of all nuclear weapons. The Nonproliferation Treaty was signed on July 1, 1968, but the arguments over Article VI were far from over.

## NPT Review Conferences

The NPT provided for conferences to be held every 5 years to review the operation of the Treaty, "with a view to assuring that the purposes of the Preamble and the provisions of the Treaty are being realized." The first four review conferences were held in 1975, 1980, 1985, and 1990. In accordance with Article X, a conference had to be held in 1995, to determine "whether the Treaty shall continue in force indefinitely, or shall be extended for an additional fixed period or periods." Indeed, many observers considered the 1995 conference as a significant juncture in creating a permanent NPT regime; a regime that would continue working toward halting the spread of nuclear weapons and facilitating peaceful nuclear cooperation. There were many states with divergent interests. Some wanted an "updated and legally binding negative security assurances – pledges by the nuclear weapons states not to attack non-nuclear states with nuclear weapons – and positive security assurances – pledges by the nuclear states to come to the aid of non-nuclear weapon states threatened or attacked with nuclear weapons." Other states, primarily those in the Middle East, underscored the problem of Israel not being an NPT party (Graham Jr 2002).

Despite some concerns, the final agreement was adopted by consensus on May 11, 1995, and encompassed three defining elements: the permanent extension of the NPT, the statement of principles and objectives on nuclear nonproliferation and disarmament, and a strengthened review process (Graham Jr 2002). The 2000 Review Conference occurred following a grim period for the nonproliferation movement. The Comprehensive Test Ban Treaty, signed in 1996, was rejected by the US Senate 3 years later; nuclear tests were held by India and Pakistan in 1998; the incoming George W. Bush administration threatened cancellation of the Anti-Ballistic Missile (ABM) Treaty; the USA, UK, France, and Russia still adhered to declared first-use nuclear options; and no progress on negotiated nuclear reductions had taken place. Despite this state of affairs, the conference was surprisingly one of the most successful in arriving at a positive consensus on issues indicating a continued worldwide commitment to the basic principles of the NPT. This respite was in large measure managed by the New Agenda Coalition – made up of Mexico, South Africa, Brazil, Ireland, Sweden, New Zealand, and Egypt – that pressed nuclear weapon states for progress on disarmament before the enthusiasm for nonproliferation dissipated.

As the 2005 Review Conference loomed on the horizon, the 2000 conference's 13 steps came to be seen as a triumph of optimism over reality. There had been a few successes during the previous 5 years. Washington listed the USA-Russia Strategic Offensive Reductions Treaty (2002), the USA's elimination of a number of missile submarines, heavy bombers and deactivation of the "Peacekeeper" ICBMs, removing its nuclear triad from alert status, and a moratorium on the production of fissile material for nuclear weapons (1992) as positive steps. Other nuclear weapon states pointed to their accomplishments. These, as listed by Scheinman, were: "Russia, the United Kingdom, and France have ratified the CTBT; France and the United Kingdom have taken steps making elements of their nuclear weapons consistent with the principle of irreversibility; and the United Kingdom and France have taken some steps toward reducing the operational status of their weapons systems. China had committed to a policy of no-first-use of nuclear weapons and, along with France and the United Kingdom, Beijing has ratified an Additional Protocol to its safeguards agreement with the International Atomic Energy Agency (IAEA)" (Scheinman 2005). Then, unexpectedly, Libya was persuaded in 2003 to dismantle its secret, yet nascent, nuclear weapon program and agree to IAEA inspections and to its Additional Protocol. There remained, nevertheless, several of the 13 steps that were not undertaken and, in some instances, a clear regression.

Disappointments outweighed achievements. In January 2003, North Korea announced its intent to withdraw from the NPT, and in December of the

said year, Iran was initially charged by the IAEA with clandestine nuclear activities. China and Russia's unsuccessful attempt during the past 5 years to tie negotiations for the prevention of an arms race in space with a fissile material cutoff treaty (FMCT) hindered progress on the latter. Additionally, China's modernization of its nuclear weapons and Russia's withdrawal of its pledge of no first use, along with its insistence on the right to use nuclear weapons in response to attack by any weapon of mass destruction (WMD), raised further doubts pertaining to these nuclear weapon states' commitment to disarmament. Further, Britain's 2000 pledge not to use nuclear weapons against a nonnuclear member of the NPT was complicated by its membership in NATO which reserves the right to use nuclear weapons first in a conflict. Although NATO believes such use was "extremely remote," British officials declared that nuclear weapons would be employed only in "extreme circumstances of self-defence" (Scheinman 2005).

The 2005 NPT Review Conference saw parties unable to agree on a final document, primarily based on the divisions between NWS and nonnuclear weapon states (NNWS). NWS were mainly focused on emboldening nonproliferation efforts and cases of noncompliance with the treaty, while NNWS concentrated more on the lack of advancement toward meeting disarmament obligations as stipulated in Article VI of the treaty. In the context of 2010, the conference's final document comprised an action plan of 64 items across the NPT's three columns – nuclear disarmament, nonproliferation, and peaceful uses of nuclear energy. The plan included a P5 unofficial directive in which they would report on progress made to the NPT in 2014 and take practical steps on implementing the 1995 Middle East resolution, such as summoning a 2012 conference that would bring together states from the region. While ultimately not achieved, it was an important step for the NPT because it was the first time a deadline for action had been included in a consensus decision (Nuclear Threat Initiative 2015). The ninth review conference of the Treaty on the Nonproliferation of Nuclear Weapons (NPT) was held in New York on 27 April–22 May 2015 under the presidency of Ambassador Taous Feroukhi of Algeria. Like its predecessors in 1980, 1990, and 2005, it was unable to attain a consensus final document. Unlike 2005, when it was evident from the beginning that there would be limited successes, there was an anticipation in the lead-up to 2015 that it might be possible to expand on the 2010 consensus final document, which was both progressive and practical. Many analysts believed it could be possible for the 2015 conference to evaluate the application of the 2010 Action Plan (including a set of recommendations in the context of the Middle East), and perhaps leading to the prioritization of next steps (Potter 2016).

## Negotiating a Comprehensive Nuclear Test Ban

Despite attempts by many officials in Washington to ignore the fact, the nonnuclear states had made it evidently clear that a comprehensive nuclear test ban had become a central tenet to maintaining the Nonproliferation Treaty. The four previous NPT review conferences repeatedly, and each time more stridently, emphasized the superpowers' apparent lack of effort to achieve a total ban on testing. Since the only conclusive evidence that a state had acquired or built a nuclear weapon would be a test explosion, it could secretly prepare a small stockpile of plutonium or of highly enriched uranium and, at a time of its choosing, embark on a testing program. As such, a total ban on testing, coupled with inspections by the IAEA, could greatly reduce this scenario.

For the CTBT to enter into force, however, it had first to be ratified by 44 nuclear states and nuclear threshold states, many of which were waiting for the USA to act. Unfortunately for its supporters, the US Senate rejected ratification on October 13, 1999, by a vote of 48–51 – failing to gain even a majority in support of the treaty and, of course, significantly below the two-thirds needed for approval. The CTBT's defeat, according to one observer, was "an accident of politics, an executive-legislative stalemate that resulted from clashing institutional interests, partisan struggle, intraparty factionalism, and

personal vindictiveness. Certainly it was a story of zealotry, conspiracy and incompetence in which all the key players share responsibility for an outcome that only a minority really desired." Underlying all of the political activity was an issue of substance – "the effectiveness of the stockpile stewardship program, the capabilities of monitoring and challenge inspections" and the future of deterrence – that in some minds were uncertain factors (Deibel 2002).

Three years after the Senate's action, the National Academy of Sciences reviewed the arguments offered by critics of the treaty, particularly those that questioned the adequacy of international monitoring and long-term effectiveness of the US nuclear stockpile without new tests. The panel of experts concluded: "the U.S. nuclear stockpile can be safely and reliably maintained without explosive testing." Although surveillance of weapon components and retention of high-quality scientists is imperative for the upkeep of U.S. nuclear weapons, "[N]o need was ever identified for a program that would periodically subject stockpile weapons to nuclear tests." A separate 2009 study by JASON, an independent technical review panel, reported that the "lifetimes of today's nuclear warheads could be extended for decades, with no anticipated loss in confidence" (Kimball 2011; NAS Executive Summary 2002).

When Russia ratified the CTBT in 2000, international attention (and blame) became focused on the USA as the nation primarily responsible for the failure of the treaty to enter into force. Thus, the CTBT has languished in the US Senate, as neither President George W. Bush, an opponent of arms control measures, nor President Barack Obama who has been sympathetic to the CTBT, have been able to revive it. While the Bush administration found the International Monitoring System (IMS), with its stations in Russia, China, and other sensitive regions, provided useful information, it reduced America's annual dues assessment, thus making it difficult for the CTBT Preparatory Commission to collect dues from other nations. Nonetheless, in 2011, more than 80% of the IMS facilities had been completed. Despite the failure of the CTBT to enter into force, a general moratorium on nuclear testing in effect since 1993 has been more or less honored. From 1945 to 2011, a total of 2052 nuclear tests have taken place worldwide: the US 1,030; USSR/Russia 715; UK 45; France 210, all prior to 1993; China 45 with six since 1993; India three with two since 1993; Pakistan two since 1993; and North Korea five since 1993 (Coyle 2012). As of August 2016, 183 states had signed the CTBT and 164, including Russia, had ratified it. India, North Korea, and Pakistan have not signed the treaty. Nine conferences have been held to facilitate entry into force, every other year, most recently on September 29, 2015. In years between these conferences, varying foreign ministers meet to encourage entry into force of the CTBT. A ministerial meeting was held on June 13, 2016, to observe the twentieth anniversary of the signing of the CTBT (Nikitin 2016).

## Nuclear Weapon-Free Zones

Nuclear weapon-free zones (NWFZ) are logical members of the nonproliferation regime because they commit member states to follow the regime's basic principles – forsaking production, testing, stationing, or any use of nuclear weaponry. What gives these organic agencies significance is that they are translating nonproliferation principles from documents to action. Moreover, nuclear weapon-free zones comprise a significant pillar supporting the nonproliferation regime since they are a means of limiting or neutralizing the activities of the nuclear weapon states in stipulated geographical areas. While there is no authoritative definition of a nuclear weapon-free zone, there are certain accepted elements implicit in the concept. These include (1) no manufacture or production of nuclear weapons within the zone, (2) no importation of nuclear weapons by nations within the zone, (3) no stationing or storing of nuclear weapons in nations within the zone, and, preferably when obtainable, (4) a pledge by nuclear weapon states not to use or to threaten to use nuclear weapons against nonnuclear nations within the zone. While each nation within the zone might create nuclear energy facilities for peaceful uses, they must agree to comprehensive

safeguards established by the International Atomic Energy Agency (IAEA), to verify that the treaty members were not acquiring illicit nuclear weaponry. Finally, the NWFZs are to be in force indefinitely, and none of the parties is to be permitted special conditions.

The frequently denigrated multilateral Antarctic Treaty (1959) became de facto the first nuclear weapon-free zone. In addition to assuring that the continent would be set aside for peaceful uses, Article 1 prohibited all types of military activities, and Article 5 specifically prohibited any nuclear explosions or the disposal of nuclear wastes without international assent. Signatory "compliance with the disarmament mandate throughout the Antarctic has clearly been met," Christopher Joyner has noted. "Since 1961, the Antarctic Treaty system has functioned exceedingly well as the institutional framework for preserving peace and stability, fostering scientific cooperation, and promoting standards for environmental preservation and conservation." The Antarctic Treaty has been successfully monitored because of the stipulated total prohibition rather than ceilings or ratios (Joyner 1993).

Other multilateral agreements that prohibited nuclear weapons in a specific, non-populated area – outer space (1967) and the seabed (1971) – succeeded in gaining general approval and became essentially nuclear weapon-free zones. The UN, in December 1979, sponsored an elaborate pact that sought to augment the demilitarization of "the moon and other celestial bodies" by prohibiting the placing in orbit of "objects carrying nuclear weapons or any other kinds of weapons of mass destruction or place or use such weapons on or in the moon." Also forbidden was the establishment of any military installations, fortifications, or testing of military devices on the moon. The Outer Space Treaty committed signatories "not to place in orbit around the Earth any objects carrying nuclear weapons or any other kinds of weapons of mass destruction, install such weapons on celestial bodies, or station such weapons in outer space in any other manner." In addition, the article prohibited "the establishment of military bases, installations and fortifications, the testing of any type of weapons and the conduct of military maneuvers on celestial bodies." Bolstering the pact, the nuclear test ban accords – and the abrogated ABM treaty (1972–2002) – added constraints against testing various weapons in outer space. Arms control treaties dealing with strategic weapons prohibited interference with national technical means of verification, thereby permitting the use of reconnaissance satellites; however, antisatellite weapons have not been banned and pose a serious, continuing concern. The Seabed Treaty prevents the installation of nuclear weapons on the ocean floor beyond national territorial waters, and, since no nation contemplated any such deployment, the treaty met with little opposition. No reported violations of these agreements have been found (Goldblat 1983; Garthoff 1980/1981; Ramsberg in Burns 1993; United Nations 1985).

The unsuccessful Rapacki proposals – offered by the Polish Foreign Minister in 1957 and 1962 – to prevent nuclear weapons being stationed in Poland, Czechoslovakia, and West and East Germany ultimately became a model for *five* negotiated nuclear weapon-free zones in populated regions. Each designated zone includes the entire territory of all of its parties, including all land holdings, internal waters, territorial seas, and archipelagic waters. The territorial clauses have caused some differences. The Treaty of Tlatelolco (1967), for example, claims to extend hundreds of kilometers from the signatories' territories into the Pacific and Atlantic Oceans. Consequently, the nuclear weapon states, citing their freedom at sea rights, assert that these limits do not apply to their ships and aircraft that might be carrying nuclear weapons. The Rarotonga Treaty (1985) posed a similar freedom of the seas issue for Washington. The inclusion of the Chagos Archipelago, which includes the US military base at Diego Garcia in the Indian Ocean, as part of the African nuclear weapon-free zone, prompted yet another dispute. Neither the USA nor the UK accepted the claim that Diego Garcia was subject to the restrictions stipulated in the Pelindaba Treaty (Warren and Siracusa 2017).

Prompted by the Cuban missile crisis, 33 nations in Latin America and the Caribbean

agreed not to test, develop, or import nuclear weapons and not to permit foreign-controlled nuclear weapon bases in the region. Compliance with the treaty obligations is overseen by the Agency for the Prohibition of Nuclear Weapons in Latin America, and the Caribbean (OPANAL), based in Mexico City. The treaty initially confronted the Brazilian military's efforts to develop nuclear weapons; however, the "Bilateral Agreement for the Exclusively Peaceful Uses of Nuclear Energy" (1991) pledged Brazil and Argentina to adhere to the Tlatelolco pact. The Treaty of Rarotonga (1985), designed to dissuade France from testing nuclear devices in the Tuamotu Archipelago which succeeded in 1996, includes Australia and New Zealand, along with nearby island states, and was modeled after the Tlatelolco Treaty. It prohibits nuclear testing and waste disposal in the region and allows regional ports to prohibit the entry of ships carrying nuclear weapons. In addition to the Tlatelolco prohibitions, Rarotonga relies on the IAEA to verify any nuclear materials present in the treaty region. The USA signed but delayed ratifying the agreement, fearing it would restrict the movement of the navy's warships carrying nuclear weapons. The Reagan administration's talk of a winnable nuclear war prompted New Zealand, in February 1984, to ban a US destroyer from its ports because the USA refused to indicate whether or not it carried nuclear weapons. The episode caused a rift between the two countries prompting the USA to severe diplomatic contacts with New Zealand from 1985 to 1993 (Redick 1993; Siracusa and Coleman 2006).

The Treaty of Bangkok (1995) completed a quest for a Southeast Asia Nuclear Weapon-Free Zone that began in November 1971, when the Association of Southeast Asian Nations issued a Declaration on a Zone of Peace, Freedom, and Neutrality. Signatories to the treaty pledged "not to develop, manufacture or otherwise acquire, possess or have control over nuclear weapons; station nuclear weapons; or test or use nuclear weapons anywhere inside or outside the treaty zone; not to seek or receive any assistance in this; not to take any action to assist or encourage the manufacture or acquisition of any nuclear explosive device by any state; not to provide source or special fissionable materials or equipment to any non-nuclear weapon state." In addition to IAEA safeguards, verification occurs through reports and exchange of information among the member states and oversight by a Commission for the Southeast Asia Nuclear Weapon-Free zone. The Pelindaba Treaty (1996) arrived 32 years after the Organization of African Unity formally declared its aim to create a nuclear-free Africa. In 1990, South Africa's unilateral dismantlement of its nuclear bombs played a leading role in the final negotiations. As with the other NWFZs, signatories pledged not to conduct research on, develop, test, or stockpile nuclear explosive devices; to prohibit the stationing of nuclear devices on their territory; to maintain the highest standards of protection of nuclear materials, facilities, and equipment; and to prohibit the dumping of radioactive waste. The pact also created an African Commission on Nuclear Energy (Warren and Siracusa 2017).

The Central Asian States of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan created a nuclear weapon-free zone in 2006 – the Treaty of Semipalatinsk. In the past, these states had nuclear weapons stationed on their territories and still "live in a nuclear-armed neighborhood" that consists of Russia, China, Pakistan, India, and Israel. Additionally, Russia and the USA have military facilities in the Central Asian states (SIPRI Yearbook 1998; Parrish and Potter 2006). During the Cold War, the Soviet Union generally supported NWFZ proposals, while the USA more often than not posed reservations. Washington refused to even consider the Rapacki proposals for Central Europe, though this was mainly because NATO's defense was anchored to the use of nuclear weapons. Since the Rarotonga Treaty could restrict the passage of the USA's nuclear weapons equipped warships, Washington refused to consider ratification of the pact. The USA joined France in objecting to the Treaty of Bangkok's unequivocal security pledges and to its definitions of area; Washington also insisted the provisions regarding the innocent passage of its warships and aircraft were "too restrictive" and has insisted on modifications. Initially, a

serious obstacle to completion of the Pelindaba Treaty was the status of Diego Garcia, a large island in the Indian Ocean, administered by London and employed as a military base by Washington. Consequently, neither nuclear power recognized Diego Garcia as being within the area covered by the treaty, and thus, Russia refused ratification until the status of Diego Garcia had been resolved. While Russia and China accepted the Treaty of Semipalatinsk's final agreement's provisions, the USA, the UK, and France were critical of several provisions of the treaty and indicated that they would not sign those protocols unless their concerns were resolved (Warren and Siracusa 2017).

In May 2011, President Barack Obama asked the US Senate to ratify the disputed protocols of the Pelindaba and Rarotonga treaties because they would "extend the policy of the United States not to use or threaten use of nuclear weapons against regional zone parties" that are members of the Nuclear Nonproliferation Treaty. Republican Senator Jon Kyl of Arizona immediately objected to this revision of George W. Bush's secret 2002 National Security Presidential Directive-17 that explicitly stated the USA would consider nuclear weapons among retaliation options if it were the target of any weapons of mass destruction. He feared that Obama's approach, as stated in the president's 2010 revised Nuclear Posture Review Report, "would limit the instances in which the President would use nuclear weapons to defend the United States and its allies from attack." In this regard, the administration argued that advances in US military capabilities actually allowed Washington to forego the nuclear response option. Washington's original objections regarding the two NWFZ treaties apparently had been resolved. The US state department review of the Pelindaba pact concluded that "Diego Garcia is not part of the 'territory' of the zone," a position also taken by Russia in ratifying the treaty in March 2011, with a reservation that its responsibilities would not apply to Diego Garcia. As for the Rarotonga treaty, Washington pledged not to station or test nuclear weapons in the US territories of American Samoa and Jarvis Island (Nurja 2011).

## Other Initiatives That Support the Global Nonproliferation Regime

If the global nonproliferation regime can be considered a broad church with the NPT as its central and defining pillar, there are also a myriad of other initiatives, organizations, and political instruments, both formal and informal, that work to support the regime's central goal of mitigating WMD threats. It is here that the next section looks briefly at the Cooperative Threat Reduction Program, the Global Threat Reduction Initiative, and the Nuclear Suppliers Group.

### Cooperative Threat Reduction Program

The sudden demise of the Soviet Union and the chaos that ensued lead to the USA's Cooperative Threat Reduction (CTR) program (otherwise referred to as the Nunn-Lugar program after its sponsors Senators Sam Nunn (D-GA) and Richard Lugar (R-IN)). The Nunn-Lugar legislative Act of November 12, 1992, provided US financial assistance to the Commonwealth of Independent States, especially Russia, to consolidate the former Soviet nuclear arsenal and ensure their custodial safety. The 10-year, four billion dollar program was designed to:

1. "Destroy nuclear weapons, chemical weapons, and other weapons."
2. "Transport, store, disable, and safeguard weapons in connection with their destruction."
3. "Establish verifiable safeguards against the proliferation of such weapons."

In two decades of CTR efforts, much has nevertheless been accomplished: 7519 nuclear warheads deactivated; 768 intercontinental ballistic missiles (ICBM), 498 ICBM silos, 148 mobile ICBM launchers, 651 submarine launched ballistic missiles (SLBM), 476 SLBM launchers, 32 ballistic missile-capable submarines, 155 strategic bombers, 906 air-to-surface missiles, and 194 nuclear test tunnels have been destroyed; 24 security upgrades implemented at nuclear weapon storage sites; and 469 train shipments of nuclear weapons were moved to more secure, centralized storage sites. The program purchased

500 metric tons of highly enriched uranium from dismantled warheads and helped remove all nuclear weapons from the Ukraine, Kazakhstan, and Belarus – states that once held the world's third, fourth, and eighth largest nuclear arsenals. Additionally, 19 biological-agent monitoring stations have been established (Walker 2006; Chuen 2007; Cooperative Threat Reduction Annual Report to Congress 2008).

In 2009, a Congressional-mandated report by the National Academy of Sciences – "Global Security Engagement: A New Model for Cooperative Threat Reduction" – recommended expanding the Nunn-Lugar program to provide a more global engagement to counter twenty-first century terrorist threats. The CTR program continues "to make us safer by achieving meaningful progress in the destruction and dismantlement of massive Soviet weapons systems and the facilities that developed them," Senator Lugar declared. However, "there is much more work to do in combating biological, nuclear, and chemical threats" through the global cooperative program (National Nuclear Security Administration 2011). In this regard, the program continues to play a significant role in impeding threats posed by terrorist organizations or those proliferant states seeking to attain weapons of mass destruction material, equipment, and expertise. In adapting to new and emerging twenty-first century theaters of conflict and tension, the global threat reduction programs now focus on "front-line states such as Iraq and Yemen, critical states such as Indonesia, Philippines, and Egypt, and in regions where terrorist threats are on the rise, such as South Asia, the Middle East, and North Africa" (Office of Cooperative Threat Reduction 2016).

### Global Threat Reduction Initiative

Established in May 2004, the Global Threat Reduction Initiative (GTRI) is a collaborative program aimed at securing vast stocks of dangerous nuclear material scattered around the world. Where the CTR's focus is on nuclear weapon material in states of the former Soviet Union, the GTRI is a complementary program involved in "repatriating or otherwise securing nuclear fuel" from peaceful use facilities and converting these facilities "to use new, more proliferation-resistant technology." According to Eric Hundman, "...promoting peaceful nuclear technology and selling nuclear fuel creates a logical contradiction, however, often nuclear technology is inherently dual-use" (Hundman 2006). As such, in seeking to reduce and protect susceptible nuclear and radiological material situated at civilian sites globally, the GTRI undertakes a tri-pillar approach in mitigating terrorist's access to nuclear and radiological materials. Firstly, it aims to *convert* research reactors and isotope production facilities from the use of highly enriched uranium (HEU) to low-enriched uranium (LEU) or authenticate their closure; secondly, it *removes* or sanctions the composition of excess nuclear and radiological materials; and thirdly, it *protects* high-priority nuclear and radiological materials from theft (National Nuclear Security Administration 2014).

Since its beginning, the GTRI has made substantial progress in decreasing the danger posed by susceptible civilian nuclear and radiological materials, which could be used by non-state actors to make an improvised nuclear device or a radiological dispersal device (RDD) or "dirty bomb." The GTRI and its precursor programs have converted or verified the closure of 88 HEU research reactors and isotope production facilities; removed or ascertained the nature of more than 5140 kg of HEU and plutonium, ample material for more than 205 nuclear bombs; safeguarded more than 775 bombs worth of HEU and plutonium linked with the BN-350 reactor in Kazakhstan; secured more than 1700 radiological sites globally containing millions of curies, a sufficient quantity to produce tens of thousands of large dirty bombs; recuperated more than 36,000 "orphan and disused radiological sources in the United States; and recovered 810 radioisotope thermoelectric generators from Russia containing millions of curies of activity" (National Nuclear Security Administration 2014; U.S. Department of Energy 2014).

### Nuclear Suppliers Group

Between 1971 and 1974, delegates from 15 nations met informally at Vienna, headed by

Professor Claude Zangger of Switzerland (hence, also known as the Zangger Committee), to control exports of nuclear materials. In August 1974, the committee established guidelines, adopted by consensus, that were implemented through national export control systems. The guidelines included a "trigger list" – so-called, because their proposed export triggered the Group's concern. The list consisted of material, equipment, and facilities that if diverted from peaceful uses could contribute to a nuclear weapons program. Following the 1974 Indian nuclear test, the USA, the Soviet Union, the UK, France, West Germany, Canada, and Japan replaced the Zangger Committee with the Nuclear Suppliers Group (NSG) and began meeting in London in April 1975. In September 1977, the group adopted an expanded version of the Zangger list, *Guidelines on Nuclear Transfers*, which was sent to the IAEA in January 1978. A 1992 meeting of the group resulted in a reexamination of thousands of items on the dual list and a tightening of export restrictions (Mendelson 2002; Horner 2010).

As an informal multinational organization with 48 members, the NSG is operated by consensus without any arrangement for resolving differing interpretations of its guidelines. These are quite broad and provide loopholes; for example, Russia made and conducted arrangements with India for reactors and fuel, justifying their transactions on the basis of Moscow's interpretation of NSG guidelines that other members thought overly expansive. In 2008, India was granted an exception to the guidelines, urged by the USA, allowing it to receive nuclear exports, although it is not a member of the NPT and did not have full-scope safeguards. Additionally, in 2010, a question of NSG member China's planned sale of two reactors to Pakistan became a contentious issue since the said state is not a member of the NPT or under IAEA safeguards. In response to these developments, the NSG has discussed the creation of more rigorous standards for exports relating to enriched uranium and spent fuel reprocessing, including adherence to the NPT, full-scope safeguards, and enhanced IAEA inspection privileges. Despite the lack of a consensus, Canada, France, Germany, Italy, Japan, Russia, the UK, and the USA decided in June 2010 to implement these proposed standards as national policy for a year (Mendelson 2002; Horner 2010).

According to James Goodby, the NSG has become "a clearinghouse for nuclear-related exports" and remains "one of the most effective international anti-proliferation tools." Of course, not everyone agrees with this enthusiastic endorsement. "NPT parties have good reason to complain," former state department official Fred McGoldrick writes, "because the actions of NSG members have made a mockery of Article IV of the NPT by giving non-NPT parties India and Pakistan the same benefits as NPT parties without the accompanying obligations." He charges both Moscow and Washington with undermining "the norm that only states with comprehensive nonproliferation commitments should benefit from international nuclear cooperation." The NSG failed to halt "Iran, Iraq, North Korea, Pakistan, or South Africa from acquiring a nuclear weapons capability or sensitive nuclear technology," he points out, because of their clandestine activities in securing the requisite materials and weak national controls. In the future, McGoldrick argues, "to maintain the role of the NSG as an effective multilateral barrier to proliferation, its members need to press forward to reach agreement on requiring an additional [IAEA] protocol, to strengthen their own national export control systems, and to help non-members to implement effective export control systems" (Goodby 2006; McGoldrick 2011).

Perhaps it was these robust sentiments that contributed to India's failure to attain Nuclear Suppliers Group (NSG) membership in June 2016. Current NSG members remain intensely separated on whether India – or other states that have not signed and ratified the Nuclear Nonproliferation Treaty (NPT), including Pakistan – should be considered for membership. For many analysts, India's membership pursuit was unsuccessful because many NSG members were in simple terms not convinced that India embodies their views on nuclear nonproliferation. While the diplomatic drive from the likes of Modi and Obama, as well as ongoing bilateral consultations with China (the main objector), may make some

progress, it will only be tangible and definitive actions by India that will enable it to secure membership. For example, it could sign the Comprehensive Test Ban Treaty, end the production of weapons-grade nuclear fuel, and extend comprehensive safeguards to all civilian nuclear facilities. Some NSG members also argue that it is imperative that India ratify the Nuclear Nonproliferation Treaty as a nonnuclear weapon state before even being admitted to the NSG (Williams 2016). As stated by Laura Williams, "India faces an important choice. It can stay on its current path – focusing on politics rather than substantive policy concerns – knowing that this approach is unlikely to ease the current gridlock. Or it can address NSG members' concerns . . . and increase the odds of gaining membership. Unless and until Indian officials choose the second path, Delhi is unlikely to achieve the consensus it seeks – in 2016 or beyond" (Williams 2016).

## Nuclear Modernization and the Challenge to the NPT

Notwithstanding many of the abovementioned positives pertaining to the expansion and in many ways, emboldening of the NPT regime, concern with nuclear weapon proliferation and fear of their possible use continue deep into the twenty-first century. Recent substantial investments by nuclear weapon possessor states in the upkeep and modernization of their nuclear postures indicate a return of the nuclear factor in international politics – where deterrence is clearly taking precedence over nuclear arms control and disarmament and the ultimate global goal of nuclear abolition (Reif 2017). The nuclear reductions of Russia and the USA are slowing; US offers to resume bilateral arms control negotiations with Russia have been ignored; France reduced its arsenal by a third after 2008 but seems determined to retain its capability for the long-term; India and Pakistan continue to upgrade their delivery and weapon capabilities; and China is also adding to its arsenal and is believed to be deploying multiple warhead (MIRVed) missiles.

Aside from slowing down its nuclear stockpile reductions during its second term in office, the Obama administration embarked on an overhaul of its entire nuclear weapon enterprise, encompassing the development of new weapon delivery systems and modernizing its enduring nuclear warhead types and nuclear weapon production facilities in a program that scholars estimate could cost more than a trillion dollars (Wolfsthal et al. 2014; Reif 2017; Broad and Sanger 2014). The modernized B61–12 warhead, for example, will be able to strike targets more accurately with a smaller explosive yield and reduce the radioactive fallout from a nuclear attack and could thus become more militarily attractive and increase the likelihood of use. Other modifications under consideration, such as interoperable warheads that could be used on land- and sea-based ballistic missiles, "could significantly alter the structure of the nuclear warheads" and require nuclear test explosions and thus potentially introduce new uncertainties into the global nuclear order (Kristensen 2014). Simply put, work is under way to design new weapons to replace the current ones that will – of most concern – introduce new military capabilities to the weapon system.

While some analysts and writers from the think tank and media domains have expressed their concerns about modernization, there is a lack of substantive analyses. Most have correctly argued that without some form of defined limitations on the pace and scope of nuclear modernization, the goals of deep cuts in, and eventual elimination of nuclear weapons, will remain elusive as the continued reaffirmation of the value of nuclear weapons threatens to extend the nuclear era indefinitely (Kristensen 2014; Tanya Ogilvie-White 2013; Wolfsthal et al. 2014; Reif 2017). Others also contend more vigorously that what we are seeing today lies somewhere between parallel efforts to refurbish Cold War arsenals and the emergence of a new arms competition fueled by enhancements to existing weapons or production of new or significantly modified types (Kristensen 2016; Warren 2014). Much of the writing has focused on Washington's upgrading of the B61–4 bomb, a version that would equip the

device with a tail assembly, turning it into a precision-guided standoff weapon (Mecklin 2015; Kristensen 2016). The administration has merged four old B61 models into a single version (B61 Model 12) that greatly reduces the range of destructive power. It would have a "dial-a-yield" feature where the lowest setting would only be 2% as powerful as the bomb dropped on Hiroshima in 1945. Initially, the plan seemed plausible, until attention fell on the bomb's new tail section and steerable fins. The Federation of American Scientists (FAS) have argued that the high accuracy and low destructive settings mean that military commanders could press to use the bomb in an attack, knowing the radioactive fallout and collateral damage would be limited (Broad and Sanger 2016; Robinson-Avila 2014).

Proponents of modernization (and many within the US nuclear establishment) have argued that such changes are *merely* refurbishments/improvements rather than wholesale redesigns and, thereby, fulfill the president's pledge of not producing a new nuclear weapon (Malenic 2015; Kroenig 2015a, b). However, much of the recent literature has focused on the newer "agile" applications with concern. These analysts argue that while the explosive innards of the revitalized weapons may not be entirely new, given their smaller yields and better targeting the bombs might be seen as *more* conceivably usable in a limited or tactical conflict – even to use first, rather than in retaliation (Mecklin 2015; Broad and Sanger 2014). While official statements continue to justify nuclear modernization as simply extending the service life of existing capabilities, the "Pentagon now explicitly paints the nuclear modernization as a direct response to Russia" (Federation of American Scientists (FAS) 2016). As such, the US amplified modernization strategy scrambles the calculus of nuclear disarmament and nonproliferation efforts, challenging the aging underpinnings of the NPT itself (Mecklin 2015). As stated by Hans Kristensen, "Despite significant reductions in the overall number of nuclear weapons compared with the Cold War era, all of the world's nine nuclear-armed states are busy modernizing their remaining nuclear forces for the long haul. None of the nuclear-armed states appears to be planning to eliminate its nuclear weapons anytime soon. Instead, all speak of the continued importance of nuclear weapons... Perpetual nuclear modernization appears to undercut the promises made by the five NPT nuclear-weapon states" (Kristensen 2014).

## Conclusion

The amount of nuclear weapons on a global scale has decreased markedly since the end of the Cold War, down from a peak of approximately 70,300 in 1986 to an estimated 15,350 in late 2016. While this is clearly a positive, the second nuclear age encompasses a multiplicity of nuclear powers with interlinking connections of cooperation and conflict, delicate command-and-control systems, precarious cyber susceptibilities, threat perceptions occurring among three or more nuclear-armed states concurrently, asymmetric perceptions of the military and political utility of nuclear weapons, and, as a result, "a greater complexity of deterrence relations" (Thakur 2016). If a world without nuclear (in)security is at all attainable, it is precariously dependent on delicate conditions that require the presence of cogent decision makers behind each nuclear arsenal, as well as the "absence of any rogue launches, human-error incidents, or system malfunctions" (Thakur 2016). For nuclear stability to be assured, deterrence and fail-safe mechanisms must work every single time; for a nuclear devastation to take place, they only have to fail once. Clearly this is not a reassuring calculation, particularly as states evidently continue to attain nuclear weapons and, even more so, continue to busily modernize their stockpiles (Thakur 2016). It is with such scenarios in mind that a robust and enduring nonproliferation regime should be strengthened. However, the very present open-ended nuclear modernization drive is clearly at odds with the declarations made by the five NPT nuclear weapon states five decades ago. Here, they agreed to pursue negotiations in good faith on active measures to end the "nuclear arms race at an early date and to nuclear disarmament promises that have been reaffirmed

every five years at the NPT review conferences" (Kristensen and Norris 2014). It is unclear whether the global nuclear nonproliferation regime will survive the fractures that are opening up as a result of these developments. If nuclear force modernization programs continue apace without a renewed focus on arms control and disarmament, the future prospects of the NPT – which is almost universally acknowledged to be the cornerstone of the nuclear nonproliferation regime and one of the most important pillars of international security – look increasingly bleak.

## Definition

### Globalization

Globalization in this entry is conceived as described by Steger and Wahlrab (2017) as a range of both objective and subjective conditions and processes, moving toward increased globality. This chapter also assumes the newer understandings of globalization that recognize its unevenness. This means that not all political, social, or economic processes are moving toward a condition of increased globality at the same time. Some process or conditions may in fact become less global in the face of globalization (Ibid, p. 29). Nation-states, for example, remain very important actors although globalization may mean their roles change.

### Politics

This article takes as a starting point an "ethico-political" understanding of politics. Of particular relevance in this view is the understanding that politics are both related to contestation and cooperation, which are, in turn, implicated in both interests and ideals. Politics in this sense is about negotiating/making human futures as well as present conditions and is conceived of as present in a range of registers and not strictly in an overarching sovereign. Most importantly for this entry, the political is seen as tied up with alternate visions and struggles for the future that are increasingly enmeshed in complex global to local relations, processes, and conditions. (For an introduction to politics, see Alexander in press, this volume.)

### City

This paper recognizes that there is not an adequate or established theory of the city that describes what one is or how far one extends or applies across contexts (Aminy 2002; Amin and Thrift 2002 provide some much-cited groundwork for this perspective). Overall this view sees the city in a global context as unable to be defined as a type, or bounded in its reach and relations. This perspective is generally established in contemporary urban theory and sociology (see Harding and Blokland 2014; Parker 2015, pp. 227–228); however, there are some exceptions (so for a counterpoint, see Scott and Storper 2015).

## Introduction

Urbanization is said to be the hallmark of the contemporary era. The majority of people, as it is widely stated, now live in cities (UN 2014). Cities are variously seen to epitomize the peaks and troughs of development, house and provide playgrounds to the wealthiest elites, and, in their vast sprawls, contain the majority of humanity. More generally, the global future of humanity, as far as one can be described, is now widely understood and presented as an urban future. A future of cities and their successes and failures that is tied into global processes, social, economic, cultural, and environmental.

These processes are often, also, political and enmeshed in globalization. While cities are increasingly seen to create transnational networks and alliances, they also become islands differentiated from their regions in political as well as economic terms. Cities, and the processes that influence them, are broadly understood as now caught up in increasingly global flows of capital and culture that dislodge them, at least partially, from the politics of the nation-state. This presents new forms of territory and politics beyond and alongside the state, both in the sense of politics as contests of interest and in the more nuanced sense of politics as differing ideals of social organization, rule, and imagining, as defined above.

This is always, however, a manifestly partial account, because cities are not constant, or able to be bounded, or defined consistently, across time and space. From within, cities are lived and known in disparate ways. As such, statements and frameworks that describe cities in the above terms risk conflating vastly different contexts through the label of the city. These frameworks and understandings of the city in turn inform policy and governance and are increasingly global. Accordingly they wield great power in both influencing the direction of cities, through globally circulating policy approaches, and in defining what is counted as valid and desirable. As such the politics of describing cities must also be engaged.

The field of spatial approaches to cities, globalization, and their politics, while certainly established as of crucial relevance across a range of academic and practice domains, is not a discipline containing a discrete body of knowledge or theory. Indeed the hallmark of many spatial approaches is that they necessarily bring together interdisciplinary perspectives. As such, like the processes and contexts engaged, scholarship in this area is hotly debated and contested and is rapidly emerging. It is also extremely extensive. In order to address this topic adequately, yet within the scope of this chapter, the following text introduces a diverse set of recent work at this juncture and explains important current debates and scholarship at the nexus of cities, globalization, and politics. These contain

contestations and rarely lend themselves to singular discourses, overarching frameworks, or straightforward conclusions. However, as geographer Doreen Massey asserts, "an insistence on complexity leaves open more opportunities for politics" (2007, p. 11), and it is in this spirit that the following text introduces the topic.

## Section A: Important Trajectories and Debates

Many popular texts on the city justify their focus by starting with an outline of the importance of the urban as a rapidly expanding form. They do this through leaning on the much-cited statistic that this century, for the first time in history, more humans will be urban dwellers than ever before (Parker 2015, p. 227). They cite the economic power of cities and draw on a range of scholarship that positions cities as crucial nodes in the transformation of the world into a global economy. Reflecting this established focus, in Section A this paper firstly introduces the concepts of Global and World Cities. It then explains the need for a multifaceted understanding of their power as more than economic. Secondly, it introduces the importance of understanding the Global City concept as performative and imaginary. Thirdly, it introduces the idea of cities as politically enmeshed in global ethical and social spheres. The text moves in Section B to introduce a range of perspectives that problematize the usefulness of overarching frameworks to explain the spatial politics of cities and posit the adoption of critical, ethnographic, and comparative approaches. The text concludes with a discussion of some relevant theory related to the spatial turn more generally.

### Urbanization and Globalization

The first work that is important to understand is the work that utilized spatial approaches to understand the urban as produced in and productive of globalization in the form of economic expansions. Most urban theory introduces the shift to understanding the city as part of larger social relations using Manuel Castell's *The Urban Question* (1977) as a starting point. However, while this and other works that challenged earlier "ecological" approaches certainly set urban theory on the road to situating cities in broader social relations, it was arguably David Harvey's *The Condition of Postmodernity: An enquiry into the origins of social change* (1989) that for the first time linked this intrinsically to globalization. His work was influential both in globalization theory more generally (especially his coining of the Marx-inspired term "time-space compression") and in much work on cities and urbanization. Drawing on French philosopher Henri Lefebvre, Harvey articulated perhaps the first overt link between globalization and urbanization as related processes in the formation of capitalist expansion. Importantly Harvey's ongoing work insisted on the relevance of spatial thinking for approaches attempting to understand the production of injustice and exploitation in the contemporary era. These approaches became established in urban theory and urban sociology during the 1980s and 1990s.

### Global Cities, World Cities

In tandem with the high point in the early stages of globalization theory, there were also two related works that proved extremely influential in the scholarship around cities and globalization. These were Friedmann's (1986) *The World City Hypothesis* and Saskia Sassen's (1991) *Global Cities* (and her continuing work throughout the years thereafter). These both, aligning with aspects of Harvey's work, can be somewhat superficially explained as describing the Global City as a highly concentrated, strategic, and economic node in an increasingly global market economy. Sassen's recent description is informative:

> The Global City is not a bounded unit, but a complex location in a grid of cross-boundary processes. Further, this type of city is not simply one step in the ladder of the traditional hierarchy that puts cities above the neighbourhood and below the regional, national, and global. Rather, it is one of the spaces of the global, and it engages the global directly, often bypassing the national (Sassen 2016, p. 107).

It is well established that these trajectories cemented the "Global City" as an influential conceptual lens. The Global City concept has since remained highly influential albeit undergoing

many transformations and refigurations since its inception in the 1980s (see Brenner and Keil 2006). While this work presents a range of competing explanatory frameworks and theories, much has (a) characterized globalization as largely an economic process associated with the spread of free market capitalism, the lowering of trade barriers, and the regulation, to facilitate economic growth, and (b) of cities, or more specifically some cities, as crucial nodes or sites of power and concentration within these global capitalisms. The key premise of this theorizing of the city remains important when thinking through the politics of cities, as it situates some cities, and certain aspects of some cities, as a fundamental part of globalization. However, some of these lenses have also been problematized as, firstly, too partial because they strongly emphasize the sphere of the market at the expense of other spheres. Secondly, they have been problematized as attempting to provide explanatory frameworks too encompassing to rigorously engage the actual complexities of city life and in so doing to silence other accounts.

## Global City Imaginaries and Identities

The *idea*, or *imaginary*, of the Global City has also been shown to have great power and influence. It has had a role in shaping regional and national policies, planning regimes, and fostering massive spatial and strategic changes in cities worldwide. The cities, as described above, where the processes and resources of the global economy are seen to agglomerate and concentrate most are labeled World Cities or Global Cities. They are also often seen as exemplars of modernization and development. As such they are, in narratives of development and modernization, often promoted as *ideal* cities. In this way the World or Global City concept must also be understood as a *performative* concept with concrete material, social, and cultural effects. A range of scholars since the late 1990s have noted the promotion of the World City as instrumental in the building of national, regional, local, and individual identities (see Yeoh 2005 for an excellent introduction to a range of this literature; see also Brenner and Keil 2006). Importantly for this chapter, a number of scholars have shown that the aspiration of becoming a Global City has led to massive slum clearances, the building of information corridors and tech highways, and the construction of cultural precincts and iconic buildings. This local, national, global identity is complex politically, because, for example, it introduces a realm of cultural contestation raising questions about what happens when the imaginary of the Global City contrasts the politics or policies of the national or regional.

## Cosmopolitan Alliances and Networks

One aspect of this is the various movements to link cities into globalized ideals and networks of morality and ethics. These are often in the form of international human rights regimes and international standards of environmental and social protections. Beyond being aspirational these can increasingly be seen to shape concrete aspects of rule within and between cities. There are, for example, a range of city alliances that voluntarily bind cities both to each other and to globally aspirational agreements, ratifying and meeting targets that play out as law and regulation within these cities. These range from immigration and diversity issues, as in the networks of Sanctuary Cities in the USA and Europe, which can also be seen as more deeply political than solely providing sanctuary to immigrants, and are sometimes presented as embodying a new political ethos, remaking political membership/citizenship (see Ridgley 2008). To environmental regulations with planetary scale intentions such as on issues of climate change, for example, the C40 network (see Fraundorfer 2017 for an excellent overview). These alliances unite cities across National jurisdictions, often as economic or cultural powerhouses and/or conglomerations. Importantly they demonstrate global scale visions and intentions that contrast or contend national ones (Fraundorfer 2017, p. 23). Some cities are seen to ratify international laws, even when the states they reside in do not. This complication of territorial arrangements raises questions regarding sovereignty, citizenship, and security and as such is deeply political (see Benhabib 2008 for an extended account of the conditions and political implications of these changes).

### The State and Populism

The politics of these alliances are often discussed in terms of global citizenship and cosmopolitanism and are contrasted, culturally, with the nation-state (Benhabib 2008). However, it is important not to downplay the role of the state in the spatial politics of cities. Wacquant (2008, 2009) has demonstrated that instances of extreme urban marginalization, segregation, and exclusion, in both the USA and France, are closely entwined with, and produced by, the changing role of the state in the context of neoliberal globalization. In these texts Wacquant shows that as the welfare state is "rolled back," a penal one is "rolled out" and as the poor are punished, the areas they live in demonized. This then is an instance of state politics producing a spatial politics in the city. In the same vein, it is also worth noting recent returns to political/cultural nationalism, because the above-described alliances and agreements situate cities as politically contesting the power and logic of the state. Representatively, a vote after Brexit by Londoners to remain in the EU and leave Britain termed the "Londependence" petition raised 170,000 signatures (82,000 in 1 day) in the weeks after the Brexit vote (Oliver 2016). In the USA, sanctuary cities have vowed to defy federal policy, notwithstanding the threat of federal funding cuts (Robbins 2017). At the time of writing, it remains an ongoing question to what extent, and in what arenas, networks of regulatory, economic, and cultural power, in the form of city alliances/networks, wield sufficient political influence to resist national agendas. The context of populism highlights the politics of where city contrasts state. As such the resurgence of populist sentiment presents forthcoming questions about the power and influence of the city in the context of globalization as well as about the reach of the state into cities.

### Hospitality and Social Justice

The tensions described above have significant consequences for spatial politics inside cities. Raised questions are as follows: Are certain bodies or lives welcome to take up space? How is a right to a place in the city, a home, or a neighborhood ensured? Is there an intergenerational right to a place in the city? Who participates in the city? These questions are taken up both in academic discussions of hospitality and forgiveness, for example, the city conceived as "*Villefranche*," where *hospitality and ethics* and *ethics and politics* are intrinsically linked or at times substitutable (Derrida 2001), and in the "Just cities" movements and the push for a human right to housing. These latter are often cited as drawing on the "right to the city" discourse of Henri Lefebvre (see Purcell 2003 for an in-depth discussion of this) and also engaged by Harvey (2015). They center on "a politics in which inhabitants (instead of capital and state) take a central role in the decisions that produce the space where they live" (Purcell 2003, p. 583). However, it is worth noting that both of the above, while often described in the language of these French and American social theorists, are also situated in much more diverse movements and grassroots campaigns.

### Who's Cosmopolitan City?

A related aspect of the politics of these ostensibly cosmopolitan agendas is that in these Global, World, or Mega cities, the particular narrative of globality, and the type of globalization promoted, may also be one tied up with global inequalities and exploitation. Massey (2007) explains that the foregrounding of London's ethos of hospitality and diversity, by the Mayor and the media in the wake of the 2005 terror attacks, is a foregrounding of just one aspect of London's role as a World City. Massey points out how among those who migrate, there are many who do so because their "livelihoods have disappeared in the maelstrom of neoliberal globalisation" (p. 8) and that London and other global cities are the seat of power of many of the processes that have caused such migrations (Ibid, p. 11). From a largely economic development-grounded perspective scholars, Florida (2005), who coined the well-known term "spiky world," have demonstrated how some cities thrive and become highly connected, while the regions around them do not. In this analysis these cities can be seen as spikes of wealth, technology, and development, while other regions languish in troughs of poverty and underdevelopment. This aligns with increasing unevenness and inequality in economic globalization more generally.

Others such as Saskia Sassen (2014) have provided more nuanced interrogations of unevenness. Demonstrating, for example, that this unevenness extends into and through cities, Sassen goes further to argue that the exclusions and marginalizations played out in and around the Global City are in fact intrinsic to the processes of the Global City. They are, she argues, essential to the maintenance of various predatory formations of global finance capitalism. Sassen insists that new transborder formations of power can be seen as, alongside the state, becoming crucial to governance and rule. These are fundamentally market-related assemblages that are able to take advantage of new deregulation and privatization conditions that are increasingly global in spread. This expansion of governance into these spaces is something that Sassen argues is crucial in understanding the spatial politics of the city. Furthermore, Sassen argues that it is only in the city that there is the complexity to resist such process, aligning with Lefebvre (1996) and Harvey (2010) to posit that the urban holds the potential to produce change. However, she also suggests that urbanization in the form of privatization and unfettered development is stripping the urban out of the city, creating spaces that are undemocratic and hold little potential for resistance or struggle (Sassen 2014).

### The Complexity of Exclusions, Inequalities, and Expulsions

Sassen's work, aligning with a broad swathe of urban theory since Castells (1977) and especially Harvey (1989), is presenting a politics that is often intrinsically tied to economic and material processes. Much of this work can appear in one sense apolitical or neutral in its frameworks. As, in its Marxist roots, it presents the analysis of social relations (in this case urbanization and globalization) as material, factual, and analytical. The political is in one sense seen as the class struggles within this, albeit in new forms. However, the question of who is left out is deeply complicated by spatial understandings of urban conditions and globalization processes. The question of who is excluded can, for example, refer to categories of people dispersed throughout landscapes or grouped into segregated areas. It can refer to entire regions, and these may range in scale from the local to the global. Increasingly in the context of the global economy, it is seen that extreme inequalities, linked into global processes, are situated side by side in the city. Perhaps more importantly, in these conditions, the crucial question arises about left out of what?

When emancipatory or political processes are seen as about resource distribution, then questions are often framed as redistributive and about labor and resource allocation. But if they are about inclusion in the making of, imagining, and ruling of the city, then they require attention to different aspects of politics, such as participation in the social and political spheres of city life. This necessitates a focus on where power and the political are located and what moral and social purposes they are mobilized for. This concern has been echoed in recent urban theory conversations that ask "where is politics" (Rodgers et al. 2014 provides an excellent introduction to this). A concern with exclusion, or inequality, requires an engagement with both material and economic processes, as well as cultural and ideological ones. The second section of this text will introduce some recent trajectories of research and thought that engage this further.

## Section B: Situating the Spatial Politics of Cities

In his recent work on Mumbai slum clearances, Asher Ghertner (2015) shows that it is impossible to situate the planning choices of city makers in Mumbai outside of semi-shared visions and aesthetics of the World-Class city. Mapping the trajectories of land governance, planning, and clearance in Mumbai since the late 1990s, Ghertner demonstrates that above all it is the image of the city as a "globally competitive, aesthetically appealing metropolis" (p. 184) that has driven and enabled extensive change. He situates this as "rule by aesthetics" (ibid), highlighting the political aspect of shared imaginaries and visions of the city and showing that they have overridden and overruled, in the case of Mumbai, the city's

more established avenues of political influence such as planning schemes and regulatory regimes (ibid). Spatial politics in this case, as discussed in the section above, are therefore tied closely into visions and hopes for the future city.

Ghertner's research however also highlights that these visions hold out differing promises and reflect different hopes depending on who is imagining them. Showing how the World-Class or Global city is imagined is subjective and situated. This situated research (along with other similar studies) suggests that there is extensive agency in the movements of the poor. Ghertner explains that while widespread displacements were, in the slum clearance high point of the early 2000s, premised on the vision of the World Class, so too are new hopes and struggles for inclusivity and ownership of the city (pp. 197–198). He demonstrates the ways in which the urban poor of Mumbai refuse to give up the promise of the World-Class city that includes them, stating that "the urban poor's experimentations with dominant ways of seeing and saying suggest that they are prepared politically to force inclusion." Likewise in her recent study of Madrid's squatter and housing rights movement, Gonick (2016) argues that "we are witnessing an anticipatory politics that fundamentally challenges hegemonic relationships between everyday citizens and regimes of property ownership" (p. 833). Aligning with work that will be discussed below, her thesis argues that state-based explanations of power and coercion, and the broad explanatory frameworks of many social theorists, potentially silence the actual politics of the everyday and the agency of the poor (Gonick 2015, p. 9).

Ananya Roy's work in Mumbai has also engaged the politics of slum clearances and the lives of the global urban poor (Roy's work aligns with and is often drawn on in the abovementioned work). Her work also shows how slum dwellers' resistance and agitation for a place in the city is tied into South-South networks such as the slum dwellers federation. These solidarities stretch from Cape Town to Mumbai to Detroit and draw on both local and increasingly global understandings of justice, innovation, and resistance. These sorts of global solidarities (which are deeply political in their implications because they challenge the status quo and agitate for change) tie into broader social movements and transnational solidarities in the context of globalization. However, importantly, Roy's work asserts an emphasis on learning from these struggles and emphasizes that a critical attention to poverty is important in approaching the politics of capitalisms, stating in a recently edited book that just as "we must rethink capitalism and its futures, so we must rethink the established geographies and vocabularies of resistance" (Roy and Crane 2015, p. 25). This sets apart the work of theorists, researchers, and scholars such as Roy, who often take ethnographic and comparative approaches, from the much of the work covered in Section A above. Attending specifically to the everyday practices of becoming global in cities of the majority world, Roy and Ong (2011) describe these practices as forms of Worlding. Contrasted with earlier conceptualizations of Worlding practices as colonization and imperialism, they instead "focus on the urban as a milieu that is in constant formation . . . inherently unstable, inevitably subject to intense contestation, and always incomplete, Worlding is the art of being global" (Ibid, p. xv). Becoming global (subjective globalization) in the city is then, in this account, experimental.

The above discussions align with, and at times draw upon, broader discussions of the politics of subjectivity and citizenship in the context of globalization. Spivak (2000), Butler and Athanasiou (2013), and Brown (2000) have all engaged the conundrums of how those struggling for representation and recognition take up and negotiate liberal democratic notions of political sovereignty and individualism, in the context of long-standing colonial and imperial regimes of power. Such conversations emphasize the role/emergence of new forms of cosmopolitanism that stretch the political out to global or transnational scales, yet cannot easily be explained through explanations of the political based in the cannons of Western Liberalism or political theory. They emphasize the need to "provincialize Europe" (Chakrabarty 2000; Roy 2009; Robinson 2006, 2011), which in a simplified way means to see and position the (often) dominant Western or European cannon,

and frames of analysis (such as modernization and development) as just one among many. They decenter or dethrone them. They also emphasize the need to pay attention to the ways that new forms of the political, seen in the struggles of those presented as marginal and disadvantaged (who often in fact make up most urban dwellers in the world), both take up and at the same time subvert these traditions.

In understanding the spatial politics of cities, the underpinnings of the approaches presented in this section have led to strong calls in urban theory for comparative and situated inquiry into what Jenny Robinson has coined "Ordinary Cities" (2006, 2011), emphasizing the need to study cities that might not conform to the analytical and knowledge frames of urban theory or sociology but that in fact make up the majority world. These approaches are founded in a deep skepticism about the usefulness and the analytical rigor of approaches that attempt to construct meta-narratives or explanatory frameworks of analysis that can be deployed across contexts. The call to pay attention to Ordinary Cities challenges many of the urbanization thesis of the past, including many of the Global City approaches. In one sense the call for attention to the power of explanatory frameworks politicizes the *theory* of the city.

## Political Implications of the Spatial Turn

Globalization brings extreme challenges to thinking through and theorizing politics. No longer do the frames of nation-states and established, formal systems of rule bound the inquiry (if indeed they ever usefully did). Traditional political science registers that locate concentrations of power in agents and actors, in sovereign powers of various kinds, are challenged by conditions that illuminate, and perspectives that forefront, difference and contextuality. From the more traditional political perspectives, urban politics can be situated in three registers, those that situate power in the state, those that situate it in markets or economic relations, and those that situate it in citizens or subjects or (as is more usual) those that see it as situated in a combination of these, but approach it as a contestation or conflict between them (see Magnusson 2013). However, the politics of cities according to spatial approaches demands more than this.

The student or practitioner of public administration, interested in the politics of cities, must learn as a starting point that the "urban" often aligns with the lean in the humanities and social sciences to what has been known as the spatial turn. This can be briefly explained as the move to an inclusion of the philosophy of the *spatial* rather than or alongside the *historical* (or as it is often termed *temporal*) (Soja 1989). One of the key aspects of the spatial turn was to see space as produced in social relations, rather than neutral, or given. As such the city was now seen as produced by a range of processes, structures, or relations that are social. It is *social space* (De Certeau 1984; Lefebvre 1991). Furthermore, however, the spatial is not just seen as produced by social relations but is also implicated in the production of social relations. This shift, when employed in understanding political and social processes, is thought by many to provide deep challenges to modernist and technocratic perspectives that are grounded in theories of progress and history. At least in part, this is because an attention to space, to context, reveals a multiplicity of simultaneous conditions.

A multiplicity of spaces illuminates the differences between different spaces, from the personal space of bodies to the intercontinental spaces of geopolitics, and global capitalism. In the 2005 text *For Space*, Doreen Massey points out that difference sheds light on inequality and also on struggle, in turn making (social) space obviously political. She asserts that the political implication of this multiplicity is that there is more than one future. There are instead futures. This breaks significantly with linear narratives of development and progress, because no longer is a city, a suburb, a group, or an individual situated at or moving through some point on a trajectory from one state or condition to another, for example, from developing to developed, from industrial city to cyber city, or from manufacturing to service industry. This in turn interrupts the often utopian, aspirational, condition of being developed/modern.

It highlights the construction of this vision as a narrative, rather than a truth (Soja 1989). This multiplicity of simultaneously existing conditions that are different also brings serious challenges to the project of creating describing frameworks of meta-narratives that explain what is happening in cities and how to manage them.

In urban studies some go so far as to suggest that it is the practices and processes of the urban that are politics (see Magnusson 2013); that politics, democracy, and citizenship are best articulated and understood through the negotiations, struggles, and compromises of the everyday life of the city; and that in the making of life in the city, we can reorient inquiry into the political to a more productive emphasis than traditional political science registers. So while some spatial approaches to urbanization have on the one hand bought to light the politics of complex actor network relations and processes of agglomeration and financialization, there are also spatial approaches that conceive of the political as deeply embedded throughout the practices of cities. In these approaches the praxis of public administration, for example, becomes political as it strives to implement policy. The struggles of squatters and the strategies of elites (whether resisting displacement or fostering gentrification) are part of the spatial politics of the city.

## Conclusion

This text has introduced the beginning reader to a range of work that complicates traditional perspectives on the spatial politics of cities. It can be seen that while most current thinking on urbanization and cities engages theory ostensibly of the "spatial turn" in some form, these approaches have been taken up and deployed in different ways. Most importantly there have been tensions and ongoing debates between those that seek to describe or explain the social production of cities (using spatial approaches) to construct wide reaching analytical frameworks such as Global Cities and those that insist that a spatial approach in fact renders such "grand narratives" incoherent and problematic in the face of globalization. Instead of asking where urban politics is enacted. Embodying these approaches Gonick (2016) asserts that:

> politics 'happens' in locations often left off the map of both scholarship and popular imaginaries, and, crucially . . . [these] locations can, in fact, illuminate shifting political arrangements elided by other methodologies. (p. 833.)

As such of particular relevance in understanding the political aspects of social space and cities is a range of recent work that eschews so-called meta-narratives or explanatory theories of the city yet does not forgo politics, instead combining empirical and theoretical work on cities with an overt and intrinsic attention to politics as praxis.

# Globalization and US Education Policy

Neena Banerjee
Department of Political Science, Valdosta State University, Valdosta, GA, USA

## Synonyms

Inequality; Privatization; Public schools; School choice; Technology

## Introduction

The United Nations in its Universal Declaration on Human Rights proclaims education as a fundamental human right, calling on member nations to provide their peoples not only compulsory and free elementary education but also an equal opportunity to access technical, professional, and higher education opportunities on the basis of merit. The Declaration further stipulates that education should promote understanding, tolerance, and friendship among all nations and racial or religious groups and that parents should have the right to educational choices for their children (UDHR, Article 26). As nations around the world struggle to reform their national education systems to meet the goals articulated in Article 26, there is a widespread disagreement regarding strategies and actions that are needed. The challenges faced by nation-states in their quest to educate the masses have been complicated by the potent force of globalization. Globalization has fueled the spread of basic education universally by transforming schooling into a global cultural norm and by simultaneously placing education into the national and global agendas (Chirico 2014; Torres 2002). It has pushed societies to rethink the purposes of education in an increasingly interdependent world where welfare of nations are tied to each other by economics, the environment, politics, culture, information, and technology (Merriman and Nicoletti 2008).

The USA has been one of the driving forces behind globalization due to its technological and scientific leadership. However, there are concerns if the country will be able to sustain its leadership in the twenty-first century given the myriad challenges that the public education system is facing. There is a growing dissatisfaction over the quality of learning in the US schools in terms of both low graduation rates and the consistent poor performance of students in reading, mathematics, and science as compared with their international peers. The 2012 results from the Program for International Student Assessment (PISA) that is administered to 15-year-olds in 65 countries show that students in the United States ranked 17th in Reading, 20th in Science and 27th in Mathematics among Organization for Economic Cooperation and Development (OECD) countries (see www.oecd.org unitedstates/ for more on this). Socioeconomic disparities in student achievement and the inequities in the quality of schools persist despite successive reform efforts that have been implemented over the past several decades. While there is a consensus that public schools in the USA need reform, the content and mechanism of reforms are widely contested (Ravitch 2010).

## Globalization

The term globalization is difficult to define as it draws diverse interpretations. These diverse interpretations of globalization range from political, social, economic, technological, and cultural transformations that have blurred national boundaries and intensified international interactions (Rizvi and Lingard 2013). Globalization, through the lens of politics, is a process that brought "uniformity of political ideas and practices" such as a preference toward neoliberal policies that value markets over the state (Rizvi and Lingard 2013, p. 421). From a societal perspective, globalization takes the meaning of "increasing interconnectedness between societies such that events in one part of the world more and more have effects on peoples and societies far away (Baylis and Smith 2001, p. 7)." From an economic perspective, globalization is referred to as the product of the emergence of a global economy that is managed through multinational institutions such as the International Monetary Fund (IMF) and the World Bank (Torres 2002). On the technology side, globalization is synonymous with intensification of transnational communications and the diffusion of technology that has resulted in a world that is flat, without borders, with instant communication, and with open financial markets (Merriman and Nicoletti 2008, p. 8; Friedman 2005). From a cultural standpoint, globalization refers to the dissemination of cultural symbols and significations through the seamless flow of the Internet and various other forms of mass media

(Marginson 1999; Clark 1997). Lastly, globalization is distinct from internationalization. While the latter presumes nations as the essential unit, the former refers to the formation of world systems without negating the nation-state (Marginson 1999; Taylor et al. 1997, p. 56). Although different countries have experienced such restructuring of the nation-state in different forms, some common ideological features have emerged. These include a commitment toward market-based services, a leaner role for the state, and a renewed focus on the individual consumer and the choices they make (Henry 1999; Taylor et al. 1997).

## Globalization and Schooling in America

### Globalization and the Changing Purposes of a School Education in the USA

Public education in the USA has always served as an important site of struggle for civic assimilation and socioeconomic equalization (Ravitch and Viteritti 2001). During the late nineteenth century, the common schools fostered civic values and contributed to democratic nation building through civic assimilation of immigrants. During the second half of the twentieth century, public schools were at the forefront of efforts in eliminating racial segregation in schools and democratizing educational access. By the 1950s, the country achieved highest literacy rate with greater opportunities for higher education for its citizens. All this helped create a vast pool of human capital for sustaining economic productivity at an unprecedented level (Hill et al. 1997). By the end of the twentieth century, however, public schools started to falter on their commitment to civic assimilation. Many believe that the forces of globalization have altered the purposes of education and the role public schools play in upholding them.

While globalization has intensified large-scale human migration to the USA, it has also led to greater economic and social polarization within the country and complicated social identities (Henry 1999). This phenomenon has stimulated public debate on how the nation's public schools should tackle pluralism in its curriculum and pedagogy (Sutton 2005). The decades of 1980s and 1990s saw public schools gradually embracing diversity and multiculturalism at the cost of its foundational principle of blending a diverse population into a common citizenry through civic assimilation Ravitch and Viteritti (2001). This shift is a key reason for devaluation of civics in school curriculum and a decline in the basic understanding of government and the US Constitution among young Americans in the decades that followed. For example, the National Assessment of Educational Progress (NAEP) Civics Assessment scores have remained stagnant for the past two decades with the most recent scores collected in 2014 showing that only 23% of America's eighth-graders are "proficient" in their civic learning. Furthermore, the results continue to indicate ethno-racial and gender inequality in civic education outcomes (National Center for Education Statistics 2015). The opponents of multiculturalism believe that globalization has led to a divided culture in America. It has diminished "the prospect of a society in which the once-common school of a common civil society is no longer so common, and is in measure replaced by different schools selected by parents who hold different values and different orientations on schooling and society (Glazer 2001, p. 168)."

Globalization has also led to commodification of education to the detriment of other broader purposes of education (Henry 1999). Public schools across the USA are increasingly focusing on economic and vocational goals that would create skilled workers ready to compete in the global economy of the twenty-first century. This has led to increasing standardization and narrowing of the curriculum in many high schools with emphasis being given to language, science, and mathematics and neglect shown toward arts, civics, environment, and health education. This narrowing of the curriculum through standardized testing has also led to higher inequity in learning outcomes among students. Dropout rates and student disengagement have also increased for many students who feel a fundamental disconnect between what they are learning in schools and the world around them (Reimer 2006).

## Globalization and the Growing Inequity in Educational Access and Outcomes

Historically, Americans have perceived education to be a great equalizer that helps even the most disadvantaged students overcome seemingly impossible obstacles (Manna 2011). It is one of the reasons why education is considered integral to achieving the American Dream. Concerns about equity in educational opportunities, however, have been a consistent force since the 1960s. These concerns have led to federal policy interventions in education which has traditionally been the domain of the state and local school districts (Manna 2011). While the country has made impressive strides in many aspects of education such as abolishing segregated schooling by law, overall improvement in achievement levels for all groups, decline in dropout rates, and greater equity in resource allocation, the progress has remained slow. According to the US Department of Education, about 70% of White students attend schools that are at least 75% White, and over 50% of Black children attend schools that are predominantly minority. Moreover, in large urban neighborhoods, about 90% of Black children attend schools that are primarily non-White (US Department of Education 2004; Orfield and Yun 1999). These findings clearly indicate the existence of segregated educational opportunity in the country. The data further reveals that in inner cities, 61% of Black students attend school where over 75% of students are eligible for free and reduced lunch, an indicator of their low socioeconomic status. While the opportunity gap remains in spite of targeted efforts, the picture is even more discouraging for educational outcomes.

There are significant racial and socioeconomic differences in educational outcomes. Recent studies show that as early as when children enter kindergarten, there are already significant achievement gaps as a result of their socioeconomic status (Garcia 2015). According to the 2000 National Assessment of Educational Progress (NAEP) statistics, by the end of Grade 4, Black kids are almost 2 years behind their White peers (Cooley 2009). The high school completion rates are 90.1% for Whites, 81.5% for Blacks, and 58.5% for Hispanic students. There is scholarly unanimity that socioeconomic status is the single largest predictor of children's school readiness and achievement trajectories over time.

Globalization has played its role in part in these educational inequities in the USA by exacerbating poverty, unemployment, and income disparities (Marginson 1999). Lowering of minimum wages, unemployment particularly in manufacturing, dismantling of safety nets, and poverty are some of the detrimental effects of globalization that the US economy has experienced. Given the country's history with race relations, such socioeconomic polarization has impacted racial minorities adversely. The geographic segregation of families by race and income has multiplied the effects of family resources on children's educational outcomes (Farkas 2003). Data from the US Department of Education shows that around 17.3% of households with children under the age of 18 years lived below poverty level in the year 2004. The persistence of poverty among some racial groups and the concentration of these groups in particular neighborhoods have affected the academic performance of children who belong to such neighborhoods.

The neighborhoods where Black and White kids live are fundamentally different from each other due to residential segregation. Per 2002 US Census report, Blacks are still the most residentially segregated among all ethno-racial groups. Low-income Black families are largely concentrated in low-income neighborhoods in central cities across the country. The concentration of poverty and crime in these neighborhoods along with the lack of basic amenities such as good schools, day-care centers, public libraries, recreational facilities, and social service providers have all contributed to create an adverse impact on the academic success of Black adolescents. In addition to this, the degree of social interaction and cohesion among families in such neighborhoods is rather limited. This is due to very high residential turnover rates, lack of ethnic homogeneity,

and the presence of large number of immigrant population in these neighborhoods. The absence of a positive neighborhood environment has resulted in fewer social controls over children and fewer role models for children to follow. As a result, children from these neighborhoods are less likely to do well in school and are more likely to engage in crime, dropout of schools, and remain unemployed (Pebley and Sastry 2008). Such disparities need to be eliminated because they have enormous implications, both generational and intergenerational (Levin 1999).

## Globalization and Privatization of School Education

Globalization has also led to greater commitment to market-based provision of services and a greater focus on individualized consumerist ethos (Henry 1999, p. 88). In the context of school education, such a shift has manifested through a restructuring of educational governance from a bureaucratic activity to more as a market with greater focus on parental choice. Although private schools and other forms of private instruction existed in the USA prior to public schools, the past few decades have witnessed a growing debate over the usefulness of a government-provided public school system in this country (Belfield and Levin 2005). This debate over educational privatization is also known as the school choice movement.

Milton Friedman in his 1955 classic essay titled *The Role of Government in Education* made a case for school choice through voucher programs. He questioned the role of government in the provisioning of education and called on the government to restrict itself to funding education through vouchers and ensure minimum regulations so that schools are aligned to the social goals of education. The school choice movement, however, got a boost many years later in the early 1990s when John E. Chubb and Terry M. Moe published their book *Politics, Markets, and America's Schools*. Chubb and Moe (1990) called for institutional reform by applying the choice mechanism that, according to them, would bring a new institutional framework within the public school system without necessarily privatizing public schools (Chubb and Moe 1990, p. 225).

School choice since then has largely taken the form of voucher schools, privately managed schools, and charter schools. Proponents of school choice argue that competition would increase efficiency by restructuring incentives both within and across schools. Since schools would have to compete in order to attract students and survive in a competitive marketplace, each school will try to operate at a lower cost and become more efficient in the process. Moreover, competition would enhance individual liberty by allowing parents the option to choose an education for their children that matches best with their own values. Furthermore, the matching of consumers (parents and students) and suppliers (schools and districts) would lead to better student achievement. School choice advocates also believe that choice would advance equity by leveling the playing field for poor minority students through open enrollment. If choice programs are properly designed, it would offer a way out for students from failing public schools, particularly minority students from intercity schools (Belfield and Levin 2005).

Opponents believe that school choice would benefit children from wealthy families disproportionately because their parents have the information advantage, and they can make the most use of it through their social networks, unlike parents with limited resources and education who may find it difficult to exercise choice in a timely and appropriate fashion. It could also lead to resegregation as families tend to prefer schools that have students from their own race and socioeconomic background. A massive outflow of students from poorly functioning schools due to choice would eventually close down many schools on account of higher fixed costs. Limitations in terms of alternatives could seriously undermine the choice program as will be the denial of admission (Belfield and Levin 2005).

The evidence of school choice on educational outcomes however has been mixed. For example,

a review of more than 40 studies conducted between 1972 and 2002 to examine the effects of interdistrict, intradistrict, as well as competition between public and private schools shows a modest but positive relationship between increased competition and improvement in test scores, no effect on dropout rates, and a positive effect on public school graduation rates. The effect of competition on spending is inconclusive. Studies on the impact of charter schools have found that these schools are less likely to enroll the neediest students than regular public schools, and they do not perform any better than traditional public schools (Ravitch 2010; Belfield and Levin 2005).

### Globalization and Technology Needs in Schools

Globalization has prompted concerns about digital divides in American schools. Access to latest technologies and information is seen as a powerful tool for students to fully reap the benefits of globalization through education. Unequal access to technology, both at school and at home, can exacerbate the already existing ethno-racial and socioeconomic gaps in academic achievement in schools and future life trajectories of young Americans by preparing them differently for the global labor market (Warschauer et al. 2004).

In the USA, computer and Internet access is distributed unequally by race, income, and education (US National Telecommunications and Information Administration 2002). Available data indicates that both use of and access to technology are important. For example, home computer access raises the academic achievement of high-SES students more than it does for low-SES students. Furthermore, high-SES students with home computers are much more likely to use them to complete school assignments than are low-SES students with home computers (Becker 2000; Attewell and Battle 1999). Inequalities also exist with regard to quantity and quality of computer equipment in schools although these gaps are gradually being narrowed. For example, compared to 1998 when the ratio of students to instructional computers with Internet access in US schools was 17.2 in high minority schools, in 2001 that ratio declined to an average 6.4 students per computer in similar schools. The ratio declined from 10.1 in 1998 to 4.7 students per computer in low-minority schools. The gap between low- and high-minority schools has declined in other areas such as students per computer, students per multimedia computer, students per networked computer, schools with high-speed Internet access, schools where the majority of teachers are using the Internet, and schools with laptop computer programs (Warschauer et al. 2004, p. 564; Kleiner and Farris 2002).

Research has documented the variation in computer use by socioeconomic groups and within-school practices that reinforce such inequality in schools. In many schools, only the advanced students enjoy the privilege of internet use. Furthermore, studies have found that while high-SES or White and Asian students use computers in schools for research intensive activities in the science subjects, low-SES or Black and Hispanic students are more likely to use computers for remedial or vocational courses (Warschauer et al. 2004, p. 564; Becker 2000) Overall, technology usage in schools has not mitigated the existing inequalities in school and society.

## Conclusion

In conclusion, globalization has impacted the socioeconomic and political landscape of the USA. Expectedly, it has also affected several aspects of its school education, including its purpose and inherent inequities in access, outcomes, resources, and privatization. While some of it may be positive, there are also areas of concern. There is evidence that globalization has exacerbated the socioeconomic and ethno-racial gaps in educational opportunity and learning outcome in the USA in direct and indirect ways. However, more documentation is needed to flesh out the extent of globalization's impact among several other forces that have shaped the educational opportunity structure in the USA. It is also important to document the new forms of inequalities that are emerging due to increased role from market and

technological forces in education provision. More studies would need to document educational programs, policies, and approaches that are useful in the global context.

# Globalization and Violence

Arnaud Blin
French Institute for Strategic Analysis, Paris, France

## Introduction

A century ago, at the outset of the conflict which is known to us as World War I, the English philosopher Norman Angell published one of the most influential political texts of the twentieth century, *The Great Illusion* ((Angell 1911) the title would subsequently be borrowed by the great movie director, Jean Renoir, for his cinematic masterpiece of the interwar years (1937) bearing that same name). *The Great Illusion* sought to analyze the impact of economic interdependence on war, Angell arguing that logically, should statesmen and the people who elect keep their wits about them, global interdependence, or, as we refer to it today, globalization, should alter the nature of international relations to the point of putting an end to wars. Of course, history was to quickly inflict a crushing blow to Angell's optimistic vision of the future, though it did not invalidate the core of his analysis. In effect, Sir Norman Angell had not predicted the end of war but forcefully suggested that, in a rational political environment, such should be the outcome of globalization that statesmen would understand that armed conflicts would be detrimental to the national interest of the countries they were entrusted to lead.

## The Changing Nature of Globalization and Conflict

International relations, however, are not all about rational actors. Miscalculations, brewing resentments, hubris, and miscommunication all play a role which, at times, can mean the difference between the peaceful resolution of a conflict and a global war. The multiple causes of World War I all point to a conflict which, rationally speaking, should have been avoided but that no one was able to prevent. The globalization of the nineteenth century had taken the form of a competitive struggle between a handful of industrially advanced European states that sought to exploit the economic riches that came about with globalization to enhance their power and influence. At the same time, it left those that did not join the bandwagon to be either crushed or sucked into a position of dependence vis-à-vis more powerful nations. Practically speaking, this situation caused the crumbling of old empires such as Austria, Russia, or the Ottoman Empire that, ultimately, played a significant part in igniting conflicts small (the Balkanic Wars) and great (World War I), as well as destructive revolutions, such as Russia's.

Still the effect of globalization on war and peace is conditioned by the environment in which it occurs. The late nineteenth century was a volatile period of great upheavals that saw the restored Westphalian order of 1815 prove vastly inadequate in a geopolitical environment dominated by nationalism and competing political ideologies. Or course, most observers at the end of the nineteenth century would have been in accord with Norman Angell's vision of "globalization" as a force for peace. Notwithstanding the strength of the idea of progress that dominated, indeed pervaded, the times, many of the conflicts of the day would have been interpreted as vectors for progress and, ultimately, for lasting peace. Such was the idea behind colonialism, and while London always saw the process of subjugating foreign subjects primarily as an economic one based on the circulation of goods – a basic tenet of globalization – that served the national interest of Great Britain, Paris did see its colonial wars as an instrument of its *mission civilisatrice*, its civilizing mission to educate the world about the ways of French culture, including its devotion to human rights; in other words, the circulation and dissemination of ideas which, in due time, would also come back in the other direction, from the colonies to the *métropole*.

Although not everyone at the time, as exemplified by that insightful observer of unfolding history, Alexis de Tocqueville (Tocqueville 1841), basked in the glory of colonization, many

did believe that these brutal colonial wars would in the end advance the cause of humanity. As such, these wars were seen as a primary instrument of globalization. Strategists of colonial war such as Joseph Gallieni and Hubert Lyautey concurred, and their idea of a spreading "oil stain" approach was based on the remarkable force, that is, interdependence and interconnectivity. People and governments, however, were not always convinced about the benefits of waging wars of conquest in faraway lands, and the economic benefits of colonization were never proven to be as great as was advertised by those who advocated foreign invasions. The idea put forth by V.I. Lenin that imperialism may have been the last stage of capitalism largely overstated the benefits that imperial ventures may have brought capitalism in general (Lenin 1975). Still, this idea gained much traction at the time and still lives on in one form or another today, most notably through the discourse of antiglobalization activists. Be that as it may, at least in France, colonization was indeed perceived by many to enhance globalization, while globalization itself was seen by most as a manifestation of progress. Of course, colonization was never a peaceful activity, and even the euphemistically named strategy of "pacification" involved much violence, including violence against civilian populations. In due time, colonization brought upon decolonization, with more blood spilled around the globe through the various wars of independence that marked the geopolitical landscape of the 1940s, 1950s, and 1960s, right through the 1970s, with the retreat of Portugal from Africa.

What of globalization in its latest iteration? Although globalization as such is historically not a new phenomenon, its latest incarnation can be traced back to the Cold War and its aftermath. As such, it has been largely perceived or construed as the opposite and perhaps even as the antidote to the power politics that characterized the bipolar rivalry between the East and the West. Although, in effect, the Cold War tensions, coupled with the threat of nuclear Armageddon, did produce in the end a certain type of peace, albeit one based, in the words of Albert Wohlstetter, on the "balance of terror" (Wohlstetter 1958) or, at least, a stability of sorts, this period is unequivocally associated with the idea of violence, conflict, and war. And, although the world as such did not collapse, "limited" wars erupted here and there for the greater part of the period.

Against this backdrop, the unleashing of the forces of globalization that resulted from the easing of tensions between the Soviet/Russian block and the US-led Western alliance initially generated a sentiment that the age of perpetual peace had at last arrived. The massive closure of military bases that were transformed into theme parks or other such peaceful venues fueled this feeling of hope for a while. This was corroborated by the fact that the post-Cold War transition was altogether smooth, with little if any violence erupting in the dismantling of former Soviet Union. The violent and ugly conflicts of the former Yugoslavia were somehow circumscribed, while the Rwandan genocide was largely understood as an isolated aberration. Given the dramatic circumstances around the unexpected collapse of one of the two superpowers, the result was indeed encouraging.

Still, the end of the Cold War did produce some "indirect" violence, though this violence may have had little to do with globalization. The sudden ease of tension between the two blocs left some proxy allies hanging out to dry, resulting in some nasty struggles for power in places like Zaïre (subsequently renamed Democratic Republic of the Congo). What the collapse of the Soviet Union did result in, however, was a geopolitical reconfiguration of the global balance of power. This, in turn, loosened the alliances of the Cold War and provided greater freedom to the vast majority of states that had been forced to pick one side or the other. This, in turn, pushed several countries to embrace democratic reforms and/or capitalism, with a resulting push for consumerism enhanced by the forces of globalization, one and the other thus feeding on each other. The rise of China, and to a lesser extent of other emerging countries such as India, Brazil, or Vietnam, put a strain on the exploitation of natural resources needed to sustain fast-paced economic growth. This strain, though it had the potential to produce some degree of violence, did not. The wars

resulting from the competition for resources or for water, for example, have not materialized even if tensions between countries, China and Vietnam in the Mekong Delta come to mind, have indeed taken place.

## Globalization, the State and War

But let us now briefly examine the theory that the laissez-faire mechanisms that are behind globalization might enhance the democratic process which, in turn, leads to a more peaceful environment. This idea is founded on three premises. The first one, notably developed in the eighteenth century by the Baron de Montesquieu (1949), asserts that trade between countries will encourage them to avoid wars that might damage their economies. The second premise states that trade, and capitalism in general, enhances democracy. The third premise is that democracies are peaceful, the idea being that the more democracies there are, the more peaceful the world will become.

The first idea, that commerce brings peace, has been refuted by history time and time again, most notably through the events that led active European trading partners to go to war on at least two major occasions in the twentieth century. Once again, this outlook is based on a rational vision of political relations that overlooks other important triggers of conflict. The second idea, that capitalism is a democratizing force, popular from the 1950s to the 1980s, might be true in some instances, but many examples, first and foremost that of China, also show that economic liberalism and political autocracy are not incompatible nor that the forces of capitalism will inevitably push a society toward democracy. The third idea, that democracies are peaceful, is true but only partly and conditionally so (Doyle 1997; Doyle 2011; Russett 1993; Weart 1998). That democracies rarely, if ever, go to war against each other is an irrefutable fact of history (although that history is only a century or so old). But this is only true if we are talking about full-fledged democracies (definitions of which are somewhat tentative) and not what observers refer to as "ill-liberal democracies" which may actually be characterized as even more inherently bellicose than dictatorships. More importantly, although democracies may be at peace with one another, they tend to be trigger happy toward non-democracies. So, while it could be argued that globalization may have enhanced the push toward democratization, the fact that this process is, both from a quantitative and qualitative perspective, unfinished means that, since this process is indeed unfinished, peace through democracy is not altogether a global phenomenon.

Let us now examine another issue that is at the heart of globalization and war: the state. Globalization has been regularly characterized as having had the effect of eroding the state. Until recently, perhaps as late as the end of the Cold War or even the end of the twentieth century, the state (as in "nation-state") enjoyed its longtime status of being the dominating element of the "grand chessboard," to use the apt expression coined by Zbigniew Brzezinski (1998), namely, the geopolitical and geostrategic landscape. And, as such, the nation-sate enjoyed what Max Weber famously described as the "monopoly of legitimate use of force" (Weber 1919, 2015). In other words, nation-states and their representatives, elected or nonelected governments, were deemed the only authority that could legitimately use force. The erosion of the state, although most certainly overamplified, can be qualified as a real phenomenon even if actually measuring this erosion is both difficult and problematic. But the emergence, through the forces of globalization, of economic actors that bear some weight in world affairs is indeed palpable. Some multinationals, for instance, weigh more economically than many small countries, and their political influence is a reality. But while multinationals may occasionally lobby a government to intervene militarily, their impact in these matters is always indirect. Thus, in terms of the practical and legitimate use of force, the state still enjoys a primacy that no other actor is close to contesting just yet. Collective security organizations such as the United Nations of NATO that have some authority on these matters are not independent organizations but, rather, are constructed around groups of states that decide when and where to

intervene militarily and who are the purveyors of the human and material resources to intervene.

Still, there is one area where the state has lost some of its luster, which is in its capacity, individually or collectively, to tackle and, potentially, solve all problems that fall outside of the realm of national sovereignty. Until fairly recently, most problems that occurred in that area we call "international" were within the grasp of states, whether they acted independently, multilaterally, or as part of larger organizations such as the United Nations. But one of the effects of globalization is to have generated issues and problems that states, or organizations comprised of states, have until today been largely unable to cope with due to a lack of institutional structures designed to deal with such problems. These include environmental issues, economic and financial issues, security issues, migration, and a host of new and growing problems that states are ill equipped to resolve, sometimes even to understand or accept, or lack the power, the means, or the legitimacy to try to overcome. This sometimes frustrating reality has produced two reactions. The first one is a genuine attempt to get together and tackle certain issues, such as the deterioration of the global environment. Such a reaction produced the COP 21 accords of Paris in 2015 which has been construed either as a groundbreaking event or as a lost opportunity to do much more. Whatever one's opinion on the matter, an effort was indeed mustered to move, or try to move, in the right direction. The second reaction has been one of fallback or withdrawal, as exemplified by the Brexit vote of 2016 that saw the United Kingdom pull out of the European Union and, the same year, the populist vote that projected the jingoistic Donald Trump to the Oval Office. Although it is too early at the time of this writing to tell how these developments might generate any kind of violence in the future, these events, both produced by the democratic process, can hardly be described as promoting the type of interstate cooperation that will be needed to deal with the effects of globalization. Nor will this move toward a more traditional and restricted vision of the national interest roll back the progressive erosion of the state. To the contrary, chances are that this trend, which might or might not gain traction elsewhere, will precipitate the demise of the state with few options left in the horizon for other institutions to grab the mantle.

But, while the state still enjoys it monopoly on the "legitimate" use of force, other entities have claimed their right to use political violence regardless of whether their authority to do so is considered (by established governments) legitimate or illegitimate. Such groups, be they guerrilla groups, urban guerillas, or what are commonly described as "terrorist groups" (a more accurate, if tedious, description would be "groups that employ techniques destined to inflict terror"), of course, predate globalization. But, with globalization, such groups have emerged or morphed into transnational outfits or, at least, into entities with a transnational outreach and perspective. The more famous of these disruptive transnational groups, Al-Qaïda and ISIS (Islamic State of Iraq and Syria, also known as ISIL (Islamic State of Iraq and the Levant) or Daesh), have both indirect and direct links to globalization.

Al-Qaïda emerged in the aftermath of the Soviet intervention in Afghanistan (1979–1989) as an offshoot of the resistance fighters that had fought the Russians. In this respect, Al-Qaïda was not initially a product of globalization but more simply of the Cold War rivalry. Nevertheless, the effects of globalization after the Cold War gave it a new purpose and new tools and means for its recruitment, its propaganda, and its deeds. ISIS, which was created in the year 2006, is itself an offshoot of Al-Qaïda. ISIS prospered and came into its own thanks to two unrelated events: the decision, somewhat murky if not unclear, by President George W. Bush to invade Iraq in 2003 and the domino effects of the Arab Spring (2010/2011) on Syrian politics. While the first event cannot be directly linked to globalization but to a combination of personal resentment, hubris, greed, and political miscalculation, the second one can be qualified as a consequence, at least in part, of the effects of globalization on a region that was rocked by a random series of cascading events that swept several countries after the self-immolation of a Tunisian street vendor.

The general malaise that grips a good portion of the Arab world can be blamed at least in part on the effects of globalization. Globalization no doubt contributed to vast discrepancies between those regions that did, and those regions that did not, climb on the bandwagon of globalization, for whatever reasons, most of them complex. Indeed, many Arab countries in North Africa and in the Middle East have been unable to create or sustain the type of economic growth enjoyed by countries in other parts of the world. Many of them have also endured governments often prone to corruption and guilty of mismanagement and, generally, bad governance. This has resulted in vast portions of the young population being unemployed, a recipe for resentments, social conflict, and violence. In the most extreme cases, such as Syria or Yemen, this has generated civil war and a power vacuum which radical groups have been quick to occupy. It is among this disenfranchised, and – not to be overlooked – often bored, population that radical Islamist groups have aggressively recruited members. Far from touching so-called failed states like Somalia, this latest form of totalitarianism has also affected countries which long appeared immune to these developments. Tunisia, for example, which for years was portrayed as a successful example of a newly independent, well educated, rapidly modernizing, and vibrant nation, has surprisingly become one of the main breeding ground for terrorists.

These radical groups, whose religious discourse has alienated the greater part of mainstream Muslims, have utilized globalization as a tool for propaganda while exploiting some of the technical advantages offered by the communications revolution that is an integral part of globalization. Globalization has invariably been portrayed by these groups as the symbol of a decadent Western world prone to exploit other regions to sooth its greediness and its devotion to crass consumerism. In opposition to this tentacular model which, according to these groups, is driven by a desire from the Western nations to impose their hegemony on the entire world, they offer an alternate model that harks back to the golden age of Islam and the Great Caliphate, an antithesis to an immoral, atheistic, corrupting, and impure globalized West. These groups have also made good use of the Internet and various devices such as smart phones (sometimes used, also, to detonate bombs) that allow transnational flows of information that are unhampered by traditional borders. This wave of terrorist activity, though it has provoked a limited number of victims in the West, especially if one compares the figures with events such as World War I or World War II, has had a profound psychological effect on the countries and populations directly touched and on their neighbors. It is also, in part, responsible for the resurgence of nationalism and populist politics in Europe and North America, which, though it is too early to tell at the time of this writing, may significantly diminish the global geopolitical stability of the planet.

Just as important, on the regional level, transnational terrorism has greatly contributed to the general instability of the Middle East and, increasingly, the Sahel and the northern parts of sub-Saharan Africa. In the Middle East, in particular, this has led to a resurgence of the power struggle between the great regional powers competing for regional hegemony: Iran, Turkey, and Saudi Arabia. This dangerous game, which inevitably involves other regional actors as well as external players, only adds more volatility to a region already prone to conflict and instability.

Lastly, let us now look at another aspect of the violence/globalization conundrum: the effects of wars on globalization. Tarik Barkawa, who has written extensively on the topic, argues convincingly that "by means of the interconnections it occasions, war is transformative of world politics and of the people and places it reaches out and touches," with globalization being defined as "a general property of the 'international,' as relations of interconnection and mutual constitution" (Barkawa 2006, 167). For Barkawa, this means that "From a war and society perspective, war can be seen as an occasion for interconnection, as a form of circulation between combatant parties. In and through war, societies are transformed, while at the same time societies shape the nature of war. War is refigured as a globalizing force, as a multidimensional form of connection and constitution between peoples and places" (Barkawa 2006, 169).

In this respect, the dramatic events that unfolded with the collapse of Syria in the year 2010 have provided grist to the mill of this argument. The outflow of refugees from Syria who reached Europe and America for asylum pushed the governments and peoples of various countries that found themselves on the receiving end to react. The attitudes adopted varied immensely, from callousness, rejection, and indifference to generosity, acceptance, and hospitality. Whatever the long-term consequences might be in the future, including for the European Union, this refugee crisis undoubtedly increased and indeed changed the nature of the relationships between Europe, North America, and the Middle East while heightening the level of interconnectivity between them, in ways that may be found to be negative by some, positive by others.

## Conclusion

While traditional wars pitting large armies against one another have become extremely rare, the new types of conflicts which are now characteristic of the twenty-first-century warfare will in many different ways impact regional and global interconnectivity between countries, regions, and peoples. At the same time these conflicts will, in all probability, have a lesser propensity than in the past to be circumscribed to one zone or area. As a consequence, collective violence, whatever form it may take, will in all likelihood reverberate far beyond its initial source. Throughout history, wars have been with commerce and religion, one of the main conveyors of cross-cultural interconnectivity. In the age of globalization that is ours, collective forms of violence old and new will continue to play this role, in ways that probably only future generations of historians will be able to assess and comprehend to their fullest extent.

# Globalization and War

Joseph M. Siracusa
RMIT University, Melbourne, VIC, Australia

The Obama administration came into office determined to reverse what it saw as the Bush administration's mistakes and "rebalance [the United States'] long-term priorities so that we successfully move beyond today's wars, and focus our attention and resources on a broader set of countries and challenges" (Barack Obama, "The National Security Strategy of the United States of America," The White House: Washington DC, 2010, p. 9. Portions of this essay have been adapted from my recent study, with Aiden Warren, *Presidential Doctrines*: *U. S. National Security from George Washington to Barack Obama*, New York: Rowman & Littlefield, 2016). Under the leadership of his predecessor, George

W. Bush, the United States had witnessed the first attack upon its soil since Pearl Harbor and, in response, waged a "War on Terror" that would ultimately become the defining legacy of the president's tenure in office. Of course, within this war, the Bush administration aggressively contested and debunked the enduring mainstays of international law, including the legal rationalization for military engagement via its interchangeable use and interpretation of preemption/prevention and the disposition in which recidivists of war could be captured, questioned, and tried (The estimates for the costs of the wars in Iraq and Afghanistan range from 1.5 to 6 trillion dollars, while a 2010 estimate by the Washington Post suggests that "some 1,271 government organizations and 1,931 private companies now work on programs related to counterterrorism, homeland security and intelligence in about 10,000 locations across the United States." National Priorities Project, "Cost of National Security," *National Priorities Project*, January 24, 2014, available at: http://nationalpriorities.org/cost-of/; Ernesto Londono, "Iraq, Afghan Wars Will Costs to $4 Trillion to $6 Trillion, Harvard Study Says," *The Washington Post*, March 29, 2013, available at: http://www.washingtonpost.com/world/national-security/study-iraq-afghan-war-costs-to-top-4-trillion/2013/03/28/b82a5dce-97ed-11e2-814b-063623d80a60_story.html; and Dana Priest and William M. Arkin, "A Hidden World, Growing beyond Control," *The Washington Post*, September 2010, available at: http://projects.washingtonpost.com/top-secret-america/articles/a-hidden-world-growing-beyond-control/). In contrast, Obama sought to restore the US position *away* from what he saw as debatable expeditions and – as a key focus of this chapter – the legal obfuscation pertaining to the way it wielded its unilateral use of force (*see* Aiden Warren and Ingvild Bode, *Governing the Use-of-Force in International Relations. The Post-9/11 US Challenge on International Law*, Basingstoke: Palgrave Macmillan, 2014, p. 84).

In enunciating the broad terms of his foreign policy transformation early in his first term, Obama stated that he would work to reestablish America's international standing, particularly in the Muslim world, encourage multilateralism, increase cooperation with China on global issues, end the wars in Iraq and Afghanistan, participate in dialogue with Iran and North Korea as part of his nonproliferation goals, establish lasting peace in the Middle East, address climate change through innovative legislation and international agreements, and help assuage global poverty. While covering a broad and ambitious canvas, it was clear that the new president "sought nothing less than to bend history's arc in the direction of justice, and a more peaceful, stable global order" (Amitai Etzioni and Alexandra Appel, "Book Review: Martin S. Indyk, Kenneth G. Liberthal, and Michael E. O'Hanlon, Bending History: Barack Obama's Foreign Policy," *Society*, volume 49, Number 5, August 21 2012, available at: http://icps.gwu.edu/files/2012/09/D85_Bending_History.pdf). For many analysts, the election of Obama appeared to be a long delayed "straightening up" of America. Having dissipated the "world's sympathy" in the period after 9/11, making the securitization of terrorist threats the centerpiece of its foreign policy, coercing other states to support its agenda in Iraq and beyond, and disregarding its mission to rebuild failing states, the 2008 electoral victory was an opportunity in which the United States could reinstate its international integrity, regardless of the situation inherited from the predecessor. Without a doubt, part of Obama's appeal to the rest of the world was his apparent denunciation of the Bush administration's effort to proselytize about the American model or the unilateral "democracy agenda" (David E. Sanger, *The Inheritance*, London: Bantam Publishers, 2009, p. 447).

For the Bush administration, the international order was centered solely on US unipolar preeminence, with America exercising its unimpeded power to keep others in check. In the Obama prescription, the international order would ascend from the connection of America's preeminence with its formation principles, in which the United States would use its power to shape consensual and legitimate mechanisms of global governance (G. John Ikenberry, "America's 'security trap,'" in Michael Cox and Doug Stokes (Eds.), *U.S. Foreign Policy*, Oxford: Oxford University

Press, 2008, p. 431. *See*, Aiden Warren, *The Obama Administration's Nuclear Weapon Strategy*: *The Promises of Prague*, Routledge, New York, 2014, p. 3). This ostensible transition, Obama argued, necessitated a move in which the United States would reassert its "soft power" and attract support through ethical leadership (Joseph S. Nye Jr., "The Decline of America's Soft Power," *Foreign Affairs* 83, no. 3, 2004, available at: http://www.foreignaffairs.com/articles/59888/joseph-s-nye-jr/the-decline-of-americas-soft-power). In pursuing this line, the dual preservation of American security and ideals during Obama's time in office would reciprocally underpin and feature regularly in his speeches and public declarations. However, despite these marked sentiments, this chapter will argue that while the Obama Doctrine has encountered very distinct challenges in pursuing such ambitious goals – the departure from Iraq and Afghanistan, the Arab Springs and subsequent instability in those states, the Syrian crisis, the Ukraine crisis, the P5 + 1 negotiations with Iran, the emergence of ISIS, and the deterioration of bilateral relations with Russia (to name a few) – it has also demonstrated a tendency to be ambivalent, at times prevaricative, compromising, and cautious in its doctrinal approach. And while Obama's disposition was initially greeted by many as a refreshing departure from the unrestrained unilateralism of Bush, the aforementioned tendencies have often led the president into vacillating waters. In examining the Obama Doctrine's ambivalence, the chapter will specifically assess its use-of-force approach. It will argue that despite rhetoric suggesting that the administration would move decisively *away* from the Bush position, it has continued and – in specific instances – even expanded force (i.e., drones), while also displaying a degree of inconsistency in dealing with Libya, Syria, and the non-state actor, ISIS.

## Doctrinal Dualism

The election of Barack Obama as the 44th President of the United States pledged important vicissitudes to US foreign policy and the overall approach to international affairs. Not surprisingly, the new president's first concern was to address the financial crisis, and to some extent, he has been able to get the economy in decent working order. As stated by John Cassidy, "even accounting for the roughly five million jobs that were lost during the Great Recession and its aftermath, about seven million more Americans now have work than when the President took office, in January, 2009." Additionally, the budget deficit "sits at 2.8% of G.D.P., less than it was in the last year of the Bush administration, when it was 3.1%. Stock prices and corporate profits, as Obama pointed out, have never been higher" (John Cassidy, "Obama's Well-Earned Victory Lap on the Economy," *The New Yorker*, March 19, 2015, available at: http://www.newyorker.com/news/john-cassidy/obamas-well-earned-victory-lap-on-the-economy). In the United States' core security areas, however, things have not fared as well.

In Iraq, Obama replaced the delicate stability attained via the "surge" for a methodical and comprehensive military withdrawal in late 2011; taking a major risk that the inroads made could continue on indefinitely without a significant US presence or prominent US involvement. Iraq's sectarian and ethnic divisions – subdued toward the end of the 2003–2011 US military intervention in Iraq – have reemerged to spur a significant challenge to Iraq's stability and to US policy in Iraq and the broader Middle East region. The antipathy of Iraq's Sunni Arabs toward the Shiite-dominated central government contributed to the seizure in 2014 of nearly one-third of Iraqi territory by the Sunni Islamist extremist group, Islamic State (also known as the Islamic State of Iraq and the Levant or ISIL). Iraq's Kurds have been separately entangled in political and territorial disagreements with Baghdad, although those differences have been somewhat deflected with the focus on the mutual fight against the Islamic State (Kenneth Katzman and Carla E. Humud, "Iraq: Politics and Governance," Congressional Research Service report, November 13, 2015, available at: https://www.fas.org/sgp/crs/mideast/RS21968.pdf). In Afghanistan, at the end of 2014, the United States and allied states completed a

transition to a smaller mission comprising mainly of training and advising the Afghanistan National Defense and Security Forces (ANDSF). However, based on assessments that the ANDSF was having difficulty thwarting advances by the Taliban and other militant groups (exemplified by the insurgent overrunning of the northern city of city of Kunduz in late September 2015), President Obama announced on October 15, 2015, that approximately 10,000 US military personnel would stay on in Afghanistan through 2016 (Kenneth Katzman, "Afghanistan: Post-Taliban Governance, Security, and U.S. Policy," Congressional Research Service report, October 15, 2015, available at: https://www.fas.org/sgp/crs/row/RL30588.pdf).

Not surprising, the struggle to secede from these two theaters has deeply impacted Obama's responses to other security situations during his time in the White House. Presented with new and emerging scenarios for major military interventions, the president's doctrine has either repudiated or authorized only the minimum required to achieve what can be deemed as imperfect – and at times – unclear goals. His management of the "red line" on Syria's use of chemical weapons – first proclaiming a significant pledge, then irresolute about living up to it, then frantically deferring to Congress for a decision – was an example "in embarrassingly amateurish improvisation." Additionally, his attempt at an "immaculate intervention" in Libya essentially repeated – albeit on a much smaller scale – the Bush administration's basic error in Iraq, ousting a government without a clear strategy for what comes next, leaving behind a vacuum for chaos (Gideon Rose, "What Obama Gets Right: Keep Calm and Carry on the Liberal Order On," *Foreign Affairs*, September/October, 2015, p. 10). Indeed, from Syria to Ukraine and Yemen to Iran, the Obama administration has been resolute in its drive to avoid another entanglement. However, in avoiding boots on the ground or even bombers in the air, Obama's national security suite – while encompassing sanctions and negotiations (Ibid., pp. 6–7) – has veered in unsettling directions through the amplification of drones or a proclivity to be somewhere "in the middle."

Indeed, Obama came to office with a belief that reducing the United States' substantial military and political involvement in the Middle East was an important national security interest objective. The occupation of Iraq and the immoderations of the war on terrorism had left the United States overstretched, particularly at a time of economic calamity. "Rightsizing" the United States' imprint in the region necessitated not only reducing its physical presence but also undertaking a more restrained diplomacy, seceding back and galvanizing allies to play a greater role in looking after their own security. Obama has for the main extent adhered steadily to this strategy and has resisted most efforts to force it off track, particularly from a Washington that is so "hard-wired for the exercise of American power" (Marc Lynch, "Obama and the Middle East: Rightsizing the U.S. Role," *Foreign Affairs*, September/October, 2015, pp. 18–19). Yet for all of Obama's analytic perspicacity, the application of his policies has often struggled to meet the promises of his rousing speeches. The administration has not always communicated its policies effectively to varying publics – at home, in the Middle East, and broader international community – and has more often than not been viewed by many as embodying ongoing hypocrisies and stark contradictions. Certainly, efforts to remain balanced and non-interventionist – yet include a preparedness to use force from a distance – have frustrated "partisans on all sides who wanted unconditional U.S. support rather than an honest broker" (Ibid).

Of course, the downsizing of the US global role and the withdrawal from exposed forward positions have led to a situation where instead of being mollified, the United States' adversaries have become emboldened and American interests and values have increasingly been challenged. But as the administration argues, it has not abandoned traditional US grand strategy; it has been more willing perhaps "to sacrifice the periphery, both functional and regional" (Rose, "What Obama Gets Right," pp. 6–7). As Obama stated in 2010, the United States "created webs of commerce, supported an international architecture of laws and institutions, and spilled American blood

in foreign lands, not to build an empire, but to shape a world in which more individuals and nations could determine their own destiny, and live with the peace and dignity they deserve" (Lynch, "Obama and the Middle East: Rightsizing the U.S. Role," pp. 18–19). In order to get back to that task, however, the nation needed to "pursue a strategy of national renewal and global leadership – a strategy that rebuilds the foundation of American strength and influence" (Ibid). This would require delineating between wants and needs, while putting some issues and areas to the side (Rose, "What Obama Gets Right," pp. 6–7). Of course, as the chapter will further discuss, in attempting to attain some semblance of balance, the doctrinal pathway has found itself in precarious areas where it has clearly been caught "somewhere in-between," evident in its "pick and choose" approach to the use of force and penchant to *partially* partake in new and emerging theaters of conflict.

## Earlier Signs of Dualism

As indicated thus far, the election of Obama "raised the hopes" that there would be a "dramatic shift in the U.S. attitude towards international law" (Shirley V. Scott, *International Law, U.S. Power*: *The United States' Quest for Legal Security*, Cambridge: Cambridge University Press, 2012, p. 6) and the way it conducted its use-of-force approach and an overall transformation in US foreign policy. The emphasis on US soft power had already been exhibited in many of Obama's campaign public pronouncements and was punctuated during his very first week as president through Executive Orders 13,491 and 13,492 (President Barack Obama, "Executive Order 13491; Ensuring Lawful Interrogations," *The White House*, January 22, 2009, available at: http://www.whitehouse.gov/the_press_office/Ensuring_Lawful_Interrogations; President Barack Obama, "Executive Order 13492 Closure Of Guantanamo Detention Facilities," *The White House*, January 22, 2009, available at: http://www.whitehouse.gov/the_press_office/ClosureOfGuantanamoDetentionFacilities). Executive Order 13941 rescinded the previous Executive Order 13440 that the Bush administration had used to justify its forcible and enhanced interrogation methods by the CIA and, fundamentally, transformed the common Article 3 (Article 3, shared by all four Geneva Conventions, establishes fundamental rules for all varieties of non-international armed conflicts, such as humane treatment of prisoners without distinction. International Committee of the Red Cross, "Convention (III) Relative to the Treatment of Prisoners of War. Geneva, 12 August 1949," *ICRC Treaties and Documents*, 1949, available at: http://www.icrc.org/ihl/INTRO/375?OpenDocument) of the four Geneva Conventions. Executive Order 13491 emphasized legal interrogations and prompted the termination of clandestine CIA detention facilities that elicited extensive criticism during Bush's two terms (However, Executive Order 13941 does not explicitly revoke the Bush administration's rendition practices. This point is considered in more detail at the end of the chapter). When asked about the conditions in which the president may be permitted to disregard international human rights treaties in a campaign questionnaire, Obama responded that "it is illegal and unwise for the President to disregard human rights treaties that have been ratified by the United States Senate, including and especially the Geneva Conventions" (Charlie Savage, "Barack Obama's Q&A," *The Boston Globe*, December 20, 2007, available at: http://www.boston.com/news/politics/2008/specials/CandidateQA/ObamaQA/). In a questionnaire on the role of international law in US foreign policy issued by the American Society on International Law (ASIL), Obama maintained this line in stating that the United States "can detain and interrogate suspected terrorists – lawfully and humanely – without amending the laws of war" and should be "championing the Geneva Conventions, instead of looking for ways to evade or rewrite them" (American Society of International Law, "International Law 2008 – Barrack Obama." As the survey is no longer available on the ASIL website, quoted from Duncan Hollis, "President Elect Obama on International Law," *Opinio Juris*, November 6, 2008, available at: http://opiniojuris.org/2008/11/06/president-elect-obama-on-international-law/).

In his thorough evaluation of the first year and a half of the Obama administration, Bob Woodward described the then president-elect's surprised response when informed by the CIA of the six "enhanced" interrogation techniques it was still using (Bob Woodward, *Obama's Wars*, New York: Simon and Schuster, 2010, p. 65). As such, Obama proceeded to eliminate the CIA's enhanced interrogation program and made the organization adhere to the requirements of the Army Field Manual, which strictly abides by the Geneva Conventions in a strict sense (Ibid., p. 66). Despite these measures, however, an indication of Obama's doctrinal behavior during the course of his two terms in office quickly came to the fore. That is, Executive Order 13491 did not repeal the controversial practice of rendition, i.e., passing purported terrorists to third states for interrogation and (indeterminate) detention. Instead, Executive Order 13491 inaugurated a Special Task Force charged with reviewing US interrogation and transfer policies (Obama, "Executive Order 13491 – Ensuring Lawful Interrogations"), which published its report in the summer of 2009. While endorsing a closer scrutiny of their detention and interrogation conditions, the report also argued that "when the United States transfers individuals to other countries, it may rely on assurances from the receiving country" (Special Task Force on Interrogation and Transfer Policies, "U.S. Task Force Report on Interrogations and Transfers," *The American Journal of International Law* 103, no. 4, October 1, 2009, p. 762), a clear perpetuation of the Bush administration's comparable "assurances" caveat (Stephen L. Carter, *The Violence of Peace*: *America's Wars in the Age of Obama*, New York, NY: Beast Books, 2011, p. 52). Notwithstanding the considerable legal condemnation this practice has received in the context of violating basic human rights – prohibition of torture, arbitrary arrest, and forcible transfer that are preserved in the defining international human rights treaties such as the 1984 *Convention against Torture and Other Cruel*, *Inhuman or Degrading Treatment or Punishment* and the 1966 *International Covenant on Civil and Political Rights* – rendition is still considered by many administration officials as a viable option (Nahal Zamani, "Rendition Program to Continue Under Obama's Watch," *American Civil Liberties Union*, August 27, 2009, available at: https://www.aclu.org/blog/human-rights-national-security/rendition-program-continue-under-obamas-watch; *See*, Warren and Bode, *Governing the Use-of-Force in International Relations*, p. 84) and a "practice [that] has continued under President Obama in only cosmetically varied guises" (Dan McLaughlin, "The Obama Administration Goes Big On Extraordinary Rendition: It Is More Important That We Pretend To Virtue Than That We Practice It," *Red State*, October sixth, 2015, available at: http://www.redstate.com/2015/10/06/obama-administration-goes-big-extraordinary-rendition/).

By relying on the assurances that detainees will not be subject to torture or inhumane treatment, questions pertaining to the president's position need to be asked (NYU Center for Human Rights and Global Justice, "Briefing: Torture by Proxy: International Law Applicable to 'Extraordinary Renditions'" NYU, December 2005, 6, available at: http://www.chrgj.org/docs/APPG-NYU%20Briefing%20Paper.pdf). Why else would the United States continue to send individuals to destinations where torture is probable, rather than detaining them themselves, if not because it relies on this practice as a useful means of attaining intelligence? This point has also been highlighted by Stephen Carter who has argued that the "temptation to torture" has been intrinsic to the demands that the "War on Terror" places on procuring information (Carter, *The Violence of Peace*, p. 50). In this regard, he defines Obama's policy on coercive interrogation as being "tragically" logical, where in continuing to pursue "the War on Terror, he had no choice but to decide, also, to continue to press, and press hard, for information" (Ibid., p. 67). In a more forthright fashion, Dan McLaughlin argues that Obama is simply "handing over vastly larger civilian populations to be annihilated by notoriously brutal foreign regimes in the name of keeping America's hands apparently clean of atrocities we intend to wink-and-nudge encourage." By "using unscrupulous allies to do things we dare not do ourselves," this

"may explain the Obama administration's foreign policy in ways that go far beyond interrogation and detention policy" (McLaughlin, "The Obama Administration Goes Big On Extraordinary Rendition").

Indeed, the embedded queries and "finer" points of Obama's action against enhanced interrogation *are* very much characteristic of his use-of-force policies and illustrative of his broader foreign policy/doctrinal position. When looking at his speeches in Prague in April 2009, in which he promoted a nuclear-weapon-free world, and at Cairo University in June 2009, which called for "a new beginning between the U.S. and Muslims around the world" (President Barack Obama, "Remarks by the President on a New Beginning," *The White House*, June 4, 2009, available at: http://www.whitehouse.gov/the_press_office/Remarks-by-the-President-at-Cairo-University-6-04-09), dualisms abound. While the type of rhetoric used in these speeches exemplifies Obama's ambition and preparedness to undertake the diplomatic route through engagement and multilateral settings, they only tell part of the equation. If one reads between the lines, is it evident that such speeches or responses display another propensity. As noted by Peter Bergen, Obama's fervent criticism of the US intervention in Iraq does by no means make him a pacifist nor does it necessarily make him opposed to the unilateral use of force (Peter L. Bergen, "President Obama, Warrior in Chief," *The New York Times*, April 28, 2012, sec. Opinion/Sunday Review, available at: http://www.nytimes.com/2012/04/29/opinion/Sunday/president-obama-warrior-in-chief.html). Obama's penchant to hedge was on display as far back as 2007 when in a Presidential nomination speech, he argued that the Bush administration chose to fight the "wrong war" in Iraq at the expense of focusing on the "right war" against Al-Qaeda and affiliates in Afghanistan/Pakistan. In specific reference to the terrorist safe havens in Pakistan's tribal areas, Obama argued that if "actionable intelligence about high-value terrorist targets" is available "and President Musharraf [then President of Pakistan] won't act, we will. . . . I will not hesitate to use military force to take out terrorists who pose a direct threat to America" (Barack Obama, "Obama's Speech at Woodrow Wilson Center," *Council on Foreign Relations*, August 20, 2007, available at: http://www.cfr.org/elections/obamas-speech-woodrow-wilson-center/p13974).

Other signs of then presidential candidate Obama's stance on the use of force were also on display in early 2008. Asked about his views on the preemptive use of force doctrine championed by his predecessor, Obama replied that he would "not hesitate to use force, unilaterally if necessary, to protect the American people or our vital interests whenever we are attacked or imminently threatened." In making his case, he pointed to those "circumstances beyond self-defense" where "using force" is an acceptable option, particularly when participating in "stability and reconstruction operations, or to confront mass atrocities." However, "when we do use force in situations other than self-defense, we should make every effort to garner the clear support and participation of others – as President George H. W. Bush did when we lead the effort to oust Saddam Hussein from Kuwait in 1991" (Quoted from Hollis, "President Elect Obama on International Law"). In this regard, Obama unequivocally emphasized the US prerogative to use force "unilaterally if necessary" in conditions covering self-defense situations in which the United States or its "vital interests" are "imminently threatened." Additionally, he seemingly expanded the potential unilateral use of force to "circumstances beyond self-defense," in other words, for humanitarian and post-conflict-related purposes. Legal scholars such as Christian Henderson highlight the consequences of depicting the use of force as "necessary" in this respect (Christian Henderson, "The 2010 United States National Security Strategy and the Obama Doctrine of 'Necessary Force,'" *Journal of Conflict & Security Law* 15, no. 3, 2010, pp. 403–434). A Security Council decree with regard to using force in these instances is not clearly stated, which suggests that the Obama administration chose to view unilateral humanitarian intervention as a feasible policy option – an option not supported by international law. Further, while Obama references multilateral support as being key when using force in situations other

than for self-defense purposes, this is prefixed by a provisional – "we *should* make every effort to garner the clear support and participation of others." Despite choosing to remove the terms "preemptive use of force" in letter, the sentiment remained (*see* Warren and Bode, *Governing the Use-of-Force in International Relations*, p. 84).

## The National Security Strategy (2010)

It was the Obama administration's *National Security Strategy of 2010* that articulated the doctrine's official position pertaining to the use of force and the ongoing conflict with Al-Qaeda. With continuous allusions to the significance of international co-operation and commitment to international norms and the rule of law, the document appeared to be unequivocally different to the formulations used by his predecessor (President Barack Obama, "The National Security Strategy of the United States of America 2010," *The White House*, May 2010, available at: http://www.whitehouse.gov/sites/default/files/rss_viewer/national_security_strategy.pdf). Bush's "War on Terror" platform was, for instance, replaced with the more palpable war against the specific Al-Qaeda network and its affiliates (Ibid., p. 20), while a clear break in the context of the detention practices and the goal of promoting constructive relations with Muslim groups across the globe was also conveyed. In simple terms, the *NSS 2010* once again attempted to "connect" US soft power and efficacious global leadership in strengthening its commitment to democracy, human rights, and the rule of law (Ibid., p. 2). In emphasizing that such values should not be "compromised in pursuit of security" (Ibid., p. 10), nor involve "brutal methods of interrogation" (Ibid., p. 36), the document stipulated four key commitments: firstly, to "principled engagement;" secondly, to diplomacy; thirdly, to "strategic multilateralism;" and fourthly, to the notion that living through its values makes the Unites States stronger and safer, by following rules of domestic and international law; and "following universal standards, not double standards" (Harold Koh, "The Obama administration and International Law," *U.S. Department of State*, March 25, 2010, available at: http://www.state.gov/s/l/releases/remarks/139119.htm;Christine Gray, "President Obama's 2010 United States National Security Strategy and International Law on the Use of Force," *Chinese Journal of International Law* 10, no. 1, 2011, p. 32).

In contrast to the 2006 Bush *NSS* where there was not an explicit reference to international law, the *NSS 2010* referred to it on three occasions (Obama, "The National Security Strategy of the United States of America 2010," 12, 13, 38), giving predilection to the terms, "international norms" or "international standards" ("International norms" are mentioned a total number of 15 times while "international standards" are mentioned twice throughout the NSS 2010). This was also evident in Obama's Nobel Peace Prize acceptance speech in which he referred to "*standards* that govern the use-of-force" and the "rules of the road" (President Barack Obama, "Remarks by the President at the Acceptance of the Nobel Peace Prize," *The White House*, December 10, 2009, available at: http://www.whitehouse.gov/the-press-office/remarks-president-acceptance-nobel-peace-prize), although on this point, he remained equivocal in the context of where international law sat in the use-of-force domain (Gray, "President Obama's 2010 United States National Security Strategy and International Law on the Use of Force," p. 48). As Christine Gray argued, while this "may not seem a significant difference. . . in a policy instrument such as the NSS, this choice of wording must have been deliberate" (Ibid). Moreover, the three references to international law in the *NSS 2010* were made in the context of applying it – which parenthetically is also the most common setting for references that the document makes to international norms: "We are strengthening international norms to isolate governments that flout them and to marshal cooperation against non-governmental actors who endanger our common security" (Obama, "The National Security Strategy of the United States of America 2010," p. 18; and Gray, "President Obama's 2010 United States National Security Strategy and International Law on the Use of Force," p. 37). Despite some departure regarding the significance of

international law/standards, the *NSS* also argued that military force "may be necessary to defend our country and allies or to preserve broader peace and security, including by protecting of civilians facing a grave humanitarian crisis" (Obama, "The National Security Strategy of the United States of America 2010," p. 22). While the United States would be dependent on an approach encompassing diplomacy, development, international norms, and institutions to help resolve conflicts and thereby "mitigating where possible the need for the use-of-force" (Ibid), the document stated that "... we will exhaust other options before war *whenever we can*, and carefully weigh the costs and risks of *action* against the costs and risks of *inaction*" (Ibid, own emphasis). In essence, the administration appeared to opt for a use-of-force approach that would be a last resort and only used if there was a high probability of victory, very much commensurate with the principles of the just war tradition. Qualifications in the wording and the propensity to uphold a hegemonic disposition, where "[the United States] must reserve the right to act unilaterally if necessary to defend the nation and its interests, yet it will also *seek to adhere* to standards that govern the use-of-force," create all sorts of uncertainty. As Gray further laments, "the formulations 'seek to adhere' and 'whenever we can' are indications of a rather weak commitment" (Gray, "President Obama's 2010 United States National Security Strategy and International Law on the Use of Force," p. 48. The 2003 European Security Strategy (ESS) does not contain explicit references to the use of force but affirms its strong commitment to upholding and developing multilateral institutions and thus the Charter's *jus ad bellum* regime, above all the United Nations, in countering global threats: "The United Nations Security Council has the primary responsibility for the maintenance of international peace and security. Strengthening the United Nations, equipping it to fulfill its responsibilities and to act effectively, is a European priority." European Council, "European Security Strategy: A Secure Europe in a Better World" European Union External Action, December 12, 2003, available at: http://www.consilium.europa.eu/uedocs/cmsUpload/78367.pdf. The 2009 Russian security strategy contains negative references to the "one-sided use of force in international relations" and explicitly notes that "[o]n the world stage, Russia will act from a position founded on an unchanging course . . . on the unacceptability of use of military force in contravention of the United Nations Charter." President of the Russian Federation, "National Security Strategy to 2020," *ETH Zuerich Digital Library*, May 2009, available at: http://www.isn.ethz.ch/Digital-Library/Publications/Detail/?id=154915; *See*, Warren and Bode, *Governing the Use-of-Force in International Relations*, p. 88).

Indeed, as one moves through the *National Security Strategy of 2010*, it soon becomes evident that the document is both a redirection and continuum. The redirection is most evident through the type of rhetoric Obama used and the frequent references to the legitimacy of US actions. Here, force would be used "in a way that reflects our values and strengthens our legitimacy and we will seek broad international support, working with such institutions as NATO and the UN Security Council" (Obama, "The National Security Strategy of the United States of America 2010," p. 20). However, force would be permitted if *necessary*, even on a unilateral basis. For legal scholar Christian Henderson, this necessity-based rationale has been the defining feature of Obama's use-of-force policy (Christian Henderson, "The 2010 United States National Security Strategy and the Obama Doctrine of 'Necessary Force,'" pp. 418–421), where despite Obama seemingly adhering to standing international law with regard to self-defense, he has often diluted the concept of necessity in the context of humanitarian intervention (Ibid., p. 419). In the context of preventive and preemptive use of force, the *NSS 2010* did not contain any specific stipulations. While the document did actually include a distinct section entitled "Use-of-force" (Obama, "The National Security Strategy of the United States of America 2010," p. 22) – unlike Bush's National Security Strategies – there was little substantive discussion or material, leaving many of the contentious issues of its predecessor unresolved. The only pointers were found in a passage relating to

denying safe havens to Al-Qaeda, where in the context of Yemen, Somalia, the Maghreb, and the Sahel, the United States would "disrupt terrorist operations *before they mature*. . . [and] take root" (Ibid., p. 21 own emphasis). The *NSS 2010* also discussed "new practices to counter evolving adversaries" (Ibid), offering one of the few references to the administration's amplified drone usage. Aside from stipulating that the use of force must be a last resort, the *NSS 2010* remained noncommittal on the extent to which the United States still asserted the right of preemptive self-defense or whether it was now pronouncing a right of unilateral humanitarian intervention (*see* Warren and Bode, *Governing the Use-of-Force in International Relations*, p. 90).

Assumptions relating to Obama's ostensible muted prolongation of many of Bush's positions on the use of force in counterterrorism are further highlighted when examining the strategic statements of the president himself, as well as government officials. From the day of his inauguration, Obama repeatedly emphasized the enduring nature of the conflict with Al-Qaeda and the constant threat the organization posed. In an early speech focusing on a new approach for Afghanistan and Pakistan, Obama stated that "multiple intelligence estimates have warned that Al-Qaeda is actively planning attacks on the U.S. homeland from its safe haven in Pakistan" (President Barack Obama, "Remarks by the President on a New Strategy for Afghanistan and Pakistan," *The White House*, March 27, 2009, available at: http://www.whitehouse.gov/the-press-office/remarks-president-a-new-strategy-afghanistan-and-pakistan. Compare also for similar references President Barack Obama, "Remarks by the President after the Trilateral Meeting with President Karzai of Afghanistan and President Zardari of Pakistan," *The White House*, May 6, 2009, available at: http://www.whitehouse.gov/the-press-office/remarks-president-after-trilateral-meeting-with-president-karzai-afghanistan-and-pr; and President Barack Obama, "Remarks by the President in State of Union Address," *The White House*, January 25, 2011, available at: http://www.whitehouse.gov/the-press-office/2011/01/25/remarks-president-state-union-address). As such, this imminent threat to the United States justified the continued use of force in self-defense: "And we will insist that action be taken – *one way or another* – when we have intelligence about high-level terrorist targets" (Obama, "Remarks by the President on a New Strategy for Afghanistan and Pakistan," own emphasis). The focus on the continuing imminence of the threat was regularly combined with accentuating that the United States did not enter into the Afghanistan war voluntarily but necessarily had to use force in self-defense. As stated at the time, "We did not choose this war. This was not an act of America wanting to expand its influence; of us wanting to meddle in somebody else's business. We were attacked viciously on 9/11" (President Barack Obama, "Remarks by President Obama to the Troops in Afghanistan," *The White House*, May 1, 2012, available at: http://www.whitehouse.gov/the-press-office/2012/05/01/remarks-president-obama-troops-afghanistan). Although repeatedly championed by Obama as a "war of necessity" in contrast to the "war of (bad) choice" in Iraq, the war in Afghanistan was at best a preemptive war and at worst a preventive war of self-defense. It was certainly not waged in response to an imminent attack but rather a preventive response to an attack that *might* happen sometime in the future, at an unknown time or place (Carter, *The Violence of Peace*, p. 23. *See*, Warren and Bode, *Governing the Use-of-Force in International Relations*, p. 91).

## Compromises and Ambivalence in Obama's Use-of-Force Doctrine

In building on the seminal foreign policy speeches, such as in Prague in April 2009 and at Cairo University in June 2009, the Obama administration made many references to its commitment to international law, its predilection for multilateral cooperation, and its strong belief in international organizations, such as the United Nations (compare, e.g., Zbigniew Brzezinski, "From Hope to Audacity: Appraising Obama's Foreign Policy," *Foreign Affairs* 89, no. 1, 2010, pp. 16–30). However, when it came to interpreting

the right to use military force in self-defense, the changeover from the Bush Doctrine to the Obama Doctrine can be more sufficiently defined as a change in style rather than in substance. Despite never articulating an explicit doctrine of preemptive/preventive force similar to that encompassed in the *NSS 2002*, Obama's counterterrorism campaign continued and extended some of the most dubious facets of the Bush administration in practice, particularly in the expanded context of its drones (*see* Aiden Warren and Ingvild Bode, "Altering the Playing Field: The U.S. Redefinition of the Use-of-force," *Contemporary Security Policy*, 36:2, p. 182).

While Obama administration officials conveyed a variety of legal arguments in the context of Libya, Syria, and its drone program, these have paradoxically led to more ambiguity. In attempting to argue that military force used was in full accordance with international humanitarian law, officials fused so-called *jus ad bellum* and *jus in bello* self-defense in justifying the use of force against terrorist targets inside and outside established theaters of conflict. Interestingly, the second line of argument accounted for much more space than the self-defense arguments – although these worked with an increasingly distant imminence concept, making them clearly preventive in nature. In the context of Libya, the administration came to a relatively quick decision to sanction and use force. In response to Qaddafi's threat to commit atrocities in the rebel stronghold Benghazi in early March 2011, the Security Council authorized a NATO military incursion to "use all necessary means" to protect civilians in Libya via resolution 1973. In contrast, the Syrian crisis saw a rather prolonged response from the administration and only came to a head when it was discovered that the Assad regime had used chemical weapons in the summer of 2013. In this instance, the Obama administration came very close to the use of military force for Syria's violation of a key principle of international law relating to the general prohibition of biological and chemical weapons. Of course, the decision *not* to intervene prompted questions about the subjectivity of intervention conditions, particularly Obama's so-called "red line" on chemical weapons (Glenn Kessler, "President Obama and the Red Line on Syria's Chemical Weapons," *The Washington Post*, 6 September 2013, available at: http://www.washingtonpost.com/blogs/fact-checker/wp/2013/09/06/president-obama-and-the-red-line-on-syrias-chemical-weapons/). Because the United States would not approve these unilateral use-of-force considerations if assumed by other member states, it is evident that it was supporting an exception to the rules pertinent only to *itself* and *its* own interests (*see* Warren and Bode, "Altering the Playing Field," p. 184).

## The Augmentation of Drones

Not surprising, the most contentious aspect of Obama's use-of-force approach relates to the augmentation of drone use. Originally used for surveillance and reconnaissance purposes, armed Predator and Reaper drones have been deployed in Afghanistan since 2001. Targeted killing operations through drone strikes have, however, only become an intrinsic part of US counterterrorism policy since Obama entered the White House in 2009 and have increasingly extended outside of traditional, territorially bound theaters of conflict. While the program's confidentiality makes it difficult to attain precise numbers, it is evident that drone strikes have been targeting "confirmed terrorist targets at the highest level" (John F. Kerry, Remarks at Youth Connect: Addis Ababa Featured by BBC's Hardtalk, Washington, DC: U.S. Department of State, 26 May 2013). In Pakistan, the number of drone strikes sanctioned in Obama's first year in office (52) surpassed the number authorized by Bush during his entire two terms in office(41) (The majority of drone strikes under Bush's leadership, a total of 36, took place during his last year in office in 2008. This indicates the beginning of an emerging trend. New America Foundation, "DroneWars Pakistan: Analysis," 12 April 2015, http://securitydata.newamerica.net/drones/pakistan/analysis.html). The number of drone strikes in Pakistan reached the astonishing levels of 122 in 2010, although these have somewhat decreased (22 drone strikes in the year

2014) as the administration broadened its strikes to other theaters. Indeed, the same period has seen as increasing number of drone strikes in Yemen, peaking at 47 in 2012, as well as a limited number in Somalia (For Yemen see New America Foundation, "Drone Wars Yemen: Analysis," *New America Foundation*, 22 April 2015, available at: http://securitydata.newamerica.net/drones/yemen/analysis.html; for Somalia see General Assembly, *Report of the Special Rapporteur on the Promotion and Protection of Human Rights and Fundamental Freedoms While Countering Terrorism*, *UN Document A/68/389*, 18 September 2013).

While public acknowledgement of drone strikes outside theaters of war only began to garner traction during 2011–2012 – when senior administration officials addressed the issue in a series of speeches – the Obama administration has often used the "successes" of its drone program as a selling point for its broader counterterrorist effort (*see* Warren and Bode, "Altering the Playing Field," p. 185). In the context of Obama's legal justifications on the use of force in the form of such strikes, it is evident that they are based on a diffused standard of imminence, typical of arguments posited during the Bush administration. Here, the legal rationale championed by senior officials has typically combined "state of non-international armed conflict" with "self-defense" arguments. On one hand, the country is in a state of "armed conflict with Al-Qaeda, as well as the Taliban and associated forces and may use force consistent with its inherent right to self-defense under international law." (Harold Koh, "The Obama Administration and International Law," Washington, DC: U.S. Department of State, 25 March 2010). Through this reasoning, the use of force in self-defense is lawful wherever Al-Qaeda is in the process of preparing and executing attacks, be it inside or outside declared theaters of conflict (compare John O. Brennan, Remarks of John O. Brennan, "Strengthening Our Security by Adhering to Our Values and Laws," Washington, DC: The White House, 16 September 2011; Koh, "The Obama Administration and International Law" (note 84); Leon E. Panetta, Remarks of Director of Central Intelligence Agency, Leon E. Panetta, at the Pacific Council on International Policy, Langley, VA: U.S. Central Intelligence Agency, 18 May 2009). Similar to arguments made by its predecessor, the Obama administration has also justified its targeted killings campaign with a legally dubious, preventive version of self-defense which it states is imperative in its quest to "address" terrorists (*see* Warren and Bode, "Altering the Playing Field," pp. 185–186).

Since August 2014, the Obama administration's military operations against the Islamic State in Iraq and Syria have been rationalized in a similar fashion to that of Al-Qaeda, where the United States "would hunt down terrorists who threaten our country, wherever they are. [. . .] This is a core principle of my presidency: If you threaten America, you will find no safe haven" (President Barack Obama, "Statement by the President on ISIS," *The White House*, September 10, 2014, available at: http://www.whitehouse.gov/the-press-office/2014/09/10/statement-president-isil-1). In maintaining this approach, the United States has used military force in the forms of air and drone strikes on the sovereign territory of four states with who it was *not* at war: Pakistan, Yemen, Somalia, and Syria. The administration argued that forcible actions against non-state actors who were orchestrating attacks on the territory of a state who was not sponsoring or supporting them was *still* legal if that state consented to the use of force or was "unwilling or unable" to fulfill its international counterterrorism obligations. The legality of the subjective "unwilling or unable" formula was questioned during the Bush administration's two terms in office. Additionally, the "quality" of state consent deemed necessary has proven elusive; despite Pakistan's persistent expressions of dissent with the Obama administration's use of force on its territory since November 2011, drone strikes continued (compare Declan Walsh, "Pakistani Parliament Seeks End to Drone Strikes," *The New York Times*, March 20, 2012, available at: http://www.nytimes.com/2012/03/21/world/asia/pakistani-parliament-demands-end-to-us-drone-strikes.html; and Ben Emmerson, "Statement of the Special Rapporteur Following

Meetings in Pakistan," *Office of the UN High Commissioner for Human Rights*, March 14, 2013, available at: http://www.ohchr.org/en/NewsEvents/Pages/DisplayNews.aspx?NewsID=13146&LangID=E). In looking at this approach in rawer terms, Rosa Brooks argues "that [. . .] when a government claims for itself the unreviewable power to kill anyone, anywhere on earth, at any time, based on secret criteria and secret information discussed in a secret process by largely unnamed individuals, it undermines the rule of law" (Rosa Brooks, "Testimony of Rosa Brooks, US Senate Judiciary Committee, Subcommittee on the Constitution, Civil Rights and Human Rights, Hearing on Drone Wars: The Constitutional and Counterterrorism Implications of Targeted Killing," Washington, DC: U.S. Senate Judiciary Committee, 23 April 2013). Notwithstanding the precarious precedents, this may establish for other states to follow; it is evident that the Obama administration is not overly perturbed with subjecting its drone program to use-of-force standards enshrined in international law. Aside from the damaging effects US arguments and actions on the use of force have on the legitimate and fundamental standards of international law, questions have been asked on whether this approach is the appropriate strategy to follow when the objective in the long run is combating terrorism (Audrey Kurth Cronin, "Why Drones Fail: When Tactics Drive Strategy," *Foreign Affairs*, 92, 2013, pp. 45–47). While the killing of terrorist actors made for "quick fix" success stories for both administrations, developments on the ground, such as rising membership of Al-Qaeda in the Arabian Peninsula and surges in the numbers of foreign fighters joining the Islamic State, indicate that this approach has not succeeded in defeating their adversaries and, in fact, has more than likely spurred greater (in)security (compare Ivan Eland, "United States Accelerates a Counterproductive Drone War in Yemen," *Huffington Post*, April 23, 2014, available at: http://www.huffingtonpost.com/ivan-eland/united-states-accelerates_b_5198396.html; and Jomana Karadsheh, Jim Sciutto, and Laura Smith-Spark, "How Foreign Fighters Are Swelling ISIS Ranks in Startling Numbers," *CNN*, September 14, 2014, available at: http://www.cnn.com/2014/09/12/world/meast/isis-numbers/index.html).

## Redefining the Use-of-Force in Response to ISIS

The prevarication in Obama's use-of-force approach is further evident when looking at his administration's use-of-force response to ISIS. In his August 2014 notifications to Congress pertaining to the deployments and airstrikes in Iraq, Obama stated that his powers as commander in chief and chief executive under Article II of the Constitution provided him with the authority to execute military action. In subsequent notifications to Congress for airstrikes and other actions in Iraq and Syria posited in September 2014, however, it was argued that two ratified authorizations for use of military force (AUMFs), the Authorization for Use of Military Force (2001 AUMF; P.L. 107–40) and the Authorization for Use of Military Force Against Iraq Resolution of 2002 (2002 AUMF; P.L. 107–243), in essence, also sanctioned certain types of US strikes against the Islamic State in Iraq and Syria, as well as the Khorasan Group of Al-Qaeda in Syria. Notwithstanding this authority, the president indicated on November 5, 2014, that he wanted to open the dialogue in Congress so as to develop a newer version of the AUMF that would "right-size and update whatever authorization Congress provides to suit the current fight, rather than previous fights" authorized by the 2001 and 2002 AUMFs. In his January 2015 State of the Union address, the President called on Congress to ratify an AUMF version, and on February 11, 2015, Obama sent through a draft resolution to Congress to authorize the use of force against the Islamic State of Iraq and the Levant (Matthew C. Weed, "A New Authorization for Use of Military Force Against the Islamic State: Issues and Current Proposals in Brief', Congressional Research Service report, 20 February 2015, pp. 1–2, available at:http://fas.org/sgp/crs/natsec/R43760.pdf). According to the Department of Defense, the resolution aimed to provide the

United States with the authority to address "the terror group in Iraq and Syria" and updated authorizations last passed after the 9–11 attacks (Jim Garamone, "Obama Sends Resolution for Use of Force Against ISIS to Congress," *DoD News*, Defense Media Activity, available at: http://www.defense.gov/news/newsarticle.aspx?id=128167).

In articulating the rationale behind the adjustment, Obama stated that the resolutions would support a strategy in of "systemic and sustained. . .airstrikes against ISIS in Iraq and Syria," including "support and training for local forces on the ground. . .[and] moderate Syrian opposition." In thwarting ISIS attacks, the administration sought to continue its support for an inclusive Iraqi government that united the Iraqi people and strengthened Iraqi forces against ISIS. At the core of the Obama pronouncements was the belief that the resolution provided the necessary balance in terms of "flexibility we need for unforeseen circumstances" (Brookings Institution, "President Obama's Authorization for Use of Military Force (AUMF) against the Islamic State," 24 February 2015, available at: http://www.brookings.edu/events/2015/02/24-obama-aumf-islamic-state). Specifically this applied to scenarios where if "actionable intelligence about a gathering of ISIS leaders" was available, the United States would be prepared to order its Special Forces to take action so as to prelude terrorists from attaining a safe haven (President Barack Obama, "Remarks by the President on Request to Congress for Authorization of Force Against ISIS," 11 February 2015, available at: https://www.whitehouse.gov/embeds/footer). As stated,

> we need flexibility, but we also have to be careful and deliberate. And there is no heavier decision than asking our men and women in uniform to risk their lives on our behalf. As Commander in Chief, I will only send our troops into harm's way when it is absolutely necessary for our national security (Brookings Institution, "President Obama's Authorization for Use of Military Force (AUMF) against the Islamic State").

The Authorization for Use of Military Force (AUMF) against the self-declared Islamic State would authorize the president "to use the Armed Forces of the United States as the President determines to be necessary and appropriate against ISIS or associated persons or forces" but with certain restrictions, reporting requirements to Congress on mission developments biannually, and would only be for a defined period that would "sunset" in 3 years. While some Washington policy analysts and legal experts argued that the AUMF did not give the president ample tractability, others argued that it was balanced and provided Obama with the requisite authorization to execute the current strikes against ISIL (Ibid).

To some analysts, however, the new resolution could potentially re-define the AUMF, give greater impetus and legitimacy in *actually* using force, and "broaden the purpose of military force to include unspecified U.S. national security interests" (Weed, "A New Authorization for Use of Military Force Against the Islamic State: Issues and Current Proposals in Brief," p. 6). In an apparent stretching of the theaters of conflict, there would be no geographic limitations on where the United States could take the fight. While Defense Secretary Ashton Carter described this inclusion as being "wise," given the indications that ISIS had the capability to expand outside of Iraq and Syria, it presented some concerns on where the use-of-force threshold would end up should the United States continue on a trajectory of adjustment (Brookings Institution, "President Obama's Authorization for Use of Military Force (AUMF) against the Islamic State"). Additionally, the definition of "associated persons or forces," particularly the addition of the phrase "fighting . . . on behalf of . . . ISIS," could be interpreted to be lacking in precision and, thereby, possibly lead to confusion in the projected assessments pertaining to what *actually* constitutes a lawfully targeted entity. Further, in contrast to the preceding AUMF proposals, the Obama 2015 version did not specify a purpose or objective for the use of US Armed Forces against the Islamic State in the authorization rhetoric itself. Again, this created concerns that the authorization did not sufficiently direct the president's actions or provide

a definition of victory and therefore "authorizes military operations without an endpoint or measurable goal" (Weed, "A New Authorization for Use of Military Force Against the Islamic State: Issues and Current Proposals in Brief," p. 6).

In attempting to find some semblance of balance, a variety of members of Congress put forward their legislative proposals for the new AUMF in the 113th and 114th Congresses, arguing that prevailing legislation authorizing military force is out of date and inadequate to address the Islamic State. Some articulated the view that a new authorization is essential to prevent the president from becoming embroiled into a large-scale, extended conflict similar to those in Afghanistan and Iraq. Conversely, others have argued that the existing 2001 and 2002 AUMFs, which approved the use of military force against Al and the Taliban after 9/11, and the incursion in Iraq, respectively, are now too inadequate in their scope and unnecessarily impede Obama's capacity to defeat terrorist and extremist threats to US national security and interests (John W. Rollins and Heidi M. Peters, "The Islamic State – Frequently Asked Questions: Threats, Global Implications, and U.S. Policy Responses," Congressional Research Service report, November 25, 2015, pp. 5–6). As stated by Lauren Weatherby, "Congress is clearly divided. Many Democrats and some Republicans fear a fresh AUMF would lead to wider and more extensive military involvement. But many Republicans, and some Democrats, fear an AUMF would be too limited – tying the president's hands in the fight against a significant new enemy" (Lauren Weatherby, "Whatever Happened To The Debate Over Use Of Force Against ISIS?" *NPR*, June 17, available at: http://www.npr.org/2015/06/17/415203016/whatever-happened-to-the-debate-over-use-of-force-against-isis). While the dichotomy is not directly related to the Obama administration, it is somewhat symbiotic of the congressional paralysis that has hindered his foreign policy approach – leaving many analysts to debate the extent to which Obama has induced these responses or been unfairly impacted by actions that are politically motivated.

## New Technologies and the Use of Force

Not surprisingly, the complexities surrounding the United States' doctrinal ambivalence – both forced and induced – and the way it proposes "new" interpretations of international legal standards governing its use of force may also lead to further global security issues as new technologies emerge. A particular technology to consider in this context is "lethal autonomous robots," also called "lethal autonomous weapon systems" (LAWS) and "fully autonomous weapon systems" (for a summary of the various definitions that have been used, see Fabian Wegmann, Autonomie unbemannter Waffensysteme. Das CCW-Expertentreffen zum Thema "Lethal Autonomous Weapons Systems" und der gegenwa¨rtige Stand der Technik, IFAR Working Paper (Hamburg: Institute for Peace Research and Security Policy at the University of Hamburg, June 2014), pp. 7–8). The term "human out of the loop" (terminology for a man or human "in the loop," "on the loop," and "out of the loop" is used widely in the field of robotics; *see* Nils Melzer, Human Rights Implications of the Usage of Drones and Unmanned Robots in Warfare. EU Document EXPO/B/DROI/2012/12, Brussels: Directorate-General for External Policies of the Union, Directorate B, Policy Department, May 2013, p. 6) has proven uncomfortable for some translators. No one quite knows what the robots of the future will look like or what actions they might be able to perform, but roboticists, soldiers, politicians, lawyers, and philosophers must ask some very complex and interdisciplinary questions regarding the future use of LAWS. Unlike drones, fully autonomous robots would make their own decisions and act independently from humans. As former UN High Commissioner for Human Rights, Navi Pillay, has said, "So called 'killer robots' – autonomous weapons systems that can select and hit a target without human intervention – are no longer science fiction, but a reality" (Navi Pillay, "A 20-20 Human Rights Vision Statement by the UN High Commissioner for Human Rights, Navi Pillay for Human Rights Day," Geneva: Office of the High Commissioner

for Human Rights, 10 May 2013). While international humanitarian law mandates that the use of violence must be proportional and circumvent indiscriminate damage and killings, the use of "killer robots" has engendered fears that they "will be unable to adequately assess proportionality and precision," that is, where discerning decisions of proportionality of force are needed to evaluate "dynamic environments" and "require highly qualitative and subjective knowledge – just the things that robots could lack" (Denise Garcia, "The Case Against Killer Robots. Why the United States Should Ban Them," *Foreign Affairs*, 10 May 2015). The question on how the United States will react to this new area is not very clear nor is how it will regulate such use or treat international law regulating such force (*see* Warren and Bode, "Altering the Playing Field," pp. 190–191).

For Shirley V. Scott, however, one thing is clear: US decision-makers *will never* consider "surrendering decision-making regarding the use-of-force" and will be even less likely to with the ambiguity deriving from lethal autonomous weapons. As she argues, it is deemed vital that the United States retain the freedom to use force when it perceives it as an interest to do so, "and for international law to evolve so as to prevent the United States using force should it wish to do so," it would be a severe "incursion on US legal security" (Shirley V. Scott, 'Looking Back to Anticipate the Future. International Law in the Era of the United States,' in Rowena Maguire, Bridget Lewis, and Charles Sampford (eds), *Shifting Global Powers and International Law*: *Challenges and Opportunities*, London: Routledge, 2013, p. 17). Existing armed unmanned aerial vehicles are the precursors to lethal autonomous robotics – devices that could choose targets without further human intervention once they are programmed and activated. While this may appear farfetched, the Pentagon is already planning for them "envisioning a gradual reduction by 2036 of the degree of human control over such unmanned weapons and systems, until humans are completely out of the loop. As technology continues to expand and as the human role moves from being "in the loop" of the decision-making process with such devices (making all the key calls) to "on the loop" of the decision-making process, where the role pertains to overseeing operations rather than actually directing, complexities and debate will continue to emerge as the human role moves ultimately to "out of the loop." In considering Scott's argument, it must be noted that in the use-of-force domain, the rise of new forms of technology and shifting security scenarios (e.g., ISIL) may see the United States further reinterpret the rules governing the use of force and continue to challenge the very regime of international law and international order that it played a defining role in creating after World War II.

## Conclusion

Upon receiving the Nobel Peace Prize in 2009, Obama stated that United States could not "insist that others follow the rules of the road if we refuse to follow them ourselves" and that "adhering to the standards strengthens those who do, and isolates and weakens those who don't" (Barack Obama, "Remarks by the President at the Acceptance of the Nobel Peace Prize," Washington D.C.: The White House, 10 December 2009). In examining the doctrinal transition between the Bush and Obama administrations and the extent to which both have legitimized the use of force in their efforts to thwart the threat of non-state actors, terrorism, and WMD proliferation, it is evident there has been greater continuities in the "treatment" of the "rules" rather than actual departures. Additionally, US policies after 9/11 have continued to be defined by long-standing contradictions and opacities that have engendered widespread analysis and new critical questions in international relations and international law discourse. While the dualism is not necessarily unexpected, the ubiquitous theme of uncertainty and inconsistency poses concerns on where this will actually leave the international legal regime and the broader global order should the United States continue with an approach that has deviated between stated intentions and tangible outcomes, what it conveys in the context of international rule

of law and what it actually is in certain scenarios, its promotion of the principle of sovereign equality and US exceptionalism, what it seems to think other states should do and what it does itself, US engagement at different points in time, and where it stands in regard to adhering to the principles on the use of force, to what it actually does.

As this chapter has articulated, the apparent contradictions, marked elements of continuity, ongoing dichotomies, and various departures that the Obama administration has undertaken in the context of the use of force are emblematic of Obama's overall doctrine. In what was deemed by many to be a marked contrast, President Barrack Obama was elected on a platform of change that included a departure from his predecessor in the foreign policy domain. While this transition in 2009 came with a much-touted reversal of his predecessor's policies, very little has *actually* changed when it comes to the doctrinal pillar pertaining to the use of military force. Given the destabilizing potential such interpretations of otherwise widely accepted use-of-force standards represent – particularly in the absence of an independent judicial system capable of enforcing international law – it is evident that the United States pursues "a general authorization of the use of force" (Kirsten Schmalenbach, 'The Right of Self-Defense and the War on Terrorism', *German Law Journal*, Vol. 3, No. 92002, p. 22) *for itself*, when *it* chooses to do so, rather than in pursuit of its general prohibition. Although Obama's policies in relation to the Arab Spring were cautious, he still, and unsurprisingly, reserved the right to use force unilaterally to defend US security interests and came remarkably close to doing just that after chemical weapons had been used in Syria in the summer of 2013. And notwithstanding the Obama Doctrine's greater reluctance toward using large-scale force, as illustrated by his administration's cautious policies toward the conflicts in Libya, Syria, and Syria/Iraq (in the context of ISIS), this has paradoxically led to an even greater reliance and an associated lower threshold for using force in the form of targeted killings through new technologies. Indeed, drones have clearly proven to be alluring for a president interested in keeping American troops out of harm's way, reducing the number of ground forces, and the precise, "dehumanizing" targeting qualities this form of warfare offers (James Traub, "U.S. Foreign Policy: What Does Obama Believe? United Nations University Conversations Series," Tokyo, 11 March 2015; compare also James Traub, "When Did Obama Give Up?" *Foreign Policy*, 26 February 2015, available at: http://foreignpolicy.com/2015/02/26/when-did-obama-give-up-speeches/). Overall, when appraising the broader Obama Doctrine and its ostensible penchant to adjust, comprise, and hedge, the use-of-force arm within the doctrine provides a case illustration.

G

## Globalization and World Trade Organization

Harry Blutstein
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

### Synonyms

Globalization; Rule of law; World Trade Organization

### Definition

The World Trade Organization is a key institution that applies the rule of law to international trade and had liberalized trade in goods, services, and created protections for intellectual property and foreign investment.

### Rule of Law

The World Trade Organization (WTO) is more than a supranational institution that supports the liberalization trade. It is built on a radical idea that has taken globalization to a new apogee of authority and ambition.

The WTO was the last major international body created, completing the institutional architecture that buttressed the rule of law, a key foundation of what we now call globalization (Blutstein 2016). For WTO's first director-general, Peter Sutherland, the WTO represented the "belated completion of the Bretton Woods structure of IMF, World Bank and the WTO," which he hoped would turn "words about a new world economic order into reality." The new global order was unique, he argued, because for the "first time a stable system was built on consensus, not on conquest, and on principles of equity and legality" (Sutherland 1994).

The WTO was created as part of the Uruguay Round of negotiations, which had been launched by the General Agreement on Tariffs and Trade (GATT) in Punta del Este in September 1986. These negotiations led to Marrakesh Agreement, signed on 15 April 1994, which created the WTO, as series of rules, administrative arrangements, and specific trade agreements, which included an enhanced GATT.

The WTO employs the rule of law to restrain governments from gaming the trading system and imposing economic harm on other countries. Its rules oil the wheels of global trade, reducing friction that in the past has led to trade wars in which there were no winners. Most importantly, GATT and its successor, the WTO, have contributed to postwar prosperity by opening markets.

Where the Marrakesh Agreement takes globalization into new territory is by including a groundbreaking mechanism to resolve disputes, with coercive powers that punish countries for breaking its rules.

## WTO Outlined

Trading rules are contained in a series of agreements and annexes that are designed to be updated, reflecting the mission of WTO to continue to liberalize trade.

The Marrakesh Agreement contained four major agreements. They are on goods (General Agreement on Trade and Tariffs or GATT) and include investment measures and antidumping measures, services (General Agreement on Trade in Services or GATS), intellectual property (Trade-Related Aspects of Intellectual Property Rights or TRIPS), and dispute settlement (Understanding on Rules and Procedures Governing the Settlement of Disputes or DSU). Finally, there are the detailed schedules of commitments made by individual countries in which they grant access to their markets for specific foreign products and services.

Central to implementation of the Marrakesh Agreement is its Article III, which sets out the primary functions of the WTO. It has executive functions that include "implementation, administration, and operation" of the trading framework and trade agreements. It has a legislative function in which the WTO provides a "forum for negotiations among its Members concerning their multilateral trade relations." And it an adjudicative function, in which the WTO administers the arbitration mechanisms contain in the DSU (WTO 1994a).

A core principle of the WTO is that each member should treat other members equally and that a concession offered to one trading partner is offered to all others (the Most Favored Nation principle). In addition, foreign business should be treated no less favorably than a domestic business (the National Treatment principle).

Most of the WTO obligations are prohibitory; they tell a country what it cannot do. Some obligations, however, are conditionally permissive; they tell a country what it can do if, but only if, the country meets certain prerequisites, such as its rules on when antidumping duties can be imposed.

One of the WTO agreements – Trade-Related Aspects of Intellectual Property Rights (TRIPS) – goes further. It required countries to meet minimum standards to protect intellectual property rights of private actors. Moreover, many countries, developing countries in the main, were forced to strengthen their legislative protections of intellectual property, creating international standards on the protection of intellectual property and even setting out the role of governments to enforcing those standards, prompting Govaere and Demaret (2001), to describe the TRIPs

agreement as an "exercise in global regulatory coercion."

The organization behind WTO is designed to be dynamic and continue to liberalize trade. This is driven by WTO's executive body: the Ministerial Conference. This body meets every 2 years and is responsible for reviewing policy and launching new trade rounds, aimed at expanding world trade.

Decisions, however, on agreements and rules are made by the General Council, with each country having a single vote. As of 29 July 2016, the WTO had 164 members, which has made decision-making much more difficult, particularly as the organization prefers to operate by consensus.

## Jewell in the Crown

WTO authority to impose the rule of law is contained in the DSU (WTO 1994b). It is left to states to initiate action when WTO rules are breached and they believe they have suffered a material loss. WTO provides independent trade tribunals to arbitrate disputes when conciliation fails. It also has a body to consider appeals.

The enforcement is unique by not directly issuing penalties, which could be seen as infringing a country's sovereignty. Instead, it allows the injured party to retaliate with WTO-sanctioned tariffs or other measures to recover its losses.

Former director-general, Pascal Lamy, heralded the dispute resolution mechanism as the "jewel in the crown of the WTO" (WTO 2009). Others agreed. "The first step towards the rule of law in international trade was the greatest achievement of the Uruguay Round," Nobel prize-winning economist, Joseph Stiglitz (2007, p, 76) added. "Without the rule of law, brute power wins." According to Peter Sutherland (1994): "effective multilateral rules and commitments are what stands between them [developing countries] and the law of the jungle."

For the first time, countries could use the DSU to address measures that unfairly limited their access to trade. Certainly, many developing countries appreciated the introduction of WTO's coercive dispute settlement mechanism, which was preferable to the law of the jungle by which major trading powers had savaged and cheated them.

Should conciliation fail, under the DSU, an aggrieved WTO member can bring a formal case against any other country that it believes breached WTO rules. Such disputes are heard by semi-judicial trade panels that adjudicate on the merits of each case. After hearing the case in private, the panel issues a report of its findings. If the panel believes that a member has violated an agreement, it usually recommends that the member withdraw the offending measure. If a panel's findings are not implemented then the Dispute Settlement Body will automatically authorize retaliation. As a safeguard, parties can appeal a panel ruling to a seven-member Standing Appellate Body within the WTO.

Where WTO declares a domestic measure – whether a law or policy – contrary to its rules, rather than directly requiring the measure to be withdrawn, WTO allows that injured party to legally launch retaliatory trade sanctions to recover damages. These damages continue until the offending measure is withdrawn, providing a strong incentive for a government to reverse the measure.

The DSU is designed so that the WTO cannot by accused of undermining democracy by forcing a government to change its legislation or policy. However, if a government chooses to continue with a measure that is declared illegal, it needs to be willing to pay for the privilege. Many have not, and instead have rescinded "illegal" measures.

Regardless of the nimbleness in which the DSU works around the problem of directly eroding a country's sovereignty, this has not stopped it being criticized for being antidemocratic and compromising a country's sovereignty (Barfield 2002). This has led Chayes and Chayes (1995) to argue that sovereignty needs to be redefined for an interdependent world. Other than a few self-contained nation-states, they posit that "sovereignty no longer consists in the freedom of states to act independently, in their perceived self-interest, but in membership in good standing in the regimes that make up the substance of

international life. To be a player, a state must submit to the pressures that international regulations impose.... Sovereignty, in the end, is status—the vindication of the state's existence as a member of the international system."

When it comes to trade in a globalized world, decisions by one country can harm the welfare of others. It may be a subsidy that lowers world prices for a commodity or an environmental, health, safety, or labor regulation that is designed to disadvantage foreign competitors or antidumping duties based on engineered data.

Only a supranational body with the necessary coercive powers can created legal remedies for injured parties. While the decision to adopt harmful trade policies may be legislated by a democratic government, if harm spills over into another country then the DSU provides a practical legal avenue to other countries to protect themselves.

There are plenty of examples of countries using their laws and policies as weapons to put importers at a disadvantage, and these have generated a high number of disputes.

This tactic was honed during the 1980s when countries became adapt at creating such regulations with the primary aim of excluding competitors from their markets rather than address real risks (Runge 1990).

To decide which regulations are genuine, dispute resolution tribunals look to two WTO agreements that are designed to ensure local rules are nondiscriminatory and do not create unnecessary obstacles to trade. One is the Sanitary and Phytosanitary Measures (SPS), which addresses food safety and animal and plant health measures. The other is the Technical Barriers to Trade (TBT), which addresses product testing and standards. The objectives of these agreements are to encourage countries to adopt international standards, guidelines, and assessment procedures, which are prepared by international standardizing bodies like the Codex Alimentarius and the International Standards Organization.

Whenever a country argues that there is no appropriate international standard to address a particular risk and that it needs to introduce a domestic law, it needs to produce hard evidence from risk assessments that backs its case, should a dispute arise.

While the DSU was an improvement on the law of the jungle, its design is flawed when, after a successful judgment, smaller economies try to use retaliatory measures. Magna Shahin (1996), who represented Egypt during the Uruguay Round, explained the problem faced by most developing countries. "China could [use it], but what about a country like Egypt or even a smaller one against the US, the EU or even Japan?"

This remark was made in 1996, and since then either developing countries have not bothered using it or when they do, find that it is ineffective.

There is no better example than the experience of Antigua and Barbuda. In 2007, it won a ruling over the USA on its prohibitions against offshore internet gambling. Its first problem was that the small Caribbean nation, with a population of around 90,000 people, had insufficient imports from the USA to recover $21 million per year, as per the WTO judgment. When it decided retaliate by suspending US intellectual property rights, which meant that they could sell to the world US patented and copyright products free of royalties, it found itself threatened by Nkenge Harmon, a spokeswoman for the US Trade Representative's office, who warned its government that such action "would serve as a major impediment to foreign investment in the Antiguan economy, particularly in high-tech industries" (Palmer 2013). Frustrated, on 25 April 2014, Antigua and Barbuda issued a statement that accused the dispute settlement mechanism of denying "the ability of small economies to obtain any meaningful recourse when wronged by others" (New and Saez 2014). Soon after this statement was released, the government accepted token compensation when the USA offered to establish a satellite visa office in the country and grant additional scholarships for the American University of Antigua (Stradbrooke 2014).

## One Cheer for the WTO

Not only does the DSU have its weaknesses, but the rules it enforces have their own biases and special deals that inhibit genuine free trade.

Economist Dani Rodrik (2002) pointed out that "[g]lobal economic rules are not written by

Platonic rulers, or their present-day pretenders, academic economists. If WTO agreements were truly about 'free trade,' as their opponents like to point out, a single sentence would suffice ('there shall be free trade')."

Evidence that the WTO did not deliver free trade is not hard to find. Within the final package of around 60 agreements, there are 560 pages of complex legalese and another 23,000 pages of codicils, many of which are special deals and exceptions that serve vested and national interests of the major trading powers.

As well as being winners of these special deals, there were also losers. Stiglitz (2007, p. 62) concluded that the Uruguay Round "left them [developing countries] worse off than they would be with a truly free and fair trade regime." In particular, developing countries received few concessions when it came to products in which they had a competitive advantage, particularly in the area of agriculture, steel, and textiles Lipson (1982).

During the Uruguay Round, while there were more participants than earlier GATT rounds, the major powers still dominated, with the USA, European Union, Canada, and Japan setting the agenda on tariff reductions, with powerful local producers putting their interests ahead of consumers. One example was how the antidumping section of the Marrakesh Agreement was shaped by the US steel manufacturers (Barringer and Pierce 2000).

> Big Steel . . . maintained inordinate influence over the U.S. government's bargaining positions in the Uruguay Round of multilateral trade negotiations and trade case administration by the Department of Commerce. . . .. Big Steel thus gains a substantial advantage in pressing its entreaties, at the expense of consumers' and taxpayers' broader interests.

In should come as no surprise that domestic lobbyists would try and shape the position of their country's trade negotiators. However, during the Uruguay Round, new players exerted considerable influence over the Final Act. In coordinated campaigns, transnational corporations in certain industries lobbied a number of Western governments for special deals that served their interests. According to Diana Tussie (2007), Director of the Latin American Trade Network, "trade rules have been dominated by behind-the-curtain global corporate interests."

One of the new agreements introduced during the Uruguay Round was TRIPS, which was not on the agenda when the round was launched in 1986, and it succeeded despite strong opposition from developing countries.

One of the lobbyists who spent some time working on TRIPS was James Enyart (1990) from Monsanto, who provided an insider's account of negotiations. "Changing foreign IP laws was viewed by many as impossible," he wrote. "It took a few fanatics in some big companies to take on the impossible." As well as Monsanto, lobbyists from the pharmaceutical, software, entertainment sectors, and other transnational companies with major investments in intellectual property participated in a campaign to have TRIPS included in final agreement.

In a chilling display of hubris, Enyart (1990) concluded that "the rules of international commerce are far too important to leave up to government bureaucrats and their academic advisors." Instead "[i]t's time for the people who actually make development happen to have an appropriate voice."

Rather than promoting free trade, experts have condemned TRIPS. Jagdish Bhagwati (2004), Sutherland's economics policy advisor, was scathing. "For virtually the first time, the corporate lobbies in pharmaceuticals and software had distorted and deformed an important multilateral institution, turning it away from its trade mission and rationale and transforming it into a royalty collection agency." By royalties, Bhagwati means that corporations use legislative monopolies provided by patents, trademarks, and copyrights to sell or license products at premium prices not set by the marketplace.

Former Chief Economist at the Asian Development Bank. Arvind Panagariya (1999) argued that TRIPs "promises to lower the welfare of not just developing countries but the world as a whole. As such, it is an efficiency reducing, redistributive exercise."

This was not the only example of a campaign launched by a network of transnational corporations working together. Another loose alliance of transnational corporations helped shape GATS,

which opens up new business opportunities for those corporations to operate primary welfare services such as health and education. There would also be opportunities to either own or operate water and sewerage works, banking, transport, and telecommunications around the world. Governments in developing countries, in particular, worried that GATS would pressure them to privatize essential services and limit their ability to provide affordable welfare and services to their people, particularly to the poor (Yen 2003).

## Loss of Faith in the Rule of Law

WTO was created on the premise that it would continue to drive the liberalization of trade, and it intended to launch a new round of negotiations during third Ministerial Meeting, held in Seattle between 30 November and 3 December 1999.

In the 5 years since the WTO's creation, there was a growing crescendo of complaints with the existing agreements. These manifest themselves in a series of demonstrations, the largest being large scale protests in Seattle, with 40,000 people on the streets. For all the noise and fury, the movement lacked coherence. There were those who wanted to reform the WTO by making it more democratic. Others wanted the WTO to do more to promote public welfare and protect the environment. And some protesters attacked the WTO for treating developing countries unfairly. There was also a strong theme running through many of the critiques coming out of Seattle: that transnational corporations had captured the WTO.

The protesters blockaded the venue where the ministers were meeting and WTO had little choice but to call off its meeting. This meant that its main agenda item – launching a new trade round – was postponed.

The next Ministerial Meeting was held in Doha, between 9 and13 November 2001. It was an astute choice. As the host, Qatar was both remote from the main centers of protest and its government made sure that foreign demonstrators did not entered the country.

For all the concessions they yielded during the Uruguay Round, the least developed countries were led to believe that the next round of negotiations would be more to their liking. It was not, as a report from the Third World Network (2001) explained:

> At the conclusion of the Uruguay Round, developing countries fully expected that in return for agreeing to expand the mandate of the GATT system to areas such as intellectual property rights and services (in which they were expected to make obligations without getting reciprocal gains) they would benefit significantly from increased access to developed countries" markets, especially in agriculture, textiles and clothing. However, since the WTO came into being, these benefits have mostly not been forthcoming, while traditional problems such as low commodity prices and declining terms of trade continue to plague developing countries" trade performance. Developing countries also complain that developed countries still apply non-tariff barriers to their products, such as anti-dumping measures. This lack of benefit from the trade system has led to a growing disillusionment among policymakers and the wider public in many developing countries.

A particular area of friction is over agricultural subsidies. The Agreement on Agriculture, part of the Marrakesh treaty, capped agricultural subsidies at their 1994 level. Moreover, WTO members committed to gradually reduce them. This provision legitimized high subsidies in place in the USA and European Union. On the other hand, developing countries had no or few subsidies in place when this agreement took effect and were unable to introduce new subsidies so that they could compete on a level playing field. Moreover, International Monetary Fund and the World Bank loans contained conditions that required recipients, developing countries in the main, to reduce the few agricultural subsidies they had in place.

At the same time as the cap has been applied to developing countries, using sleight of hand, the European Union and USA increased their effective level of protection by an estimated 61% and 44%, respectively, through nontariff barriers (Scott and Wilkinson 2011).

Stiglitz and Charlton (2005) analyzed the agenda of the Doha Round. They concluded that "[t]he round of trade negotiations that began in Doha does not yet deserve the epithet of a "Development Round". Indeed once again, as in the past, the agenda for the new round reflected the

interests of the advanced industrial countries. The new issues that have been added to the agenda are not priorities for developing countries; indeed some of their provisions would have actually been harmful to them." Their report also found that measures to further liberalize GATS and expand TRIPS would inflict further injury the interests of developing countries.

Developing countries tried to include items they wanted to pursue on the Doha agenda, such as agriculture and textiles, but were filibustered by the USA, Japan, and the European Union.

The next Ministerial Conference was in Cancun, Mexico, from 10 to 14 September 2003. With little progress made on their issues, the chasm between developed and developing countries widened and the Doha was left on life support.

Any chances of developed countries softening their position ended with the global financial crisis. With their economies significantly weakened, developing countries increased protection. Since 2009, G20 countries have imposed 1583 trade restrictive measures, and while a quarter of these have been withdrawn by 2016, and those remaining still affected over 6% of all G20 imports and 5% of global imports (WTO 2016).

Despite this spurt of protectionism, the USA and European Union continued to pay lip service to Doha. At the same time, they quietly transferred most of their energy into two mega-regional trade agreements, where they could have greater control over the agenda. One of these trade agreements is the Transatlantic Trade and Investment Partnership (TTIP) between European Union and the United States. The other was the Trans-Pacific Partnership Agreement (TPP), a 12-country grouping led by the USA and Japan.

Whether by design or otherwise, the countries involved in negotiating these agreements do not include the so-called the BRICS: Brazil, Russia, India, China, and South Africa. This opened the way for major developed countries, particularly the USA, the European Union, and Japan, to set standards for world trade without the bother of having to compromise with the larger developing countries who could challenge them.

According to Indian trade expert, Geethanjali Nataraj (2015), once these agreements have been finalized, "third world countries will presumably be compelled to adapt to their standards and regulations."

Even these mega-regional agreements are now in doubt with the rise of populism, with the USA withdrawing from the TPP. At the same time, the TTIP faced noisy opposition in Germany, Austria, Luxembourg, France, and Italy. While the USA has not withdrawn from the TPP, its language has changed to one that sounds very much like mercantilism. This agreement is no longer "trade liberalization," according to Wilbur Ross, US commerce secretary, but about "correcting" trade "imbalances" (Donnan and Beesley 2017), presumably in the favor of the USA.

As a toxic brew of populism, mercantilism and crude protectionism are bubbling away, the *Wall Street Journal* (Bacchus 2017) warned that these forces "would unleash weapons of mass economic destruction world-wide."

If the rule of law is eroded, and the institutions that buttress it endangered, then the law of the jungle might well result in economic warfare. And history has shown that economic warfare can easily descend into open warfare. It was the experiences of engineered currency devaluations and erection of tariff walls in the 1930s that helped contribute to the Second World War (Førland 1993).

## Globalization of Health and Human Rights

Maithri Goonetilleke[1] and Paul A. Komesaroff[2]
[1]Monash University, Clayton, VIC, Australia
[2]Centre for Ethics in Medicine and Society, Monash University, Caulfield East, VIC, Australia

The progressive extension of both the concept and application of human rights over the last 70 years has opened up new possibilities for opposition to

oppressive political regimes, the defense of individual freedom, and the broadening of personal opportunities for people around the world. Of particular importance has been increased support for the provision of the basic constituents of health and health care for both individuals and communities.

Accompanying the extended reach of human rights discourses has been the globalization of capital and culture, which has generated unprecedented international movements of money, people, and information. These social, economic, and cultural interactions have themselves produced a variety of effects on both health and human rights. On the one hand, increased wealth and better communication have led to significant improvements in health status and human rights in many settings. On the other hand, the pervasive infiltration of neoliberal principles and practices has increased inequalities, eroded public support for health care, and challenged traditional systems of value and care.

## Human Rights: Conceptual Constraints

Despite the common assumption that the understanding of human rights has advanced seamlessly and triumphantly since the end of the Second World War (Howard-Hassmann 2010), the reality is in fact that the achievements have been relatively modest. Indeed, over this period major deficiencies have emerged in both the conceptual and practical domains. The concept of "human rights" itself has been shown to be flawed, as has its links to practical systems of implementation, which have sometimes been found to generate paradoxical outcomes. The abstractness of the claims has often meant that they have lacked substantive content, and the supposed universality – central to the core idea of human rights – has limited their ability to reflect local cultural variation.

Further, human rights discourses usually attribute the key agency in defending and implementing the supposed entitlements to the nation-state, with rights violations being construed as a political failure by a state to honor its obligations to its citizens. In a globalized world, however, the policies and actions of states are commonly the outcomes of complex networks of relationships and interests involving government and nongovernment stakeholders across a wide geographical areas (Chapman 2016). Human bodies have been subjected to the pressures of globalization almost as much as have markets, highlighting the fundamental role in ill health and disease of structural as well as biological factors.

## The Role of Human Rights Agreements in a Globalized World

Immediately following World War II, several charters, including the Universal Declaration of Human Rights (UDHR), were created to proclaim the inherent, fundamental, inalienable rights of all human beings. For their boldness, vision, and humanity, these documents have been extravagantly praised, as "a family of post World War II rights instruments that attempted to graft social justice onto the tree of liberty" (Glendon 1997). In spite of this, in the decades since their enunciation, the inherent difficulty of upholding these rights across the globe, including of introducing changes to actually enhance the health of citizens, has become increasingly apparent. In response to these difficulties, the critics have been less generous, describing the UDHR variously as merely "a collection of pious phrases" or, as the former United States' UN ambassador Jeane Kirkpatrick put it, no more than "a letter to Santa Clause" (Kirkpatrick 1981).

The highly contested evaluations of formal human rights agreements are mirrored in debates about the nature and effects of the great variety of movements for change across the world. The complex social transformations associated with globalization cannot be characterized by any single theoretical formulation. Rather, the forces are multiple and variable. For example, as Richard Falk has argued, globalization processes can be simultaneously both "top down" and "bottom up" (Falk 1999). Bottom-up processes are those "directed by people, based on equality, and motivated by cooperation," while top-down processes

are "directed by capital/markets, powerful states, and corporate media, based on inequality and motivated by competition." But even classifications such as this can be difficult: despite the attractiveness of binary distinctions, they risk excessive simplism as the boundaries between capital and labor, state and civil society, and competition and cooperation, and the realms of the individual and the social become increasingly blurred over time. What is more, even the distinction between "local" and "global" has now become uncertain, as bottom-up movements increasingly make use of cyber connectivity, social media, and other information technologies to bolster their causes. In an era of mass, instant dissemination of information, the capacity has grown for sudden, unpredictable effects – both harmful and beneficial – on struggles for rights and social change.

The expansion of global economic capacity has generated the possibility – and in some cases the reality – of moving substantial groups of people out of extreme poverty. While this has generally been interpreted in favorable terms, on occasions it has been falsely assumed that improvements in economic well-being lead inevitably to the enhancement of human rights. This is in fact not at all the case. In reality, the conditions of increased economic wealth have often resulted in increased exploitation, especially among poor laborers. In Bangladesh, for example, over the last 30 years, increasing international demand has led to a continuing, rapid expansion of garment factories, which has in turn generated employment for millions of workers, 80% of whom are women (Rahman and Siddiqui 2015). However, female Bangladeshi factory workers are commonly cruelly exploited, not only in terms of almost starvation wages but also lack of union and collective bargaining rights, absence of maternity and sick leave rights, and widespread verbal and physical abuse in the workplace.

An extreme example of the suffering produced by the apparent beneficent process of economic development is provided by the collapse, on April 24, 2013, of the Rana Plaza, an eight-story building in Savar, Bangladesh. The structure had housed six garment factories which produced apparel for international labels such as Benetton, Bon Marche, Primark, and Walmart, as well as a bank and shops. The previous day, government authorities had been made aware of profound structural faults in the building infrastructure and had closed the bank and shops. However, the garment workers had been forced to return to work and threatened with loss of income if they did not do so. The next morning the entire complex collapsed, killing 1129 garment workers (Akhter 2014). The Asia director of Human Rights Watch lamented that the tragedy had been "predictable" because many other deaths had already occurred over the preceding decade in Bangladeshi garment factories owing to inadequate attention to safety standards. He also pointed out that, perhaps intensifying the injustice, in this and similar cases, the responsibility for the violations of human rights is often placed on under-resourced labor inspection departments and officials, with minimal consequences for the multinational fashion conglomerates which continue to reap immense profits from their subcontracted factory workers.

## Health as a Human Right

The 25th article of the UDHR proclaims a "right to a standard of living adequate for the health and well-being of [a person and his or her] family, including food, clothing, housing and medical care and necessary social services." A similar commitment is echoed in the constitution of the World Health Organization, written 2 years prior, in 1946, which declared that all people have a right to the "enjoyment of the highest attainable standard of health." In the preamble to the same document, WHO had adopted its famous "holistic" definition of health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." Partly in response to the latter formulation, broad understandings of health as dynamic, nonlinear, and incorporating a recognition of the intimate interconnection between biological disturbances and environmental and sociopolitical conditions have

now been adopted by public health institutions around the world (Chapman 2016).

Despite the expansive aspirations and the apparent enhanced recognition of the complexity of the tasks associated with health and health care, the achievement of global health outcomes is in many cases even more elusive than ever. As previously, this reflects both conceptual and practical impediments. While the hypothesis that health is intricately linked to social variables is a powerful one, simplistic theories that assume linear, causal relationships between individual "social determinants" and biological outcomes fail to accommodate the multidimensional complexity that characterizes the actual operation of cultural and biological systems. In addition, larger structural processes in which such determinants may be imbedded, such as the neoliberal forces driving globalization and the avoidance of mechanisms to ensure effective surveillance in relation to social and ethical values, are generally ignored altogether. At the practical level, upholding a "right to health" cannot be achieved without concurrent action to realize a wide range of other rights and freedoms and to implement the social changes necessary to ensure access to clean water, adequate housing, transport and education, effective sanitation, a clean and unpolluted environment, and safe working conditions.

## Historical Globalization and Health

Despite the greatly increased recent awareness of it, globalization is not a new phenomenon. Historically, human health and well-being have been heavily influenced by interactions across national borders. Communicable diseases were often transmitted along trade routes. A well-studied example of this was the rapid, uncontrolled cross continental spread of bubonic plague by rats which accompanied the expanded reach of land and sea merchants in the sixteenth and seventeenth centuries (Cohen and Kennedy 2012). When the historical record is examined from the vantage point of the broad biopsychosocial understanding of health that is currently promoted by the WHO and the global public health establishment, however, far more pervasive health effects of globalization over the centuries are revealed. Between the sixteenth century and the late twentieth century, European colonization of Africa, Asia, Oceania, and the Americas facilitated not only the transmission of epidemic diseases to immunologically naive indigenous peoples but also a wide range of adverse biological, psychological, and social consequences that stemmed from the systematic dismantling of freedoms it brought with it. Among these consequences were the theft of arable lands, which had provided sustainable nutrition, water, safe housing, and a healthy environment – in some cases, such as Australia, for thousands of years – and frontier violence and physical, psychological, and sexual abuse associated with slavery and segregation.

The process was briefly interrupted during the 1960s, in response to the postwar process of decolonization and reconstruction, and over the next several decades, health indicators improved in many settings, largely driven by widespread and far-reaching improvements in education, sanitation, and water access. However, the improvements were disproportionately distributed and in some cases short-lived. The fastest growth in measures of health status and indicators such as life expectancy and infant mortality occurred in the developed world, increasing the discrepancy between rich and poor countries; the flourishing of dictatorships in Latin America and Africa – many of them sponsored by the developed countries – prevented any major redistribution of wealth; and new epidemics and environmental factors, such as HIV and droughts and famines in the Horn of Africa, overcame many of the gains that had been made.

## Contemporary Globalization and Improvements in Health

Over the past three decades, what is known as the "contemporary period of globalization," sometimes referred to as "the great acceleration" (McMichael 2013) or "hyper-globalization," has been characterized by a rapid intensification of

transnational interactions and exchanges in the areas of economy, culture, and population. Drawing on vast data sets from over 120 countries, economist and inequality scholar Branko Milanovic demonstrated an exacerbation of national economic differences between the late 1980s and 2008 (Milanovic 2016). His findings identified two groups which had benefited most conspicuously from this accelerated process of globalization. The first comprised a large population in countries such as India, China, and Brazil which had emerged as a new global middle class. The second was the "global elite," the members of which were able to preserve their historical status as the prime beneficiaries of transnational capital flows.

The upward economic mobility of large segments of populations within countries such as China and, more recently, India has contributed to widespread and genuine improvements in global health status. Indeed, the relationship between poverty and poor health outcomes has long been established. In addition to millions being brought out of extreme poverty over the last three decades – in the case of China, as a result of socialist economic development and of India of traditional capitalist accumulation – global health projects have made important and enduring contributions. The latter have included large-scale vaccination programs against smallpox, polio, measles, and other infections, medications for HIV and malaria, and enhancement of access to routine health care within national and regional contexts. These have resulted in significant improvements in many indicators of global health status. In particular, across all regions, life expectancy has improved; the under-five child mortality rate has dropped by almost half from 1990 to 2013 (11.6–6.3 million deaths); and maternal mortality has decreased by about a third over a similar period (359,000 in 1990 to 255,0000 in 2010) (Zimmerman et al. 2016). Closely linked to these crucial advances, there has been a rapid and enduring enhancement in data collection and the efficiency of communication of health information, contributing to significantly improved capacity to respond both to humanitarian disasters and to the threat of novel international epidemic crises.

## The Impact of the Pharmaceutical Industry (Howard-Hassmann, 2010): HIV Therapy

Despite these undoubted improvements, however, the health needs of many populations, particularly those in very low development settings, have often also been severely limited by the operations of the global economy. While this may at first sight seem paradoxical, it is in fact a natural and unexceptional result of the normal operation of international markets generally. It is also a well-recognized consequence of the conventional regimes of foreign and humanitarian aid which, contrary to their stated intentions, have often actually undermined development, intensified dependency, increased corruption, and exacerbated the disenfranchisement of poor and marginalized groups (Moyo 2009; Easterly and Easterly 2006). More specifically still, the established institutions of health and health care – including the production and distribution of medicines and other technologies – have often imposed major structural barriers to the improvement of the living conditions of the people most in need.

A particularly egregious example illustrates the potential influence of the pharmaceutical on global health. It is well known that this industry constitutes collectively the largest capital enterprise in the world, with several mega-companies monopolizing the development, manufacture, and distribution of all kinds of medications, including those applied in established, essential use and innovative, novel preparations. A recent challenge has come from the globalization of chemical technologies, which has allowed mass production of generic medications in a manner that could provide affordable medications to large populations. The resulting tension between a flourishing neoliberal pharmaceutical agenda and the determination of certain nations to make cheap generic medications has exerted significant impact on the global health conditions, especially in poor nations. In 1996 the World Trade Organization concluded a multilateral trade agreement on intellectual property known as the "Trade-Related Aspects of Intellectual Property Rights Agreement" ("TRIPS") (Farmer et al. 2013),

which guaranteed a 20-year period of patent protections for new technologies, including pharmaceuticals. A significant part of the rationale behind such patent protection was to generate incentives to support innovation and research and development of new technologies. Patenting of pharmacotherapies, however, also means increased costs to consumers, which for some populations dangerously limits access to life-saving medicines.

At the height of the HIV epidemic, in the mid- to late 1990s, a number of novel antiretroviral medications were invented which revolutionized therapy, to the extent that it was now possible to save millions of lives. Near the turn of the century, as a consequence of patenting laws such as the TRIPS agreement, the cost of supplying a combination of three antiretroviral medications was estimated between USD 10,000 and USD 15,000 per annum. For the vast majority of patients living with HIV across the globe, especially sub-Saharan Africa which has continuously recorded the highest prevalence of the virus, the costs of treatment represented an insurmountable obstacle. In 1997, the South African government responded to the crisis by importing generic antiretroviral medications from India and Brazil, an intervention which created competition and thereby drove prices down dramatically. In 1998 39 multinational pharmaceutical companies instigated litigation against the South African government for violation of intellectual property rights, and the United States placed the South African government on a "priority watch list," a precursor to trade sanctions. These and similar actions generated a wave of global activism and awareness campaigns, which in 2001 led to a compromise agreement referred to as the "DOHA Declaration," which affirmed aspects of the TRIPS agreement but also allowed countries in a state of national emergency to apply for a "compulsory license." This arrangement allowed alternative producers to manufacture items in their own country, which in a pharmaceutical context referred to the production of bioequivalent generic medications. Compulsory licensing, however, required that countries had the domestic technological and fiscal capacity for such mass production to occur – which was, of course, often not the case in the very places where the need for new medications was most urgent. It was not until the "General Council Decision" made by the WTO in 2003 (and confirmed in 2005, but not permanently accepted until 2017) that compulsory licenses ordered by low-income countries could be used to produce and import medications from other countries. Over the many years during which these multilateral trade and intellectual property agreements were being negotiated, untreated HIV ravaged sub-Saharan Africa and other areas of the developing world, resulting in unprecedented – and preventable – loss of human life (Hickel 2012).

G

## The Impact of the Pharmaceutical Industry (Chapman, 2016): Research and Development

The pressure on multinational pharmaceutical companies to maximize profits – an elementary and natural aspect of the capitalist economy – has generated a distinct geographic bias in relation to decisions about which diseases are selected for research and development of novel therapies. The World Health Organization lists 17 neglected tropical diseases (NTDs) which together affect over one billion people and account for hundreds of thousands of deaths each year, while costing the economies of developing countries billions of dollars. As a result of market pressures, between 1975 and 1999, no more than 1% of new drugs worldwide were designed specifically for NTDs. Even following significant global awareness campaigns from 2004 to 2014, this number increased only marginally to 4%.

The human consequences of the structural biases imposed on global health outcomes by this aspect of the operation of world capital can be illustrated by further examples. A neglected disease such as schistosomiasis, which is caused by a parasitic flatworm found in contaminated water sources, affects 210 million people worldwide and can cause permanent kidney, liver, and neurological damage. Like many NTDs, schistosomiasis has only one main pharmacological treatment. The lack of research and development

has generated a widely recognized risk that drug-resistant forms of the disease will emerge. The disastrous consequences of drug resistance are already being experienced in relation to other diseases such as tuberculosis, of which extremely virulent multidrug-resistant (MDR) and extremely drug-resistant (XDR) strains are already widespread. The development of novel, treatment-resistant forms of schistosomiasis and other diseases is an imminent, potentially catastrophic, danger.

Another example of skewed priorities systematically generated by the normal functioning of the neoliberal health agenda is the current shortage of snake antivenom in sub-Saharan Africa, where every year an estimated 30,000 deaths and 8000 amputations occur as a result of snakebite. For several years a Sanofi Pasteur antivenom named "Fav-Afrique" has been the best available product, providing a wide coverage of African snakes with relatively few side effects. Owing to poor capital yields, however, production of Fav-Afrique has recently been discontinued, with the last batch of the antivenom having expired in June 2016. It is estimated that a replacement generic product will take at least 2 years to appear on the market, during which time it is expected that both mortality and morbidity from snakebite in sub-Saharan Africa will have drastically – and unnecessarily – increased (Chippaux et al. 2015).

While globalization has generated inequitable patterns of medical innovation, the possibility should also be recognized that, if handled properly, forces within it could be mobilized to stimulate improvements in pharmaceutical research and development. "Open innovation models" offer the possibility of enhancing capacity by sharing aspects of research and development among diverse entities, instead of maintaining them, from inception to market, within closed, internal company processes. An example of a success already achieved using this model can be found in the area of antimalarial therapy. Amyris, a biotechnology company at Berkeley University laboratories in California, stimulated certain bacteria to excrete the chemical compound artemisinin, which is used in antimalarial therapy in developing world settings, and the Gates Foundation, a non-state actor, both funded production of the drug at Amyris and connected the company with Sanofi International for distribution (Chesbrough and Euchner 2011). This example illustrates how rather modest changes to global economic practice, if harnessed appropriately, can help reduce health inequities through enhanced efficiency of drug research and sharing of diverse capacities to support development of therapies for neglected diseases.

## Noncommunicable Diseases

The neoliberal organization of global trade practices has supported the widespread dissemination of many commodities that actively impair health, such as highly processed foods and drink with low nutritional value and addictive, harmful substances, such as tobacco. It is well recognized, largely from the experience of developed countries, that consumption of such products is closely linked to increasing rates of noncommunicable diseases, such as cardiovascular disease, obesity, diabetes, stroke, and lung cancer. For some time the burden of these conditions has been shifting from wealthy to poorer countries, and it is already the case that 80% of deaths in the world from chronic, noninfectious diseases occur in low- and middle-income settings. It is likely that, under continuing pressure from the globalized economy, their incidence will continue to rise.

Tobacco use is a particular area of concern. Expensive, large-scale public health campaigns in many developed countries over the last two decades have led to modest reductions in tobacco consumption. These campaigns combined legislative, marketing, and advertising strategies, along with various public health policy initiatives, and have been shown to have led to significant improvements in health outcomes. In response to the success of these programs, tobacco companies have now shifted their focus to developing countries, where both health legislation and awareness of the dangers of tobacco smoking are more limited. Because between 70% and 80% of the world's one billion smokers currently live in

developing countries, this has already produced a geographic shift in disease burden.

In 2005 WHO initiated an international treaty called the "Framework Convention on Tobacco Control" (FCTC), which encouraged increased attention on tobacco taxation, advertising restrictions and health promotion material on packaging and public policy modifications to limit passive smoking (World Health Organization 2009). However, countries that have sought to implement these measures have faced a vigorous backlash from multinational tobacco corporations, which have used bilateral investment treaties to oppose reductions in their capital flows from national smoking regulations. In 2010, Uruguay faced court action from tobacco corporation Philip Morris for seeking to require graphic warning labels on cigarette packaging. Philip Morris used its links to Switzerland to suggest that Uruguay had breached bilateral trade agreements. Similar cases were launched against the governments of Canada and Australia for health regulations which transnational tobacco companies argued violated bilateral investment treaties (Ottersen et al. 2011).

## Trade Liberalization and Food Insecurity

The majority of people living on less than USD1.25 per day populate rural areas of low-income nations and subsist on agriculture. In the 1980s, the same wave of neoliberal economic pressures described above generated a widespread privatization and deregulation of the agricultural sectors of many developing countries, often facilitated by Bretton Woods Institutions in the name of leveraging foreign debt. The deregulation policy rapidly reduced tariffs and subsidies on imports, allowing wealthy nations to sell surplus agricultural produce to poor countries. For the latter, this has displaced local food markets, along with many other effects. As a result the poverty and food insecurity of their citizens have been significantly intensified (Ottersen et al. 2011).

The impact of intensified trade and industrialization upon global climate patterns also threatens the food security of populations. Droughts jeopardize regional agriculture, while marine food sources are diminished by acidification and increased temperature of marine environments, ultimately posing significant threats to child and adult nutrition. Other environmental changes affecting food supply are also intensified by human industry such as water shortages, changes in soil fertility, nitrogen balance, and altered pest-pollinator ratios.

## Globalization, Climate Change, and Human Health

The impact of international commerce and trade upon the earth system cannot be overstated. The current geological epoch known as the Anthropocene period is understood as the time when human activity has been the predominant influence upon climate and the environment (McMichael 2013). Climate change engenders various risks to human health, including intensified and more frequent climate events such as droughts, floods, and fires; increased air pollution, leading to respiratory illness; water shortages, leading to reduced drinking water and sanitation and infectious disease; and the previously mentioned threats to global food security.

An intense heat wave accompanied by wildfires which Russia endured in the summer of 2010 precipitated a reduction of one third in the nation's wheat production. This event had international consequences, with the government banning export of wheat products, thereby increasing the global price of wheat and exacerbating food shortages both in Russia itself and in low-income countries such as Pakistan and Egypt (McMichael 2013).

As temperatures, humidity, and rainfall increase in certain regions, numbers of disease-bearing mosquitos increase causing concomitant rises in the prevalence of various diseases, such as malaria, dengue fever, and Zika virus. Furthermore, increased human travel leads to infiltration of mosquitos carrying a particular disease to previously disease-naive areas. Researchers have suggested, for instance, that Zika virus arrived in

Brazil in 2014 from French Polynesia during a world sporting event (Musso 2015).

## Toward an Ethical Globalization

The large-scale transnational transactions associated with the globalized economy, and the culture accompanying it, have generated considerable wealth but have also increased poverty, dependence, and inequality. Narratives favoring both human rights and global health have helped raise awareness of the extent and complexity of the tasks of enhancing health and health care and in some cases have provided support for actual practical initiatives.

The successes have been impressive: millions of people have been able to move out of poverty, and in certain regions, enhanced exchanges of information and technologies have led to large-scale, tangible improvements in health. At the same time, however, in many other regions, the problems have only been exacerbated. The rift between rich and poor has widened, access to medicines has decreased, food security has been threatened, the incidence of noncommunicable diseases has increased, and dependency and corruption have intensified. Global climate change has also emerged as one of the most pernicious by-products of globalization, and its potential health effects are vast.

The universalization of rights in the form of treaties and multilateral agreements provides civil society instruments and information to challenge state apparatuses which endanger basic individual freedoms. However, implicit in any universalization of values is an ethnocentrism which could potentially limit the space for appreciation and respect for diverse cultural understandings and behaviors. Furthermore international trade agreements can move power away from the governments and citizenry of low-income countries toward multinational conglomerates.

Paradoxically, exactly as it advances the recognition of the importance of both health and human rights, globalization also engenders the very opposite. Recognition of the intricate, dynamic relationships between the forces that affect health, human rights, and accompanying social and cultural effects may facilitate an improved understanding of the paradox, but they do not actively generate a solution.

The critiques of "globalization," "human rights," "health," and "health care" suggest the need for more complex formulations that can respect and preserve the richness and variety of local experience, the creativity of community, and the plurality of values and meaning-creating discourses relating both to ethics and health care. While the old "consensus" view was not complete without beneficial effect, a more contemporary appreciation of this heterogeneity may open the way for novel strategies to address the barriers to effective health care and to support civil liberties and human dignity.

## Synonyms

Fiscal administration; The act of managing budget processes in the public and nonprofit sectors

## Introduction

Around the world, demand for greater transparency in government activities has taken root and blossomed. One hot button, in particular, has become a focal point of discussion in recent years: public budgets. Democratic systems across the globe are faced with the dilemma of making fiscal administration more transparent to the public, and one tool that many local governments, in particular, have found successful is participatory budgeting.

Participatory budgeting (PB) is gaining traction worldwide as a best practice toward the goal of greater accountability in government, as it offers the public sector an opportunity to engage constituents in the budget process. Increasing pressure on democratic governments to be more transparent in their dealings begs the question: If government is a public good, then should not it involve the public? Lerner (2011, p. 35) explains that among its many strong points, "Perhaps most important, PB can help establish government as a valuable public good – an idea that is very much under attack."

## Responsiveness Through Participatory Budgeting

In an age when citizens feel that government is unresponsive to their needs, PB offers an alternative to local governments by welcoming input from constituents within the community. Beginning with a discussion of the democratization of the public sphere and demands around the globe for citizens' voices to be better heard in government, this entry will offer an overview of participatory budgeting and its contribution to the overarching objective of public sector transparency.

## Democratization of the Public Sphere

Although definitions of PB are as varied as the governments implementing the practice, in a nutshell, "[PB] allows the participation of non-elected citizens in the conception and/or allocation of public finances" (Sintomer et al. 2012, p. 2). Furthermore, "PB concerns the right to be heard in politics" (Ganuza et al. 2014, p. 2275). It is not enough to simply invite public feedback, if that input is not recorded or seriously considered. PB stems from the democratic process at its core.

Citizen participation dates back to the days of direct democracy in ancient Athens, but the modern iteration of participatory budgeting became rooted in Brazil in the late 1980s. It has primarily focused on municipal governments, based on the sheer numbers involved in gleaning public input. PB is a close cousin to direct democracy, which

seems to work best in relatively small populations. The practice took off in Brazil and has since spread around the globe, with hotbeds of activity currently concentrated in Latin America, Europe, Asia, and Africa.

PB has been credited with increasing democratic principles in areas where the practice has been executed. "The globalization of [participatory budgeting] may have a lot to do with this democratization of public space and, although the experiment's procedures may vary greatly according to context, PB almost always involves a deepening of democracy in terms of local political history" (Ganuza et al. 2014, p. 2275). After all, a government that exists for the people, by the people, should experience a deepening of those principles when the people are actually engaged in the workings of the government. Furthermore, PB provides a forum to increase legitimacy and offer fresh perspectives in the public decision-making process through its inclusion of everyday citizens. "Non-organized individuals would bring non-strategic knowledge, a practical knowledge that could endow politics with common sense or, at least, distance it from sectarianism" (p. 2281). Imagine a budgetary process that invites fresh ideas and novel approaches to problem-solving: that is PB.

PB also presents a new framework for public discourse. Old models delegated decision-making to associations and elected officials to coordinate on behalf of citizens, but PB invites input from the citizenry directly. "The problem has been the democratization of the public sphere, because in the new institutional framework associations have to share their voice. If associations used to be the actors that structured informal public opinion, PB offers a new way of structuring public opinion where citizens are directly invited to get involved in public decisions. This relation between the associations and PB conceals a friction with important consequences for the democratic life of cities, as it presents itself as a battle for representation of the citizenry's voice" (Ganuza et al. 2014, p. 2276). In other words, when citizens have the opportunity to speak for themselves as unaffiliated individuals, the power of associations that may or may not have been working toward the citizens' best interests is diminished. This is not to say that the voice of associations would be no longer welcomed; rather, organizations must work alongside individuals toward common goals and objectives concerning the public budget. Although citizens used to have to delegate their wishes to incorporated powers, PB offers a platform for individual voices to make their priorities known.

This shift in power dynamics within a civil society sparks a new way of engaging the public. "The clashing positions of politicians, citizens and associations thus present us with two extremes, which we can view as an opposition between deliberative and representative democracy" (Ganuza et al. 2014, p. 2288). As aforementioned, the onus for decision-making falls on associations in representative models; whereas, deliberative democratic models make it feasible for new participants to engage in the political process. PB fosters an environment conducive debate in the public sphere, which bolsters societal relations. "These new political practices apparently have much to do with the sorts of relations that have historically been attributed to civil society (for example, horizontal power relations, dialogue and tolerance)" (p. 2276). Those citizens who may feel that government was on an opposing side now have an opportunity to join the debate as individuals, thereby disbursing the decision-making power within the community.

Deliberative democracy lends itself naturally to improved dialogue among participants, as they become more involved in the decision-making process. In turn, neighbors can develop tolerance toward new ideas and each other. For example, Chicago, Illinois, served as the first testing ground for PB in the United States, and despite some challenges along the way, ". . . the Chicago experiment illustrated ways to bring people together to make tough decisions. Sure, residents had conflicting ideas about how the money should be spent, But now they had space to negotiate these differences and focus on the common good" (Lerner 2011, p. 35). Diverse voices contributed to the success of PB in Chicago, rather than detracted from the process.

PB offers six core benefits, according to Lerner (2011): democracy, transparency, education, efficiency, social justice, and community (p. 31). As mentioned above, PB can bolster democratic principles by involving the people in the decision-making process. The Chicago example also shows how community members became better educated about priorities within the metroplex, as a whole, which led to better perceptions of community and a higher regard for social justice. Arguably, PB contributes to the notion of improved transparency in the public sector, and as Justice and McNutt (2013) explained, "Fiscal transparency can generally be understood as one requisite for extending the practice of democracy" (p. 5). The following section will explore some best practices of PB and its contribution to fiscal transparency in the public sphere.

## Participatory Budgeting

From its beginnings in Brazil, various iterations of PB have stretched across the globe, with the primary focus at the municipal level. "In the past 20 years, PB has captured the imagination of people around the world thanks to its core concept: citizens deciding public spending" (Lerner 2011, p. 32). Ideally, PB could be implemented at the federal level, but it would require a tremendous undertaking to provide opportunities for a representative cross-section of society to be included in the process. Realistically, democratic systems have a hard enough time encouraging citizens to vote, much less invest time reviewing budget documents and becoming involved in the fiscal decision-making process. PB has experienced success at the local level, perhaps due in part to the close-to-home perspective of residents within the community.

In its 2005 publication on global PB, the United Nations noted five principles of best practices concerning this novel approach to budgeting: "(1) accountability and result orientation; (2) professionalism; (3) proportionality; (4) transparency; and (5) independent check and balance, monitoring institution" (p. 44). Simply holding a town hall meeting and inviting a few public comments on the draft budget is a paltry example of PB in practice; a truly deliberative process incorporates dialogue, as mentioned previously. An exemplary PB endeavor will go even further and treat participants professionally, incorporate accountability and feedback measures, as well as welcome input from a cross-section of the community. Although the logistics of PB vary as widely as the communities utilizing the process, the United Nations' best practices are broad enough to incorporate different PB models.

The United Nations document goes on to explain that performance-based budgeting is a key to improving budgeting processes through accountability. After all, local citizens are the ones impacted by municipal budgets, so it stands to reason that they would be in the position to determine the effectiveness of such budget items. "The performance-based budgeting needs some criterions to evaluate performance and evaluation. It avoids duplication of work plan and budget of state ministries/institutions/unit policies. It needs an integration of performance accountability system in budgeting" (United Nations 2005, p. 45). Involving local citizens through PB can provide a new perspective on what aspects of the budget need to be assessed for performance evaluations.

PB permits citizens to play a role in evaluating budget performance for the purpose of determining future spending by adding another layer of accountability. This local measure of accountability drives the budget process close to home by including those most intimately affected by it. "Through PB, citizens have decided how to spend part of the city budget through an annual series of neighborhood, district, and citywide assemblies" (Lerner 2011, p. 30). Because PB has been instituted primarily at the local level, it encourages networking between community groups that previously may have functioned at odds with one another.

Through dialogue and debate among citizens who have the opportunity to learn about needs and priorities in other areas of their communities, PB provides ". . . a logic of collective action different from what has been the usual fare in cities – one based on proposal rather than demand" (Ganuza et al. 2014, p. 2274). This new communication

dynamic is not without controversy, however. As noted above, associations that previously held the bulk of decision-making power must step aside to allow new voices at the table, which requires relinquishing some control. Likewise, elected officials must be open to hearing input from new sources, which can be a difficult transition for incumbents who have ruled the roost term after term. "PB also requires that politicians, public employees, and citizens adapt to new roles. Politicians need to give up control over some decisions in order to gain community support" (Lerner 2011, p. 34). Although incumbency reelection rates remain extraordinarily high, new practices like PB may put pressure on elected officials to be held accountable to their fiscal decisions more closely than they may have been required in the past.

Lerner (2011) also notes that PB efforts around the world share common ground in terms of establishing needs assessment, deliberation, decision-making, and implementation (p. 31). As with the Chicago example above, citizens from different parts of the community will not likely be on the same page concerning the city's priority spending areas – at least initially, but through a deliberative process of assessing the needs within the greater community and engaging diverse voices in decision-making, municipalities the world over have demonstrated that it is possible to come to agreement on how to parcel out the budget.

As citizens become more aware of the issues at hand and get involved in PB, the seemingly mysterious proceedings of government can become clearer and less intimidating, such that they are more at liberty to express their own ideas and concerns. Grimmelikhuijsen (2012) described it this way: "Transparency leads to demystification of government, a development that is catalyzed by the rising expectations of citizens" (p. 297).

## Transparency

Kopits and Craig (1998) define fiscal transparency as ". . . openness toward the public at large about government structure and functions, fiscal policy intentions, public sector accounts, and projections" (p. 1). The key to this openness lies in the level of public access concerning government activities, which the authors describe as needing to be "reliable, comprehensive, timely, understandable, and internationally comparable information" (p. 1). Providing an executive summary or snapshot of the budget is not enough to consider PB; the information provided to the public must be comprehensive and easily accessed and understood by lay persons. Too often, municipalities may make budgetary information available to the public through a municipal website, but deciphering the poorly labeled spreadsheets is too laborious for many individuals to bother attempting to understand.

Transparency is not simply a blanket, one-dimensional concept suggest Kopits and Craig (1998). In fact, they have identified three dimensions of transparency: aggregate, government operations, and behavioral aspects. The aggregate level covers the disbursement of reliable information to the public about public policy matters. This feature is important to let the public know what priorities or obligations are coming down the pike. Government operations include more specific details about budget documents, including the detailed spreadsheets that some lay persons may not readily understand but still should have access to view. Lastly, behavioral aspects relate to the government's responsiveness to issues such as information requests, codes of conduct, performance assessments, and similar accountability measures (p. 1). When a government entity replies promptly to Freedom of Information requests and similar inquiries, it can reflect positively on the organization because there seems to be nothing to hide.

Nurturing an environment of transparency in the public sphere requires effort on the part of elected officials as well as the public. "Transparency does not just happen," explained Berliner (2014); "such efforts usually require existing principals to commit to institutional reforms that are costly to themselves" (p. 490). When an incumbent implements transparency protocols, they expose their own administrations to the same critiques that they expect other elected officials to

undergo. In other words, opening government operations to public scrutiny may build rapport with the public, but it also makes public officials more vulnerable to criticism. Berliner (2004) also suggested that the incentive for incumbents to jump on the transparency bandwagon and pass policies such as Freedom of Information laws is to gain the support of constituents who hold such promises in high regard (p. 484). The tradeoff between vulnerability and good governance is a worthwhile and necessary step toward deliberative democracy.

While transparency is a popular buzz word among government watchdog groups, it has also gained support on both sides of the partisan aisle as an important practice to implement, regardless of political leanings. "Transparency in government is an issue that has the bipartisan support of progressives and the right" (Justice and McNutt 2013, p. 18). Put another way, transparency helps to keep political friends close and enemies closer. "Transparency increases the likelihood that principals will detect malfeasance on the part of agents and will exact punishment, thereby deterring the abuse of public power" (Bauhr and Grimes 2014, p. 292). Transparency allows political opponents to hold each other in check, not to mention empowering the public with means to keep elected officials on their toes.

"The new era of transparency will increasingly expose gaps between governments' rhetoric and reality, empowering domestic and international audiences to hold leaders more accountable for their decisions" (Larkin 2016, p. 6). Transparency opens closed doors (quite literally, through policies such as Open Meetings Acts) and helps to ensure that public servants are doing just that: serving the public good. In a transparent political environment, campaign promises give way to reality checks, particularly in terms of fiscal responsibility.

When processes like PB are implemented according to best practices and increased transparency in the public sphere, robust public policy is an expected outcome. "Fiscal transparency, in each of its three dimensions, is a necessary condition for sound economic policy," explained Kopits and Craig (1998). "Nontransparent fiscal practices tend to be destabilizing, to create allocative distortions, and to exacerbate inequalities" (p. 2).

Grimmelikhuijsen (2012) equates transparency in government with the Wizard of Oz, in that he seemed almighty until the curtain was opened. "Instead of being seen as powerful and special, government organizations are demystified by transparency" (p. 293). This can be a positive side effect, because everyday citizens become empowered to participate in a process that previously seemed intimidating and elite. However, as Grimmelikhuijsen proposed, individuals may feel disillusioned by the realities of government in practice. "If people can see all mistakes behind the scenes of government, they may become disenchanted with it thus decreasing both the trust in and legitimacy of governments" (p. 295).

One way that citizens can have their idealistic hopes dashed, according to Grimmelikhuijsen (2012), is through the slow and laborious decision-making process itself. "Despite the irrational and incremental nature of public decision making, it is presented to the public as if it is rational and the model of 'rational choice' is being used," noted Grimmelikhuijsen. "Decision-makers lack the ability and resources to find the optimal solution so they apply their 'rationality' only after having greatly simplified the choices available" (p. 298). PB participants who expected to jump into the process with both feet and make sweeping changes may be disappointed to realize that policy making can be a lengthy process.

## Conclusion

In conclusion, participatory budgeting and transparency go hand-in-hand. As local governments strive to meet the increasing demands of a technologically capable public, they would do well to consider incorporating PB into their budgetary processes. Citizens who invest time into the PB process may gain a greater appreciation for the inner workings of the bureaucracy and become better informed, more engaged residents of their communities.

# Globalization, Security, and Drones

Aiden Warren
School of Global, Urban and Social Studies, RMIT University, Melbourne, VIC, Australia

It is evident over the course of history that human beings have had the ingenuity to create varying ways to kill each other, where death can be wrought in a face-to-face fashion or via the direct result of using weapons in immediate propinquity. In the context of war and violence, the advent of technology has provided an expanded corporeal detachment through the use of projectiles with a sling, a bow, or a rifle. Of course, over the last hundred or so years, this detachment has continued to widen as the modern arteries of violence have attained longer range through the use of planes and cruise missiles and, in recent times, the use of uninhabited aerial weapons (Strawser 2013, 3). As this chapter will illustrate, the continual advancement of these new technologies in theaters of conflict pose immense complications and challenges for international security in the twenty-first century. Controlled remotely from virtually anywhere on the planet, such weapons have come to the fore in the military suite and contributed significantly to what has been termed as the further "dehumanization of death" (Strawser 2013, 3). Indeed, referred to as unmanned aerial vehicles (UAVs), remotely piloted vehicles (RPVs), unmanned military systems (UMS) or simply, "drones," these new forms of technology illustrate that "we are currently in the midst of an epochal transformation" of violence (Lathan and Christiansen 2014, 767) in response to what has been deemed a "new species of war" (Mundy 2011, 280).

In looking at this critical juncture in international security, the chapter will begin by looking at the key debates associated with their increasing use after 9/11, including what can be referred to as the "threshold enticement." It will then consider the legal, moral, and ethical discourse surrounding their utility, including those who are complicit in the decisions on when and where to use them, as well as those involved in their science and construction. In the context of humanitarian interventions and state incursions, the chapter also interrogates the varying debates pertaining to the potential of drone usage and the security dilemmas that will continue arise should they remain a significant option in a states' security calculi. Lastly, as technology rapidly advances and drones become wholly autonomous and "off the loop" in the form of "killer robots," the chapter examines the additional complexities that may arise in future security scenarios.

## The Rise of Drones

The use of drones in their varying forms has a lengthy history extending back to World War II; however, it was in the second half of the twentieth century that they became a regular feature in state incursions. (States having employed drones for military purposes during that period include the United States in the Vietnam War (1965–1975), the First Gulf War (1991), and the wars in Bosnia (1995) and Kosovo (1999), Israel in the Lebanon War (1982), and Iran in its war with Iraq (1980–1988).) While the initial inceptions of military drones were used principally for aerial reconnaissance, their applications progressively extended to areas such as communications systems relay, search and rescue, destruction of aggressive air defenses, and direct attacks against designated targets (US Department of Defense 2011, 46). Over the course of the last decade or so, the utility of armed drones has augmented exponentially, beginning with the Second Intifada in the Israeli-occupied areas (since 2000), continuing in the second Iraq War (2003–2011), and attaining its recent status in the context of the United States' war against Al-Qaeda and affiliate groups in Afghanistan, Pakistan, Yemen, and Somalia (since 2001), and against Islamic State of Iraq and Syria (ISIS) (since 2014).

The trajectory that the drone form of operation has obtained in comparison to other alternative means and methods of warfare is quite remarkable, particularly their systematic use for the targeting of preselected persons in the territory of other states. By 2012, the US Department of Defense was in possession of approximately 7000 drones (Stanford/NYU 2012, 8) that performed 20,000 missions per year, with a total of one million combat hours achieved already in 2010 (US Department of Defense 2011, 22). Additionally, it is estimated that between 2004 and 2012, drones operated by the CIA carried out approximately 350 attacks in Pakistan alone, killing somewhere in the vicinity of 2000 and 3000 individuals (European Union 2013, 7). The number of drone strikes in Pakistan reached the astonishing levels of 122 in 2010, although these have somewhat decreased (22 drone strikes in the year 2014) as the US administration broadened its strike to other theaters. The same period has seen as increasing number of drone strikes in Yemen, peaking at 47 in 2012, as well as a limited number in Somalia (New America Foundation 2015a, b).

Of course, with the amplification of drone use, predominantly under the Obama administration, there has also been an evolving division in the discourse pertaining to their legality, strategic utility, and proportionality. In particular, the continued use of drones by the United States in Afghanistan, Yemen, and the Federally Administered Tribal Areas (FATA) of Pakistan and in response to ISIS in Syria/Iraq has presented some moral implications (Strawser 2013, 9). One of the main concerns pertains to the practice known as "targeted killing," a tactic that should otherwise be referred to as an assassination as it is practically identical to an extrajudicial execution. The moral and legal debates deriving from this form of killing itself are extensive and remain markedly complex, particularly as theaters of conflict continue to become more asymmetrical and newer actors enter the scene – the evolving Syria/Iraq conflict being a case point. Notwithstanding their widespread use and moral questions surrounding the practice, however, the perceived efficiency of targeted killing via drone strikes has become evidently acceptable in the public domain in the United States. Indeed, despite the "association of drones and targeted killing [being] inseparable," their acceptance to a war weary and war wary America has evidently been embraced by the "popular imagination" (Strawser 2013, 12).

In the face of this apparent approval, often in the vicinity of 50–60%, there is sufficient evidence to indicate that the use of drones is exceedingly problematic, particularly in regard to their questionable accuracy on what can be termed appropriately as liable targets and non-liable people. While many advocates extol their precision, the targeting proficiencies of their use in many instances have actually yielded disproportionate "collateral harm" (i.e., unintended death) to civilians and noncombatants and, thereby, do not adequately conform with the rules of *jus in bello*. Not surprisingly, assessing the efficacy of the present use of drones remains contentious. The Obama

administration's *jus in bello* arguments, for instance, reflected this uncertainty in what has been termed the "drone myth" (Brunstetter and Braun 2011, 347) – that drones can actually lower the risk of civilian casualties "[b]y loiter[ing] and gather[ing] intelligence for long periods of time before a strike, coupled with the use of precision-guided munition" (General Assembly 2014, 7). The main problem here is that determining the accuracy is dependent on information supplemented by informants in the field, who may or may not be reliable sources of intelligence on the ground. In other words, "the strikes are only as accurate as the intelligence that goes into them" (Mayer 2009). Or, as Sarah Kreps and John Kaag state: "Some observers wrongly conflate increasingly sophisticated technology with increasingly sophisticated individual judgment" (Kreps and Kaag 2012, 2). Additionally, as noted by the UN Special Rapporteur Alston, these accuracy claims are "impossible for outsiders to verify" (Human Rights Council 2010). Simply put, the data that could be considered as the most applicable for evaluating the extent to which particular strikes or a policy of strikes is morally justifiable (i.e., the specifics of who is killed and whether such people were morally liable to be killed) is the type of data that is most lacking, uncertain, non-conclusive, or contradictory (Strawser 2013, 13).

Further criticism of drones pertains to the argument that remote control killing engenders a degree of asymmetry between actors in a conflict. Here, the conflict not only becomes a newer form of warfare but transcends a threshold that, while not discounting the method's acceptability in principle, spurs morally insuperable concerns in a real context. Some analysts claim that this asymmetry does not necessarily make drones inherently "bad," nor they argue, is asymmetry morally applicable if the killing is concise and most importantly, justified. However, there are concerns associated with the marked disparity in risk of harm between *the killed* and *the killer*, brought about by the operators of drones themselves who are not in physical proximity to the vulnerability of combat in which they partake. Philip Alston posits that drones represent a significant change in the conduct of warfare because they "mak[e] it easier to kill targets, with fewer risks to the targeting state" (Human Rights Council 2014). Similarly, Peter Singer argues that the remoteness of the person pulling the trigger may make the act of killing easier as it dehumanizes victims, impersonalizes the battle, and reduces personal accountability (Singer 2009).

In this regard, therefore, targeting actions are executed by people who are not, and never have been, even in close physical proximity to their targets and in most instances have no "real-life" experience of the war zones they only encounter on-screen (Warren and Bode 2014, 114). But while many maintain the view that drones make war more likely by making it "too easy," there is an emerging literature by scholars, such as Julian Savulescu and Zack Beauchamp, who see their use as potentially providing an actual net gain by permitting states to engage in humanitarian military intervention without the risk aversion and, thereby, removing the "threshold" objection against drone employment altogether (Galliott 2015).

## Drones, the Use-of-Force in Interventions and Incursions

As discussed in the above, the most common criticism pertaining to the proliferation of drones is the argument that in removing humans from the combat equation, the costs of going to war are reduced, and thereby, the instigation of war by states that possess drones will become more likely. While there is minimal evidence that the use of drones have actually lowered the threshold to war – any more than, say, cruise missiles or regular aircraft – it is plausible to argue that as the technology progresses and as drones increasingly take the place of humans in combat roles, this critique may gain traction. Notwithstanding this common viewpoint, a contrasting argument has suggested that lowering the threshold is *not* necessarily a bad thing and that drones have the potential to actually advance the practice of

humanitarian intervention, i.e., the use of military force to protect citizens from mass violence such as genocide or ethnic cleansing (Beauchamp and Savulescu 2013, 106). Much of this view stems from the fact that states have a poor track record in intervening in states when there was a very strong justification. While the most defining cases of genocide – Rwanda in 1994 and Darfur from 2003 to 2007 – were not met with international intervention (This cutoff point of 1990 is non-arbitrary because (1) 1990–2000 saw more humanitarian interventions than any other 10-year period in history and (2) modern understandings of humanitarian intervention have shifted considerably in the post-Cold War period. *See*, Martha Finnemore, *The Purpose of Humanitarian Intervention: Changing Beliefs about the Use of Force*, Ithaca, NY: Cornell University Press 2003.), there are persistent and contemporary conflicts involving extraordinary suffering that have also not resulted in intervention. Even in instances where intervention has taken place, mass atrocities have been allowed to go on for an extensive period of time (e.g., Kosovo and Timor-Leste, both in 1999). (Libya 2011 is a rare exceptive case where intervention was premised on the imminent risk of mass atrocities rather than evidence of ongoing atrocities. For evidence that views of the morality of intervention are shifting, see International Commission on Intervention and State Sovereignty (ICISS), The Responsibility to Protect, Ottawa: International Development Research Centre, 2001; Weiss 1995.)

The Obama administration's nonintervention in Syria is a further case in point. Over the course of the Syrian conflict, many commentators have supported intervention on humanitarian grounds in line with the emerging norm of the responsibility to protect (R2P). Although the Obama administration regularly declared that force should be used as a last option in Syria after "exhausting a host of other measures," (Rice 2013) it was only the revelation that Asaad had used chemical weapons on innocents that an intervention was seriously considered in the conflict that up until that point had seen 150,000 people perish. The humanitarian rationale for an intervention continued to be present well after the Obama administration decided to vie for political resolution in September/October 2013 (BBC News 2013). Neither the indiscriminate bombing of Aleppo by the Syrian regime in mid-December of the said year (Eddy and Cottrell 2014) nor any subsequent reports on grave human rights violations and crimes against humanity coming from Syria (Human Rights Council 2014) shifted the positions of both Democrats and Republicans. This raises questions about the subjectivity of intervention conditions, in particular Obama's so-called red line on chemical weapons (Kessler 2013). Moreover, because the United States would not endorse these unilateral use-of-force considerations if undertaken by other member states, it appeared as though it was supporting an exception to the rules applicable only to *itself* and *its* own vested interests.

Clearly, there is a disinclination on the part of industrialized democracies – the only states with the capacity to undertake a successful intervention – to risk their own soldiers for foreign lives. There are a myriad of reasons for this aversion, ranging from what is perceived to be the moral responsibilities to their own soldiers' and nation's interests, to the political inhibition posed by the predominance of differing beliefs among their respective domestic public or political factions (Beauchamp and Savulescu 2013, 109). If casualty aversion has been deemed to be a significant constraint, then by removing combat roles away from humans, drones may enable military decision-makers, generals, and policymakers to actually execute strategies gauged toward minimizing civilian deaths *rather* than being focused on averting their own casualties. So while drones significantly lower the threshold in going to war, it is argued by some proponents that their significance in reducing the need for humans in risky combat roles can, thereby, ameliorate the effect of casualty aversion in the consideration of intervention and mitigating genocide.

In other words, if drones can be effective enough in conflict that states are prepared to use them in lieu of humans, then they can be effectively deployed in humanitarian interventions and

enable the development of a strategy for protecting civilians with less impediments presented by the prospect of human casualties. UAVs, such as the Predator and Reaper, have illustrated their utility for humanitarian intervention in Libya (Beauchamp and Savulescu 2013, 119). In this regard, proponents argue that UAVs are able to differentiate between adversaries and noncombatants and can engage ground troops in ways that would be limited through the use of a manned aircraft. Additionally, surveillance drones can provide important advantages to peacekeepers in the context of information-gathering activities near populations at risk, identify potential arms smugglers and embargo breakers that could have thwarted their efforts, and provide overall situational awareness and therefore the capacity to respond promptly when people were at risk – evident in Chad in 2009 (Whetham 2015, 199–200). Likewise, in 2013, the UNSC granted the Department of Peacekeeping Operations (DPKO) permission to bring in surveillance drones to support the United Nations Organization Stabilization Mission in the Democratic Republic of the Congo (MONUSCO) (Whetham 2015, 199–200). According to Colum Lynch, these drones were "equipped with infrared technology that could detect troops hidden beneath forest canopy or operating at night, allowing them to track movements of armed militias, assist patrols heading into hostile territory, and document atrocities" (Lynch 2013). While signifying to adversarial actors that they *can be seen wherever they are* cuts against standard surveillance practice (where the idea is generally to watch without the actor being aware), it does provide a form of deterrence insofar that if they can be seen, they can be caught, and they can also be killed (Whetham 2015, 199–200). (This may be part of the political calculation in the publicity surrounding the deployment of observation drones to the Ukraine by the Organisation for Security and Cooperation in Europe. See Jason Hovet and Jan Lopatka, "OSCE says will Use Drones for Ceasefire Monitoring in Ukraine," *Reuters*, 10 September 2014, available at, http://www.reuters.com/article/2014/09/10/usukraine-crisis-osce-idUSKBN0H50Q920140910.)

## Drone Proliferation

Despite some of the potential advantages of using technology in humanitarian interventions mentioned here, other broader security concerns have been raised pertaining to a potential arms race. While China's acquisition of drone technology has already engendered consternation in hawkish circles, other states have also entered debates in their own active push to acquire drones for military applications. On September 7, 2015, Pakistan officially became the world's ninth state to efficaciously develop its own unmanned combat aerial vehicle, used in an incursion against the Taliban in the northwestern tribal area near its border with Afghanistan. Aside from furthering Pakistan's advance against the Taliban, in which three militants perished, the drone strike pointed to a potential shift in the theater's equation, where the era of Washington's own drone actions within Pakistani sovereignty may be drawing to a close (Fazl-e-Haider 2015).

Moreover, the fleet of armed drones has emboldened the Pakistani states' military strength against both internal and external threats. Apart from the internal Taliban-led insurgency in its northwest, and a separatist insurgency in its southwest, Pakistan faces an external volatile situation on both its eastern border with India and its western border with war-torn Afghanistan. With both armed and unarmed UAVs, it can better monitor the security developments on its borders and undertake missions including intelligence gathering and target detection and destruction. Not surprisingly, any justification endorsing the use of drones will only be further complicated as states like Pakistan join the "drone club." It is already evident that Pakistan's participation has spurred a race in South Asia, with India recently amplifying the production of its own unmanned aerial vehicle development program, the Rustom-2. It has purportedly accelerated its work on weaponizing the Rustom-1 medium-altitude long-endurance UAV, which it tested in 2016. Additionally, New Delhi has reportedly endorsed the acquisition of ten armed UAVs from Israel Aerospace Industries under a $400 million deal (Fazl-e-Haider 2015).

In response to the burgeoning desire and real acquisitions of drones by an increasing number of states, Buchanan and Keohane have proposed the establishment of a drone accountability regime to ensure better compliance with the existing law and to prevent the rules being undermined through an apparent lack of accountability. For a plethora of reasons states have been disinclined to publicize the specific details of their actions when using lethal drones, "especially extraterritorially" (Whetham 2015, 204). However, this can understandably create the view that the rules are being contravened and the law ignored. Even if the action has been undertaken with the best of intentions and a justification based on a clear self-defense requirement in the face of an imminent threat, with the absence of a credible explanation, it might as well be considered an assassination or murder – there is no way for the rest of the world to tell the difference. Buchanan and Keohane's intention, therefore, is to build toward a position in which an impartial ombudsman can review the legal justification for an attack and has the right to hold actors to a standard in meeting their responsibilities. While conceived for a different context, such a regime, if expanded to cover observer missions of the type, might address many of the political problems with deploying drones to monitor and prevent human rights abuses in the case of an intervention (Whetham 2015, 204).

## The Precursor to New(er) and Evolving Technologies

Further complexities regarding the evolving role drone technology may play in international security are evident with the advent and continued emergence of lethal autonomous robotics. The reality is that existing armed unmanned aerial vehicles are clearly the precursors to what is termed as autonomous robotics; devices that can choose targets without further human intervention once they are programmed and activated. While this may appear somewhat exaggerated, the Pentagon is already planning for them, "envisioning a gradual reduction by 2036 of the degree of human control over such unmanned weapons and systems, until humans are completely out of the loop" (Garcia 2015). Referred to as "lethal autonomous robots" (LARs), "lethal autonomous weapons systems" (LAWS), and "fully autonomous weapons systems" (FAWS) (Wegmann 2014, 7–8), the former UN High Commissioner for Human Rights, Navi Pillay, has said that these "so-called 'killer robots' – autonomous weapons systems that can select and hit a target without human intervention – are no longer science fiction, but a reality" (Pilay 2013). Unlike drones, fully autonomous robots would make their own decisions and act independently from humans. The term "human out of the loop" (Melzer 2013, 6) has proven uncomfortable for both policymakers and analyst alike (Belarus 2014). While no one is exactly sure how these robots of the future will evolve, or what actions they might be able to perform, roboticists, soldiers, politicians, lawyers, and philosophers must ask some very complex and interdisciplinary questions regarding the future use of LAWS, particularly if considered to be a device used in a humanitarian context.

Notwithstanding the varying delineations in the discourse, it is evident that as such weapons continue to evolve *out of* present-day UAVs to the truly autonomous kind, debates relating to the morals and ethics of war fighting and interventions will increasingly become more complex (Strawser 2013, 16). Certainly, the advent and deployment of autonomous weapons systems that have the capacity to wield deadly force without the involvement of a human actor engenders a distinguishing set of ethical concerns. Some of these concerns pertain to the extent to which they may further lower the threshold for military action, the accountability for deaths produced by these devices, and the prospect that autonomous weapons could – as farfetched as this may sound now – turn against those who have designed them (Sparrow 2007, 62–77; Merchant 2011, 272–315; Sharkey 2008, 4–17; Asaro 2008, 50–64). An array of contemporary security theaters signify that such weapons will continue to play an increasingly important role in future conflicts, particularly given that many states in the context of the wars of choice rather than necessity are

concerned by casualty and subsequent political fallout. In this light, unmanned systems provide the scope in which states may conduct military campaigns and minimize the risk of their citizens perishing, e.g., by providing real-time video of the terrain they review, thereby allowing force to be used more accurately.

An additional appeal to states pertains to the economic aspect. Many militaries are under budgetary pressure and unmanned systems are viewed to be more cost efficient than those they replace. While these can be considered as the political merits of LAWS, there are a number of important military-strategic benefits (as mentioned in the above) that "greatly reduce the fog of war" in enabling strategic operations, accelerating the tempo of battle, and which subsequently places pressure on adversarial militaries to adapt to these systems and new forms of conflict (Adams 2001, 57–71; Sparrow 2013, 87). Overall, the prevailing view from proponents is that unmanned systems can actually help keep warfighters out of harm's way and thus enable decision-makers to embolden the strength of their forces, while fulfilling the responsibility to protect the lives of those under their command. It is this rationale that will see a "greatly increased role for unmanned systems in the future of the armed services" (Singer 2009; Sparrow 2013, 88). Of course, the almost revolutionary like advancement in new technologies – particularly as they become *truly* autonomous and "off the loop" – will pose immense quandaries in the context of future asymmetrical and ambiguous conflicts. While advancements are not yet at the stage where machines and robots are completely "off the loop" and make their own decisions on when and where to go to war, the current Iraq War 3.0 has multiple actors – the US, ISIS, Iran, and Iraqi government forces – who are using various forms of drones with some autonomous capabilities (Singer 2015).

## Conclusion

It is evident that "drones, for both civilian and military applications, are here to stay" (Kreps 2016, 1). In the military context, many states have observed the United States' usage of combat drones and have sought to add them to their own military suite. Indeed, the capacity to use force at no risk to a states' own troops while avoiding political and domestic criticism at home is clearly a tantalizing option, signified by the expanding proliferation of drones across many states. Russia has indicated that its creation of a combat UAV that will be ready to use in 2017/2018 is meant to "balance" the amplified usage of the United States in Afghanistan and Pakistan. As indicated above, there are a plethora of other states, Israel, India, China, Pakistan, Turkey, and United Arab Emirates, which are also trying to acquire – if they have not already – armed UAVs for military applications (Kreps 2016, 5–6). As the forerunner to lethal autonomous robotics (LAWS), concerns deriving from the expanding use of UAVs in the context of legalities, ethical procurement, privacy and data protection, transparency and informed consent, and collateral damage will continue to be subject to extensive debate, particularly in regard to the evolving and asymmetrical nature of conflict (D'Onofrio 2014).

As technology continues to expand and as the human role moves from being "in the loop" of the decision-making process (with such devices making all the key calls) to "on the loop" of the decision-making process (where the role pertains to overseeing operations rather than actually directing), complexities and debate will continue to arise as the human role moves ultimately to "out of the loop" (Gilman 2014). Additionally, as cyber-conflict, artificial intelligence, and software algorithms that increasingly make most of the decisions at digital speed continue to expand, the question of where this will fit in the context of current and future conflicts, humanitarian interventions, international law, and considerations regarding the further "dehumanization of death" remains problematic to say the least. The issue has already drawn the attention of the international community, underlined with three expert meetings on LAWS held by state parties of the Convention on Certain Conventional Weapons (CCW) at the UN office in Geneva in 2014 and 2015 (UN Mission to the UN 2014). While

international humanitarian law mandates that the use of force must be proportional and circumvent indiscriminate damage and killings, the use of "killer robots will be unable to adequately assess proportionality and precision," that is, where discerning decisions of proportionality of force are needed to evaluate "dynamic environments" and "require highly qualitative and subjective knowledge, just the things that robots could lack" (Garcia 2015). Given that international law is ill-equipped to deal with the myriad of advances in such weapons technology (by the time law is adjusted for one set of technologies, a new set emerges), the regulation of drones, let alone "killer robots" in the context of complex and evolving conflicts, will clearly remain an ongoing security challenge deep into the twenty-first century.

# Goal-Setting Theory of Organizations

Randall S. Davis
Southern Illinois University, Carbondale, IL, USA

## Synonyms

Goal ambiguity; Goal conflict; Goal multiplicity; Role ambiguity

## Definition

Goal-setting theory, as applied to organizations, is a theory of human motivation that explains how and why individual work performance increases when organizations establish specific and challenging goals valued by employees.

## Introduction

Goal-setting theory, originally formulated by Locke and Latham (1990), draws from research across a wide range of disciplines to explain how and why individuals are motivated to achieve goals. In goal-setting theory, the term goal refers to an object that directs action, and each goal is comprised of content and intensity (Locke and

Latham 2013). Goal content is defined as the result one seeks to achieve. Goal intensity, on the other hand, "refers to the effort needed to set a goal, the position of a goal in an individual's goal hierarchy, and the extent to which a person is committed to goal attainment" (Locke and Latham 2013, p. 5). Additionally, the locus of generation changes across goals. The distinction between self-set, participatively established, and assigned goals acknowledges variation in the location of goal generation (Locke and Latham 2013). Self-set goals refer to an object that directs action imposed by an individual on oneself, participative goals refer to an object that directs action established through collaboration between the individual responsible for goal attainment and other interested stakeholders, and assigned goals are objects that direct action externally imposed on the individual responsible for attainment in the absence of consultation regarding demands. Although these concepts apply across a range of circumstances, a goal-setting theory of organizations employs the basic tenets of the theory in two ways. First, some research focuses on cultivating a better understanding of how the relationship between employee and organization influences work attitudes. Second, research examines how an organization can leverage goals to elevate individual performance. Given the importance of goal-setting theory for employee and organizational performance, the remainder of this entry proceeds in two steps. First it describes the psychological processes through which goals motivate employees and the individual-level outcomes of goal setting. Second, it describes the application of goal-setting theory in public administration literature.

## Outcomes of Goal Setting for Individuals and Organizations

Organizational behavior research consistently illustrates that specific, challenging goals enhance job performance and the psychological well-being of employees (Locke and Latham 1990). The motivating potential of goals stems from three interconnected assertions. First, clear goals send signals to employees regarding what an organization demands of them as well as the organization's strategic orientation. These features provide a mechanism through which employees can direct effort to appropriate activities and appraise work effort in relation to organizational expectations (Locke and Latham 1990, 2013). Second, increased self-efficacy, or one's belief that they have the capacity to succeed, influences one's commitment toward goal attainment due to the enhanced expectation by employees that they can achieve goal-related tasks (Bandura 1997). Employees exhibit favorable emotional responses when they achieve established goals and display negative emotions when they fail to meet goals (Locke and Latham 1990). As such, self-efficacy influences one's drive to pursue goal demands because the effort one expends is contingent upon their belief that effort will lead to goal achievement. Third, clear goals foster employee persistence, where persistence refers to the time an individual is willing to expend in attempt to achieve a goal (Locke and Latham 2002). The persistence one invests toward achieving goals stems from the extent to which the expectations embedded in the goal are clear and precise. Ambiguous goals are less able to encourage persistence because the individual cannot determine whether their effort is directed at an appropriate object. The ability of clear, challenging goals to enhance employee motivation and performance has encouraged organizations, public and private, to implement several reforms (e.g., performance measurement and strategic planning) designed to clarify goals for employees.

Perhaps the most important outcome of goal setting for individuals and organizations is heightened levels of employee performance (Locke and Latham 1990). Research consistently illustrates that clear, challenging goals encourage employees to exhibit higher performance as compared to vague, "do-your-best" goals. As illustrated above vague or ambiguous goals are less able to enhance performance because they do not direct the attention and action of an employee to an objective performance expectation. Performance becomes highly subjective when goals lack a specific behavior referent, which compromises the

ability of the individual to understand task expectations. However, in addition to the direct influence of specific, challenging goals on performance, goals also indirectly influence performance through a host of intervening variables.

First, the effects of unclear goals spill over into employee roles, leading to heightened role ambiguity for the employee. Role ambiguity refers to a circumstance where employees lack the information necessary to appropriately fulfill work roles (Rizzo et al. 1970). Heightened role ambiguity subsequently reduces self-efficacy, or the employee's belief that they can achieve the expectations set forward by the organization, which reduces motivation to pursue goal expectations. Importantly, increased role ambiguity damages performance directly, but it also represents a form of occupational stress with deleterious physical and emotional side effects. First, research indicates that role ambiguity increases chances of physical illness, which results in increased turnover and work absence (Rizzo et al. 1970). Second, role ambiguity exacts an emotional toll on employees in the form of increased anxiety, depression, and fear (Kahn et al. 1964). Both the physical and psychological effects of role ambiguity undermine the ability of an employee to perform.

Second, employees exhibit an emotional response in reference to goals. When individuals successfully meet goal expectations, they exhibit favorable emotions, whereas when individuals fail to achieve tasks set forth in goals, negative emotions result (Locke and Latham 1990). Job satisfaction represents one of the primary favorable emotions that result from goal attainment. Job satisfaction is defined as an emotional response to work that occurs when an individual appraises their action in relation to some work-related value standard (Locke 1969). Since goals serve as a value standard upon which employees appraise their effort (Locke and Latham 2013), the emotional satisfaction one experiences during goal attainment arises because one appraises their action as facilitative of achieving preferred values. Although some debate the importance of job satisfaction as a predictor of performance, evidence suggests that increases in satisfaction lead to moderate performance gains.

Finally, the strength of the relationship between setting clear, challenging goals and physical, emotional, and performance benefits is conditioned on a host of moderating variables. One's ability to perform a task, the performance feedback they receive, their commitment to the goal, resource constraints experienced, complexity of the task, and personality traits of the individual all influence the ability of challenging specific goals to influence performance (Locke and Latham 1990, 2013). While the theoretical explanations regarding how each of these moderators influences performance vary across scholars, each hinges on the notion that the individual responsible for goal attainment must possess two pieces of information:

1. The individual must be provided with the information necessary to know that they have completed task expectations to the satisfaction of the organization (e.g., through feedback).
2. The individual must possess the personal attributes (e.g., personality traits and goal commitment) and the means (e.g., ability and external resources) required to achieve the tasks set forward in the goal.

When one possesses necessary informational, personal, and organizational resources, establishing clear, challenging goals will foster favorable psychological responses to work and increased performance. Alternatively, the absence of these resources dampens the effect of clear goals on performance and performance-related variables. Given these basic tenets, public administration research regularly seeks to adapt goal-setting theory to understand the complex interaction between public organizations, their political environment, and employee performance.

## Goal-Setting Theory in Public Administration

In public administration, research that employs goal-setting theory is somewhat more limited as compared to research examining goals in the

broader field of organizational behavior. While the basic theoretical assumptions of goal-setting theory apply equally to public and private organizations, researchers in the public administration tradition often employ goal-setting theory to examine the importance of the relative clarity or ambiguity of assigned goals for individuals in public organizations (Chun and Rainey 2005a, b). Indeed, one of the most common, although contested, assertions in public administration is that the political environment encourages goals that are more numerous, conflicting, and vague as compared to private organizations. The limited focus of public administration scholarship on the relative ambiguity of assigned goals stems from two interrelated factors: the "wicked" or complex nature of public problems and the salience of the political environment for public organizations.

First, the overarching goals public organizations seek to meet address public policy problems are "wicked," defined as highly technical and complex with multiple plausible solutions, few of which are clearly correct or incorrect (Head 2008). Unfortunately, goal clarity evades organizations responsible for resolving wicked problems because those responsible for setting goals possess little certainty that a given organizational action will result in meaningful progress toward problem resolution. In the face of intractable problems, public organizations are forced to embrace ambiguity because society expects government organization to work toward solving complex problems.

Second, the overarching goals public organizations must meet are defined in the form of policy expectations established external to the organization by elected officials. The observation that the primary goals of public organizations emanate from the political environment suggests that most of the goals public organizations are expected to meet are established externally. Ultimately, this leads to the more narrow focus in public administration on externally established or assigned goals. Additionally, public administration scholars often attribute goal complexity and ambiguity to the politically assigned goals of public organizations. The policy goals imposed on public organizations by elected officials often lack the clarity necessary for facilitating organizational performance because the elected institutions of government have become increasingly unable to meaningfully debate and resolve the most pressing policy issues society faces (Meier 1997; Wildavsky 1988). As such, the conflicting interests present in increasingly contentious political environments contribute to fundamental disagreements between elected officials that prohibit elected officials from articulating and communicating definitive implementation goals to public organizations.

## Conclusion

Goal-setting theory applies to a broad range of contexts, and empirical research consistently indicates the utility of goal-setting theory for understanding human motivation. When applied to organizations, goal-setting theory specifically focuses on the favorable employment outcomes associated with clear, challenging goals that employees value. In the context of public administration, however, much of what we know about goals and goal setting is associated with the concept of goal ambiguity. The assumption within the public administration literature on goals is that complexity and contention in the political environment lead to vague, conflicting, and numerous goals. Unfortunately, political complexity undermines the ability of public organizations to leverage the characteristics of goals to motivate employees. While research certainly suggests that public managers do possess the capacity to clarify goals for public employees, examining the political context of public organizations accounts for the wider array of contingencies that shape the goals of public organizations. To the extent politics complicates the goal-setting process for public organizations, it is important to understand the mechanisms through which managers can clarify goals for public employees.

# God, Science, and Organizations

Heidi O. Koenig
Department of Public Administration, Northern Illinois University, DeKalb, IL, USA

## Synonyms

Organizations; Scientific reasoning; Spirituality

## Definition

God: The one spiritual force behind a single religious tradition. The defining factor of this concept is that it is universally recognized with that faith community as the foundational representation of spirit.

Science: Knowledge gained using a specific type of analytical questioning. Science is both the process of gaining knowledge with the overarching, agreed-upon goal of rigorous investigation and the useful knowledge that is produced following the use of the agreed-upon method.

Organizations: Societally acknowledged entities, designed and crafted to fulfill one or more purposes for the individuals involved in the construction of the organization.

## Introduction

Our simplest understanding of the words "God" and "science" are provided by the definitions to this chapter. By placing each of these concepts in the parameters of how tradition has allowed us to incorporate them, we are able to clarify for ourselves the very nature of the concept. What does "God" mean without a faith tradition? And what is "science" without the underlying concept of having the ability to develop knowledge? At times our thinking is reduced to the dichotomous "faith" and "scientifically proven." This can easily become a mere dialectic – are you a man of science or a man of God? Do you believe in what you know to exist or do you believe in those things unseen? In this light, the existence of one precludes the other – either you believe in God or in science. It is also possible to see that both may exist. We are able to accept the existence of each when we recognize different realms of knowledge. As long as the limits of the realm are kept, there is no problem. Barbour identifies these categories (2000), and they have become the dominant structure for examining the way the relationship occurs. A different position is taken when asserting that we should understand the concepts through dialogue about the existence of God and science and the idea that it is possible to integrate our understanding of God and science into a

single explanation of the world. Integration is not often proposed by scholars as the metaphysics of this process is too great. Instead, many people thinking and writing about the God/Science interaction adopt the perspective of dialogue.

It is preferable that rather than resting on positions that highlight the dichotomy, we need to find a new way of seeing relationships. If we are to find relationships, it is important we move forward to several points of where God and Science can come to a shared space to inform public action. Barbour (2000) recommends approaching this relationship from the perspective of a dialogue. We won't be able to reconcile all concepts within both traditions, but we should be able to identify points at which God and Science inform each other. His writings assert the need for dialogue between areas in the physical sciences and God. Still, Barbour's work provides an interesting starting point for the discussion of the ways we may see how God and Science relate to each other, at times using the organization as a place for the dialogue to take place.

We have studied organizations since the inception of the discipline of public administration. Three philosophical eras will be used to examine the God, Science, and organization relationship. The first of these is writings from classical public administration. The second setting for these questions is new public administration. The third setting is new public service and some examples from the literature that marks that system of thinking.

This chapter identifies public administration's perspective on the questions of God and Science as an underlying argument involving the acceptance of science as the basis for all public administrative action. Our willingness to adopt the position of conflict, independence, and dialogue about the "God vs. science" relationship is carried out in how we structure our organizations and use those organizations achieve public purposes.

## The Classical Period: The Rise of Science

Public administration, acknowledged as an area during the early twentieth century, was clearly identified as "not politics." With the rise of progressivism, public administrators found a ready path toward scientific logic in taking action – it was possible to view the good that was expected to occur by looking at systematic methods of attaining those results. Right from the beginning of modern public administration, we have been oriented toward adopting a science-driven understanding of the world (Nelson 1998). The individuals who guided the ideals of the progressive movement into public administration did so understanding that the underlying promise of progressivism led away from personal expressions of power and relationships and focused toward the benefits of government action that had been removed from individual influence.

The writings of the field's earliest contributors focused on the details of administration. Leonard White, in *Introduction to the Study of Public Administration* (1926), began with the assumption that "administration is still primarily an art but attaches importance to the significant tendency to transform it into a science" (pp. vi–vii). Perhaps it is not surprising that the earliest writings in the field are vacant in reference to the existence of God and of religious or spiritual forces in the processes of the administration of public goods and services. White's reference to public administration as an art is a sign that administration could be viewed as something unique created by the individual, an indication of a spiritual force. Indeed, there is little said about the role of God in the workings of public administration and by moving so quickly to a position emphasizing science it would appear this area of thought was not developed. Careful consideration of the God vs. science tension could only have occurred prior to much of the writing in the area of public administration, particularly as the discipline had joined into the popular scientific management movement. Apparently, confirming the importance of public administration as a systematic way of accomplishing a particular end took away all impetus to discovering different attributes of the motivation to engage in this type of public activity. In this light, Simon's (1945) critique of the scientific management movement was not a point of redirection but instead was the next step in moving the discipline of public administration toward a true statement of scientific

principles. Although Simon and the other scholars who adopt a behaviorist approach do not develop a challenge the belief in God, their writings indicate that the realm of public action is governed completely by scientific principles. At this point in public administration, God and science are independent from one another. Indeed, the literature doesn't refer to God. For all intents and purposes, God may not even exist, much less be a bone of contention.

Our organizations have been created and replicated to ensure the ideals that the public administrator is part of a process that requires the use of science to ensure equivalent treatment of all individuals who come into contact with the organization. The influence of progressivism, adoption of the logic of scientific management, critique of the use of scientific management, and rise of modern behaviorism are all part of the process of discovering the best way to provide services through the use of public organizations. The phenomenon is self-reinforcing. Without those structures, it wouldn't be possible to do the work of the public administrator, and it is through the creation of structures that rest on the philosophy of differentiation of the individual and the provision of services that public administration is possible.

This is a cycle anticipated by Polkinghorne (2011) when he notes that science without an external frame of reference engages in the process of acting as a manner of science without creating knowledge. Polkinghorne's writings focus on the natural sciences but apply here as well. When public administrative organizations are created to facilitate action that relies on the success or failure of organizations similarly created through science, we find ourselves in a cycle we cannot escape through our organizations.

## The New Public Administration Challenge: Opening Public Administration to Dialogue

The new public administration (NPA) movement purposefully offers the opportunity to build discussions on the rule of science in the public sector. The structure of the "values" of NPA – responsiveness, decision-making processes that include workers and citizens, social equity, citizen power with regard to the bureaucracy, and administrative responsibility – (Frederickson 1980) creates an opening where dialogue about God and science might occur.

The work of Dwight Waldo, H. George Frederickson, and Frank Marini documents the beginnings of NPA, and their work is still the focus of much of the literature utilizing a new public administration. Frederickson, comparing new public administration and new public management, notes that the rise of NPA was based on the need to have organizations that respond to the environment of public action (Frederickson 1996). He argues that "new public administration calls for shifting the emphasis from managing the insides of an organization to managing boundary relations with citizens, other government agencies, interest groups, and elected executives and legislators" (Frederickson 1996, p. 267). These changes would require change in the structure of public organizations to allow the different relationships between public administrators and citizens. The organizations were not to be demolished but were instead reoriented in a way that services could be provided in an effective manner to those who needed them rather than a way that was predetermined by the history of the organization. This change in the role of organizations is one of the most significant differences between classical public administration and new public administration.

The challenges posed by NPA have led to a wide variety of literatures that emphasize the "other" as part of the administrative process. Literature on including benevolence as part of the decision-making process (Gawthrop 1997; Frederickson 2002) and the rise of social equity literature (Wooldridge and Gooden 2009) are instances when the public administrator considers the interests of the citizen or service recipient.

New public administration fits as a change that Polkinghorne (2011) would acknowledge as a portion of public administration moving toward an external framework. In the classical (behaviorist) era of public administration, organizations are created to fill a need and the need then becomes the definition of the organization. New public administration's challenge to the traditional

organization structure relies on the recognition of values outside the ones already used in creating those structures. The organization has to change to satisfy the needs of the people outside the boundaries of the organization.

## New Public Service: Dialogue?

The new public management movement followed the new public administration movement in the United States. New public management is, in many ways, a return to Simon's challenge to classical public administration. While Simon challenged the models generated from scientific management, new public management challenges the models of bureaucratic action that existed at the end of the classical public administration. Osborne and Gaebler's (1992) concepts that led to the development of new public management defines the public administrator as an entrepreneur rather than waiting for the organization to determine a course of action. Economic thought guides new public management, although the study of the practice is scientific in nature. Rather than building a different base for action following the critique of classical public administration, new public management returns to business models for guidance. New public management was similar to the scientific management movement in public administration during the early twentieth century, except rather than adopting the business techniques into public administration, new public management espoused the practices and values of business as appropriate to run public organizations.

At the same time new public management was gaining strength, other scholars began to examine public administration from disciplines outside the traditional organizational models. Denhardt and Denhardt (2000) note that this process was many faceted and resulted in the recognition that "because we depend on one another in the postmodern world, governance must be based on sincere and open discourse among all parties, including citizens and administrators" (p. 553). This is the point at which the dialogue about God and science can occur because the organizational structure is created that will allow multiple views to be expressed and considered sincerely. The perspective is embedded in the new public service movement.

New public service is the model that brings together new public administration and current management models. The argument that new public service makes is that we have to restructure our thoughts and our organizations to make sure that public administrators are responsive to citizens' needs and at the same time are accountable for decisions administrators make. The normative model contained in Denhardt and Denhardt's book is an argument that responds to the classical model of public administration and the new public management model (Denhardt and Denhardt 2011). In the book they argue that public administrators need to be able to identify and address problems and that citizens must be part of that process. The argument is profound in its simplicity. It opens the question: what is "new" about current public service models and how do we incorporate information and practices from public administration and other disciplines so that we can have a discussion? The topics of discussion range from questions of the impact of the use of networks in public organizations (Weber and Khademian 2008) to ways to build rates of participation to solve problems that occur at the level of the community (Lasker and Weiss 2003) to the potential for impact of democracy as the new public service is layered onto existing models of government processes (Perry 2007).

Beginning a dialogue about God and science in public administration can only take place under a model that accommodates multiple voices without forcing public administration to favor one about another and acknowledging that organizations may exist as the setting where the needs identified by the different parties are discussed. It is possible new public service can be that the framework required to allow discussions necessary to the opening dialogue about God, science, and organizations.

## Conclusion

Organizations provide structure. We rely on them to accomplish agreed-upon goals and at times to

identify the goals needed. During different periods in public administration organizations have taken on different roles. During three models of public administrative thought (classical, new public administration, new public service), the way organizations are used by public administrators reflect the ways in which we think about science and at times God. Models that challenge what organizations exist and how those organizations affect the work of the public administrator provide us the opportunity to reflect on what we know and how do we know it. Organization change may broaden our ability to incorporate diverse voices and identify new intersections between public administration and other fields of study. Currently, the new public service model provides public administration with the broadest coherent framework through which to engage these diverse voices in an effort to achieve a broader understanding of the work of the public sector.

This chapter began with a discussion of God, science, and how they relate to one another. Different ways of understanding that relationship include conflict, independence, dialogue, and integration. Conflict and independence rely on complete separation of the concepts of God and science – conflict requiring an individual dominance understanding and independence requiring recognition that both may exist although not in the same realm of knowledge. Integration is a metaphysical challenge and is beyond this research. Dialogue is necessary to develop our understanding of the relationship between science and God. In public administration, our dialogue occurs in organizations and broadening our understanding through that dialogue is found in addressing the challenges we pose to those organizations.

# Going from Government to Governance

Christian Lo
Faculty of Social Sciences, Nord University, Bodø, Norway

## Synonyms

Governing without government; Transformation thesis

## Definition

*Going from government to governance* describes a shift in the processes of public decision-making and the governing of society and economy. In this context, *government* refers to the hierarchal regime characterizing traditional visions of the unitary state. *Governance*, meanwhile, points to multilayered points of policy-making involving a plurality of public and private actors.

## Introduction

The phrase *going from government to governance* describes a shift within public management where networked forms of *governance* are claimed to be replacing traditional hierarchical modes of *government*. Known also as the *transformation thesis*, this notion of a general transformation in public management in the western world is a both central and contested issue in the network governance literature (see particularly Osborne 2010; Rhodes 1997; Sørensen and Torfing 2007).

While the content and application of the term "governance" varies in the literature, the notion of a transition from *government* to *governance* generally conflates *governance* with the concept of *network governance*, here understood as pluricentric forms of governing processes contrasted to multicentric forms (i.e., the market) and hierarchical forms (*government,* e.g., the state) (Kersbergen and Waarden 2004). As such, network governance is understood as a *mode of coordination* regulating the patterns of negotiated interaction between a plurality of public, semi-public, and private actors in the production of public policy (Sørensen and Torfing 2007). Within governance theory the term *network governance* is widely used to describe collaborative relations both between different public actors and between public and private actors. In this chapter, the concept of network governance is applied broadly to encompass related terms applied in the network governance literature, including "the new public governance" (Osborne 2010) and "interactive governance" (Torfing et al. 2012).

This chapter begins with a brief outline of the basic premises informing the notion of a transformation from *government* to *governance* in early – often labeled *first wave* – governance theory. This claim of a general transformation has been subjected to substantial critique in more recent governance theory, which is also presented this chapter. One central strain of such critique questions the novelty of network governance and argues that the post-traditional claims underpinning the transformation thesis lead to a troublesome normative and deterministic bias toward network governance in the literature. A second central strain of critique addresses the suggestion that governance is simply *replacing* government and argues that this suggestion leads to the erroneous conclusion that the role of the state is diminishing. To avoid the latter conclusion, a *second wave* of governance theory, discussed in the second part of this chapter, has reintroduced the state by formulating an alternative model of transformation where the state has a continued hand in governance through engaging in *meta-governance*. In this part of the chapter, attention is also given to some seminal perspectives attempting to diversify and advance governance theory beyond the single account of going from *government* to *governance*. The final section of the chapter summarizes the analytical implications of the academic debate about the transformation thesis.

## State of the Art

Most of the early literature and theory on governance networks has been developed in relation to the British political context of increased public-private cooperation during the neoliberal doctrines of governing brought on by Thatcherism since the late 1970s and also in the comprehension of the collaborative form of interstate relationships within the European Union. In this literature, the employment of network-based steering forms, *network governance*, is understood as a response to this increased complexity in power relations and management systems, causing a general shift within western public management

toward networked forms of *governance*. This shift is frequently described as a three-stepped evolution in governing regimes, where new public management (NPM) is understood as an intermediate phase between traditional hierarchical government and the emerging emphasis on network governance (see particularly Osborne 2010).

In sociological terms, the understanding of a shift from government toward networked governance can generally be related to Anthony Giddens's and Ulrich Beck's theories of post-traditional society and reflexive modernity and particularly to Giddens's (1994) descriptions of the diminishing role of the state and Beck's (1992) rise of the risk-based society. These can both be understood as preconditions of public decision-makers surrendering hierarchical government in favor of inclusive network governance as steering tools.

Simplified, it can be argued that in post-traditional society, where individualization and common notions of risk have caused a breakdown of old traditions and cleavages, reflexive modes of steering have not only become possible but also necessary, in steering a state undermined by individualization from below and globalization from above. Flexible modes of steering through trust-based networks and working "with the grain" of market forces have therefore become government's response to steering a public sector – also further fragmented throughout the 1980s and 1990s doctrines of NPM – deemed ungovernable through traditional means (see discussion in Davies 2011). The emergence of network governance thus becomes an expression of a post-traditional and reflexive condition, free from the ossified hierarchical structures associated with traditional government. Within early governance theory, the ideas of the diminishing state along with emergent network steering have been particularly echoed in the influential notions of the "hollow state" (Milward and Provan 2000) and the developing condition of "governing without government" (Rhodes 1997).

The question of whether the notion of network governance represents a qualitatively new approach to public management is met with a certain ambiguity in the literature. Particularly in early, *first wave*, network governance theory, idiomatic phrases emphasizing the novelty of "new" and "emergent" governance arrangements were frequent (e.g., Agranoff and McGuire 2001; Kersbergen and Waarden 2004; Rhodes 1997). As critical voices have later objected, the novelty of present-day governance practices might, however, hinge on a distortion of the past: Governance networks is by no means a new phenomenon, and the interdependence between governmental and nongovernmental actors can be considered axiomatic to any governing system (Davies 2011; Bevir and Rhodes 2010; Sørensen and Torfing 2007).

Most theorists do, however, agree that there has been a change in how networked forms of governance are perceived and understood. While the hand of private interests in public policy decisions, in particular, has previously been viewed with suspicion, networked modes of policy-making involving both private and public actors have increasingly become perceived as both legitimate and effective ways of governing – endorsed by both central decision-makers and academics (Torfing et al. 2012). In his critical analysis of the network governance literature, Jonathan Davies (2011) argues that what is new is the ideological celebration of networks that, from a neo-Marxist viewpoint, can be interpreted as an integral part of a neoliberal hegemonic project. Davies, in his analysis, attributes network theorists themselves a significant role in the emerging emphasis on network governance, arguing that the celebration of networks has become orthodoxy in a dialectic relationship between academic and political discourses.

Through the transformation thesis, governance theory has tended to portray hierarchical *government* as an obsolete form of governing, incapable of managing the complexity of modern society. The emergence of *networked governance* thus becomes both a product of the diminishing *government* and an axiomatic solution for governing the complexity of modern society, providing

*governance* with both normative and deterministic flavors. By accepting the premises of the transformation thesis without exploring its empirical relevance, governance theorists, according to Davies (2011), conform not only to a bias toward networks but also to a bias in how networked interactions are interpreted. As noted by other theorists (see, e.g., Torfing et al. 2012), many of the somewhat exaggerated promises ascribed to network governance in the literature are simple inversions of the problems associated with traditional forms of hierarchical government. In particular, Davies (2011, see also Davies and Spicer 2015) points to how the general understanding of governance networks as egalitarian game-like interactions, rooted in trust and enacted by reflexive participants, seldom seems to comply with empirical realities. Rather, networks can function as vehicles of hegemonic power, reproducing, or even concealing, the hierarchical structures they are presumed to replace.

## Governments Continued Hand in Governance Through Metagovernance

The claim that *governance* is replacing *government* has also been substantially challenged and modified in later literature. Torfing et al. (2012) identify three implicit dangers of such a simplistic narrative of transition: First, it creates an oversimplified picture of a linear development where the government has gone from a state of omnipotence to suddenly being stripped of all its powers. Second, the narrative builds on the problematic assumption that governance can only expand at the cost of hierarchical government. Finally, related to the two arguments above, it seems to deny, or at least obfuscate, governments' role in public governance.

To avoid these pitfalls, more recent governance theory has tended to emphasize government's continued hand in governance. Rather than replacing hierarchical government, network governance is, in this view, understood as a supplement representing a third layer of government alongside hierarchical government and the market regulation introduced by NPM (Osborne 2010; Torfing et al. 2012). Understood as the "governance of governance," *metagovernance* (Jessop 1997; Kooiman 2003) is a central concept within this *second wave* of governance theory.

Metagovernance can be understood as the deliberate attempt to facilitate and manage more or less self-regulating processes of networked governance (Sørensen and Torfing 2007). While some perspectives do acknowledge that other actors may act as such "metagovernors," the role of the state is commonly emphasized. Within the *second wave* of governance literature, concerned with conceptualizing a coexistence and connection between *government* and *governance*, metagovernance is thus applied as an "umbrella concept" in the effort to describe the role of the state and its policy instruments in processes of network governance (Bevir and Rhodes 2010).

The concept of metagovernance enables an alternative to the suggestion that governance is *replacing* government: Through exercising metagovernance, *government* still plays a crucial role in *governance*. In this view, the exercise of network governance also affects government, but not by creating a hollow state. Rather, the exercise of network governance is transforming the overall role and function of the state that is taking upon itself the role of metagovernor in recognition of the limits of unilateral state action (Torfing et al. 2012). Instead of a one-way movement from *government* to *governance*, the idea of transformation becomes a dialectic process of coexistence and transformation between the two. Torfing et al. (2012) argue that this transformation has produced several irreversible changes to the governing of society and economy. Broadly, these changes include that stakeholders now have expectations to become actively involved in policy processes, that public agencies have become relatively "open organizations" involved in collaborative efforts, and that the legitimization of interactive governance has made governance a more reflexive enterprise.

Other theorists have objected against the attempts to provide a single comprehensive account of a general transformation toward network governance, made by both the first and the second "waves" of governance research. Most noticeable, the "decentered" approach developed in a series of publications by Mark Bevir and R. A. W. Rhodes has gained increased momentum in recent years as a *third wave* of governance research (see Bevir and Rhodes 2010; Turnbull 2016). The decentered approach challenges the new institutionalism and the "craving for a generality" (Bevir and Rhodes 2010, 82) they see as characteristic of the earlier waves of governance research. Instead of reducing governance networks and metagovernance to manifestations of (macro)social logic and institutional path dependencies, they develop a decentered approach focusing on the actors' own interpretations of their actions and practices. The proponents of this approach thus advocate a bottom-up approach that investigates how (often contested) beliefs and traditions inform a diversity of governance practices. By doing so the decentered approach explores how the changing nature of the state takes diverse forms, thereby refuting both the "myth" of a monolithic state and the attempts at a single, comprehensive, theory of transformation.

Relatedly, Davies and Spicer (2015) have called for a more inductive and agnostic approach to governance research. The basic premise of their suggested approach is that concrete governing processes involve a synthesized mix of elements of hierarchy, markets, and networks. By inductively treating such categories as inputs (or "building blocks") rather than outcomes or types of institution, a greater diversity of governance configurations in play can be identified (Davies and Spicer 2015). In turn, this enables a more detailed examination of their mechanisms and of the strengths and weaknesses of different governance practices in different contexts.

## Analysis and Conclusions

As outlined above, the notion of "going from government to governance" as presented by the *first wave* of governance theory has been met with substantial critique and modification in more recent work.

In Davies' account of a dialectic relationship between network governance theory and public decision-makers, the question of transformation itself becomes a discussion of whether the dialectics between theory and practice dismisses the theory (Davies 2011, 31–32). While this discussion might seem to be descending into a discussion of the chicken or the egg, the important question posed is rather how the normative implications of the transformation thesis shape not only our understanding of such an alleged transformation but also the practices associated with it.

Importantly, such critique does not necessarily dismiss the idea that governance networks can, in some settings, be efficient and appropriate tools of governance. Nor does it dismiss the useful analytical application of the two concepts as modes of governing. Rather, it questions the assumptions that an incipient post-traditional and reflexive modern condition has rendered traditional structures and modes of government obsolete and that network governance has thus emerged as the only appropriate tool for managing the complexity of modern society. As such, this critique (Davies 2011; Davies and Spicer 2015) addresses the troublesome normative and analytical biases toward networks advocated by the notion of going from *government* to *governance*.

The critique of a normative bias in governance theory is also relevant to the aforementioned reconfiguration of the transformation thesis emphasizing an interplay between *government* and *governance*. While the notion of metagovernance provides an important reminder that the state remains relevant in processes of network governance, proponents of the *second wave* of governance theory accept the basic premise from the *first wave* of governance theory: the claim that the "traditional" tools of hierarchical government

are increasingly being rendered obsolete due to macroenvironmental changes (e.g., Torfing et al. 2012). While the generalizability of the latter claim is debatable, such a comprehensive narrative, of networked governance being propelled by macroenvironmental changes, reproduces the normative and deterministic biases toward networks identified by Davies (2011).

In summary, the debate that has followed the original claims of the transformation thesis provides a substantial warning of the dangers of interpreting a priori all practices of networked governance as manifestations of a general transformation from government to governance. The analytical implication is that the relevancy of the transformation thesis, the relation between different modes of governance, and their nature and desirability need to remain open questions for investigation in each case and context. In this endeavor, bottom-up approaches (e.g., Bevir and Rhodes 2010; Davies and Spicer 2015) may provide a fruitful way to explore how the shifting patterns of governance can take diverse forms.

# Good Budgeting: Design and Development of a Budgeting Model Based on Good Governance Indices in Iran

Heidar Ahmadi
Faculty of Business and Economics, Persian Gulf University, Bushehr, Iran

## Synonyms

Effective budget; Goal-oriented budget

## Definition of Good Budgeting

Achieving good governance and establishing a prudent governmental system has turned into one of the essential goals of communities and

governments. Accomplishing this goal is largely dependent on efficient resource allocation to its respective objectives. Being a tool for efficient allocation of fiscal resources to national policies and programs, the budgeting system of a country is of undeniable gravity. Therefore, we aim to identify and define the components and characteristics of budgeting systems that promote good governance through good budgeting. Components that provide a context for good governance should their modification and adoption be considered in budgeting policymaking.

## Introduction

The complexions of the current era in a variety of social, political, and economic domains have put the factors impacting economic growth and development through transformation and complexions. Political economists count several reasons why economic growth and development can vary significantly on two sides of the same geographical boundary. Firstly, the extent of available resources of the two areas might be different from each other; secondly, the resource management might differ over the boundary; thirdly, the two regions might have different social capital reserves; and finally, the economic and political institutions might be different over the boundary. Apparently, the management manner of the resources available to a nation, the quality and quantity of institutions, and social capital reserves can provide and maintain welfare and prosperity for the nation (Khezri 2008: 41). Thus, the alterations and complexities of the present era highlight the necessity of logical incentives by governments, specifically in terms of proper planning, scientific management and decision making, and coordination of issues regarding communities' requirements. This has put the employment of innovative approaches for budgeting in the public sector, while taking the aforementioned complexities into account, through new challenges since it requires aggregation of data obtained from multiple resources, putting various viewpoints together, and taking various stakeholder groups into account. However, not only do these innovative budgeting approaches prevent the sluggishness of governmental agencies and wasting public properties, but they also perform extremely effectively in advancement of economic and social goals, through which governments can distribute national resources justly and efficiently among the community's favorable goals (Shah 2007: 109). The budgeting system can, therefore, be considered the most significant factor contributing to efficient and effective resource management. The government's budgeting is, in fact, the center of the country's public policymaking and national development vision (Azar and Amirkhani 2011: 40). On the other hand, promoting budgetary efficiency has always been interesting to scholars of this field since budget – as the government's financial expression – is the single most important governmental document helping the executive organizations realize national development programs and vision goals and is, in fact, a mirror reflecting all governmental activities and programs, playing a central part in the national economic development (Cardos 2014: 1167).

On the other hand, there is an international agreement that paying efforts toward achieving good governance is among the most essential objectives of the governments and communities, and the budgeting system bears an undeniable gravity in accomplishing this goal since it is a tool for efficient allocation of fiscal resources to every country's programs and policies. Therefore, paying efforts toward modifying and improving the national budgeting system is essential to achieving good governance. Wildavsky (1978: 502) believes that public budgeting is a procedure through which individuals decide what governments will or will not do, how obtained resources are allocated, and how they are employed to reach the goals. Budgeting is thus both a rational and political process, which means it draws from both economic sciences and political sciences. Therefore, it can certainly be argued that budget is placed at the center of the governance structure of countries, is anything but a mere legal

document, and must reflect every component of good governance (Azar and Amirkhani 2011: 41). Therefore, the important question is what the essential elements of a budgeting system that advocates good governance (good budgeting) are considering the budgeting system's aforementioned functions and the significance of this planning system.

## Good Governance

Good governance is one of the extremely important yet novel concepts introduced to development literature since the 1980s. It has found a specific place in developing countries among aid policies aimed at the establishment and initialization of civil society. Good governance has been introduced aiming to achieve sustainable development through which poverty alleviation, sustainable employment and welfare creation, environment conservation and revitalization, and growth and development of women are highlighted, all of which shall realize through good governance. Although there is a dialogue about good governance in many scientific conversations, it is frequently observed that those using this term mean different things by it. Analyzing governance's concept reveals a vast conceptual domain encompassing every form of governance including corporate governance, local governance, national governance, (the government, civil society, and the private sector), and international governance (Danaeifard et al. 2012: 49; Gowda and Kumar 2013: 83). Governance is not solely about actors or organizations, rather, more importantly, it encompasses the quality of governance measured through dimensions and indicators (Moghimi and Ardakani 2011: 174). The concept of governance has been explored by various international institutions that have each proposed indicators for measuring it including The International Monetary Fund (IMF) focused on the economic dimension, the United Nations (UN) focused on the political dimension, and the World Bank (WB) focused on investment (Hwang 2011: 5).

The World Bank's definition of governance is how the economic management and social resources of a country are implemented to develop its power. Therefore, governance is defined as the institutions and traditions through which national power is enforced seeking public interest. This definition comprises the following three components:

1. A process through which authorities are elected, monitored, and replaced.
2. The government's capability to manage the resources and regulate, establish, and enforce proper regulations and policies efficiently.
3. The respect that government and the citizens have for institutions that regulate the economic and social interactions between them (Kaufmann et al. 2000: 1000).

Further along, a political dimension encompassing characteristics such as governmental legitimacy, governmental accountability, the realization of human rights through law enforcement and governmental merits was added to good governance besides the pre-existing economic dimension. Accordingly, six indicators including political security and absence of violence/terrorism, voice and accountability, government effectiveness, regulatory quality, rule of law, and control of corruption were measured in the World Bank's reports assessing the status of good governance in various countries (World Bank 2007; Kaufmann et al. 1999: 4). Each of the aforementioned indicators was built on several other variables obtained from diverse sources (31 sources). Data regarding governance is obtained through surveying the government, individuals, the private sector, and the civil society (Kaufmann et al. 2010: 4). The World Bank considers bad governance to be the equivalent of personalizing the power, undermining human rights, corruption institutionalization (indigenousness), and unresponsive and illegitimate governments; and naturally considers good governance to be the opposite (Weiss 2000).

## Budgeting

A simple definition of budgeting comprises a systematic method for resource allocation. Budgeting aims to present the fiscal value of the government's programs and objectives, make the procedures measurable, and turn strategic programs into operational plans (Cardos 2014: 483). From a historical perspective, budgeting aims to fund the monitoring responsibilities and, in other words, to ensure parliament rights; but governmental activities have expanded significantly over the course of time and the role of government's budget has become more complex (Allen and Tommasi 2001: 43; Shah 2007: 58). The societal needs and the growing expectations from the government to steer the economic management of the country, directing development programs, and providing relative welfare in addition to taking historical missions on one hand, and adopting favorable fiscal policies for providing the financial resources on the other have turned budgeting into a tool for managing national affairs or developing fiscal policies to address social and economic issues, and its outcomes regarding public sector responsibilities have surpassed the temporal and fiscal boundaries of traditional budgeting.

Various types of budgeting systems are used to achieve various objectives such as fiscal control, managing, prioritizing, and planning for scarce resources and responsiveness in using public resources, coordination in organizational activities, resource allocation, and adjusting to the social norms; these objectives also include fiscal control, determining priorities, government accountability, effectiveness and efficiency, economic planning and management, and political tools (Wilson et al. 2001: 4). Thus, governments clearly employ the budgeting tools to realize their annual objectives in proportion to their size and economic role. Considering that the public budget is developed by the government and ratified by the legislative power, it can be considered as parliament's leverage used for guiding political, social, and economic affairs as well as satisfying the voters and taxpayers. Therefore, it becomes obvious that the budget is closely intertwined with national governance.

## Good Budgeting

Public finance and budgeting theories used to be founded on the simple and generalizable presumption that maximizing the public interest is the sole mission of the governments. The national government's structure was not paid much attention to this point of view, and no clear definition was provided regarding what public interest is and what measures should be taken to maximize it. Analyses regarding issues such as the theoretical contexts of governments' origins, evaluation of election principles, and public finance and budgeting policies underwent transformations along with the development of political concepts and the transformation of governmental structures. The modification aimed to achieve good governance through making government's activities transparent and establishing monitoring frameworks to fight corruption and rent-seeking, whose operational measures are confined to taking technical measures or budget ratification and enforcement, Treasury institutional reformation, promoting public resource management and establishing effective audit procedures.

The United Nations' publications, works of Walters and Watterson, and other credible documents point out the shortcomings and imperfections of the budgeting organizations of underdeveloped countries, and many articles addressing development programs also point out these issues and a great majority of them suggest that the resolving of these issues is highly dependent on the rule of logic and the incentive system of the national administrative system. This is while many developing countries are suffering from unfavorable and usually dysfunctional governance organizations involved in rents, breaking the law, and poor public services. To resolve these issues, development assistance communities in general and the World Bank in particular, have taken measures to achieve better methods for

doing what must be done and preventing what must be refrained from to improve governance, one of these methods of modifications and improvements is related to the budgeting systems (Shah 2007: xvii).

A sound budgeting system is one through which the government gains the trust of the citizens through hearing their concerns, planning for the accomplishment of their favored goals, and using resources effectively and efficiently in the right time and place, and budget governance addresses the procedures, regulations, structures, and institutions through whom a sustainable and cohesive budgeting system can realize the aforementioned objectives. In this regard, good budgeting must encompass all the characteristics of general good governance such as cohesion, transparency, participation, responsiveness, and a strategic approach to plan for and attain national goals. Therefore, budgeting is an essential factor contributing to trust being built between a government and its citizens (OECD 2014: 1). It can be inferred from the aforementioned that modification of the budgeting system can, in fact, result in improvement of good governance indicators since there is a belief that while the budgeting system might not be a direct tool for accomplishing every goal, financing the resources required for all programs and objectives including achievement of good governance is accomplished through the budgeting system (Lytvynchenko 2014: 577) and it would be safe to claim that the public expenditure management system can both influence and be influenced by the general atmosphere of a country's governance (Shah 2007: 57).

This relationship which is claimed to exist between the budgeting system and good governance has been explored by the present research, and a two-way relationship was observed between good governance and good budgeting (Egbide and Agbude 2012: 55). In confirmation of the budget quality's influence on the quality of good governance, some scholars also believe that good governance is essentially comprised of the budgeting process management, and governance goals will not be realized if the budget is not well prepared, regulated, ratified, enforced, and monitored. Governmental institutions require good budgeting for resource allocation; a budgeting system that works under the rule of law has a cohesive accounting system in addition to an auditing system ensuring the quality of financial and information organizations. Besides, a good budgeting system must include financial resources and assets that are managed transparently and responsively, moving toward national and macrolevel interests (Osisioma 2013: 5). Also, since the budgeting process has an effective relationship with other governmental activities such as planning and management, it contributes to quality improvement of financial decisions and programs and results in improved governmental performance. A process that includes all stakeholders such as the elected authorities, public affairs actors, employees, and their representatives, citizen groups, NGOs, business owners, etc., and reflects and covers the needs of all groups contributes to the improvement of the relationships between the government, the citizens, and other social actors, which will eventually realize good governance (National Advisory Council on State and Local Budget 1999: 2). This means the higher the quality of the budgeting process is, the higher the quality of good governance will be. In this regard, scholars believe that good governance entails improvements in all the aspects of the public sector including the institutions regulating the rules of the game for economic and political interaction, decision-making structures responsible for determining the priority of issues and allocating resources to them, organizations managing the administrative system of providing the citizens with goods and services, the human resources of the state bureaucracy, the interaction and confrontation of citizens and governmental authorities in bureaucracy and political domains (Huque 2013: 399).

Therefore, as mentioned earlier, there is a mutual relationship between good governance and budgeting, to an extent that some scholars believe budgeting to be a part of politics and governance if the politics are defined as "who attains what, how and when" since the resource allocation process fits exactly in the framework of

this definition. Good budgeting cannot be imagined in the absence of good governance and vice versa since the development of good governance is the premise of achieving good budgeting, and good budgeting can, in turn, improve the quality of good governance. Therefore, if a government claims to have good governance, its budgeting system can determine whether or not this claim is true. For instance, the most essential properties of good governance, which were mentioned earlier, include efficiency, effectiveness, transparency, responsiveness, and discipline, all of which are also characteristics of good governance and establish values for the citizens (Egbide and Agbude 2012: 55) (Fig. 1).

To achieve this goal and realize good governance through modification of the budgeting process, the budgeting system must be designed rationally and transparently, offering equal voice and participation to citizens, monitoring the orientations of the representatives, and being accountable in terms of performance. Medium-term expenditure frameworks and operational budgeting are embedded in the rational budgeting paradigm to reach this end and are currently being employed by many countries (Radin 1998: 309).

Additionally, according to a research conducted in Iran by Moghimi and his colleagues (2017), the ground for good budgeting will be achieved if spatial planning and justice are addressed in the budgeting system, the political structures are modified and the management structure is decentralized, budgeting rules and regulations are prepared and approved aiming to realize good governance, the entire budgeting process is made transparent, and stakeholder management is executed properly.

# Good Governance

Md. Shafiul Islam
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Fair governance; Sound governance

## Definition

Good governance is such governance where everything is managed by rules and regulations and also it is run fairly.

## Introduction

Governance is not a new concept to this present world. It was present in the ancient society where there was no concept of State. That means governance is a process to run or manage something. In the primitive age, people lived in a group. They were moving from one place to another for living. For this, they prefer hunting animals, collecting fruits, and so on. There was governance. The activities were run with the guidance of a leader. He/she defines division of labor. Male people were selected for hunting animals and colleting fruits from forest on one hand. Female were selected for less hard working jobs on the other hand. They lived in a community. It was continued and governance process was also changing. With the growth of population, community flourished. In the meantime, Monarchy was established. People were being governed by rulers. Trend in governance process was being changed. With the emergence of civilization, the living style of people was also being changed. It further brought changes in governance system as well. With the passage of time, people entered into a new era of invention. They invented many new instruments for improvement of living standard. Invention of "steam engine" was one of the great inventions. Time does fly fast. People entered in modern society with the embedded modern facilities, improving management system in daily life. People again entered into the era of modern technology, improving quality of management in the managerial tasks from local administration to central administration of a country. It also brought changes in quality of life. Now people are living in the era of super information and communication technology. As invention brings changes in life, it also brings changes in running or managing administration. Therefore, governance process has become a burning issue around the present world. Academics and practitioners are of opinion that prevailing governance system is not fair enough for development as well as management of a country. Despite controversy or lack of uniformity among them, they are of the opinion of good governance.

## Governance

The concept of "governance" is not new. It is as old as human civilization. Simply governance means: the process of decision-making and the process by which decisions are implemented (or not implemented). Governance can be used in several contexts such as, corporate governance, institutional governance, national governance, and local governance.

It is considered that governance is the process of decision-making and the process by which decisions are implemented, an analysis of governance focuses on the formal and informal actors, involved in decision-making and implementing the decisions made and the formal and informal structures that have been set in place to arrive at and implemented the decision. Government is one of the actors in governance. Other actors involved in governance vary depending on the level of governance that is under discussion.

According to World Bank, governance is a method through which power is exercised in the management of a country's political, economic, and social resources for development (World Bank 1992: 1).

The United Nations Development Program's (UNDP) definition of good governance is set out in a 1997 UNDP policy document entitled "Governance for Sustainable Human Development." The document states that governance can be seen as the exercise of economic, political, and administrative authority to manage a country's affairs at all levels.

It is explained that governance has three dimensions: economic, political, and administrative. Economic governance includes the decision-making processes that affect a country's economic activities and its relationships with other economies. Political governance is the process of decision-making to formulate policy. Administrative governance is the system of policy implementation.

## Good Governance

The term "governance" has received extra flavor in the current discourse of development in developing countries by having the term "good" added to it. "Good Governance" entered the vocabulary of development administration and international development cooperation in the 1990s.

In the report titled "Sub-Saharan Africa: From Crisis to Sustainable Growth" published by World Bank (WB) in 1989, the term "good governance" first appeared in the development arena. Since then, good governance is a much discussed issue. But it lacks clear definition. International Development agencies see it in one way whereas academicians describe it in other ways. There is no universally accepted definition of good governance.

After 3 years of emergence of good governance, WB further in its report titled "*Governance and Development*" published in 1992 developed the concept of good governance elaborately. According to the Bank, good governance requires: (a) sound public sector management (efficiency, effectiveness, and economy); (b) accountability; (c) exchange and free flow of information (transparency); and (d) legal framework for development (justice, respect for human rights, and liberties). Another international development agency DFID defines good governance focusing on: (a) legitimacy (government should have the consent of the governed); (b) accountability (ensuring transparency, being answerable for actions, and media freedom); (c) competence (effective policy making, implementation, and service delivery); and (d) respect for law and human rights. So, it assures that corruption is minimized, the views of minorities are taken into account, and that the voices of the most vulnerable in society are heard in decision-making. It is also responsive to the present and future needs of society.

According to UNESCAP, good governance has eight major characteristics. It is participatory, consensus oriented, accountable, transparent, responsive, effective and efficient, equitable and inclusive, and follows the rule of law.

In a policy paper titled "Governance: Sound Development Management," Asian Development Bank (1995) outlined its policy on this topic. Good governance is defined as "the manner in which power is exercised in the management of a country's economic and social resources for development."

In a study, the WB presented six dimensions of good governance: voice and accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption (Kaufmann et al. 2005). These six indicators of good governance are:

- Voice and Accountability – "captures perceptions of the extent to which a country's citizens are able to participate in selecting their government as well as freedom of expression, freedom of association and a free media."
- Political Stability and Absence of Violence – "captures the perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, politically motivated violence and terrorism."
- Government Effectiveness – "capturing perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and the credibility of government's commitment to such policies."
- Regulatory Quality – "capturing perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development."
- Rule of Law – "captures perceptions of the extent to which agents have confidence in and abide by the rules of the society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence."
- Control of Corruption – "capturing perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as 'capture' of the state by elites and private interests" (Kaufmann et al. cited in Khan 2012).

Actually there is no universally accepted definition of good governance. As Andrews (2008) rightly says, "it means different things in different countries."

There are major divergences between the concept "governance" which was propounded in the academic world during last four decades and the concept of "good governance" championed by the World Bank and other development agencies. The academic concept of "governance" is positive while "good governance" is a normative concept. The concept of governance emphasizes "the hollowing of state" and "third party government" or "governing without government." The proponents of good governance, on the other hand, are advocates of stronger and more effective states (Khan 2012).

In general, good governance is associated with efficient and effective administration in a democratic framework. It is equivalent to purposive and development-oriented administration, which is committed to improving the quality of life of the people and enlarging the scope of people's participation in the decision-making process of development. In short, it is citizen-friendly, citizen caring, responsive, decentralized local government system, an autonomous political society, an efficient and accountable bureaucracy, strong civil society, and a free media.

Overall, there is a growing consensus that governance is important to development and that governance is likely to have an impact on how well and effectively policies are being exercised.

## Elements of Good Governance

Different international agencies and scholars set a number of elements for good governance. Some of the elements are discussed below. According to the World Bank (1994) report titled "Governance: The World Bank's Experience," there are four different aspects for good governance. These are:

(a) Public sector management. This is the most readily identified dimension of the World Bank's governance work. The language of public sector management is predominantly technical, changing the organizational structure of a sector agency to reflect new objectives, making budgets work better, sharpening civil service objectives, and placing public-enterprise managers under performance contracts.

(b) Accountability. Governments and their employees should be held responsible for their actions.
(c) Legal framework for development. Appropriate legal systems should be created that provide stability and predictability, which are the essential elements in creating an economic environment in which business risks may be rationally assessed.
(d) Transparency and information. The themes of transparency and information pervade good governance and reinforce accountability. Access to information for the various players in the market is essential to a competitive market economy.

According to United Nations Development Program (UNDP), good governance comprises the existence of effective mechanisms, processes, and institutions through which citizens and groups articulate their interests, exercise their legal rights, meet their obligations, and mediate their differences. Its essential characteristics are:

(a) Participation. All men and women should have a voice in decision-making, either directly or through legitimate intermediate institutions that represent their interests. Such broad participation is built on freedom of association and speech, as well as on the capacity to participate constructively.
(b) Rule of law. Legal frameworks should be fair and enforced impartially, particularly the laws on human rights.
(c) Transparency. This concept is built on the free flow of information. Processes, institutions, and information should be directly accessible to those concerned, and enough information should be provided to render them understandable and monitorable.
(d) Responsiveness. Institutions and processes should serve all stakeholders.
(e) Consensus orientation. Good governance should mediate differing interests in order to reach broad consensus on the best interests of the group and, where possible, on policies and procedures.
(f) Equity. All men and women should have equal opportunity to maintain or improve their well-being.
(g) Effectiveness and efficiency. Processes and institutions should produce results that meet needs while making the best use of resources.
(h) Accountability. Decision-makers in government, the private sector, and civil society organizations should be accountable to the public as well as to institutional stakeholders. This accountability differs depending on the organization and whether the decision is internal or external to an organization.
(i) Strategic vision. Leaders and the public should have a broad and long-term perspective on good governance and human development, together with a sense of what is needed for such development. There should also be an understanding of the historical, cultural, and social complexities in which that perspective is grounded.

The ADB has identified four basic elements of good governance. These are:

(a) Accountability. Public officials should be answerable for government behavior and responsive to the entity from which they derive authority. The accountability of public sector institutions is facilitated by evaluation of their economic performance. The suggested specific areas of action would be in the building of government capacity through, for example, public sector management, public-enterprise management and reform, public financial management, and civil service reform.
(b) Participation. Government structures should be flexible enough to offer beneficiaries and others affected the opportunity to improve the design and implementation of public programs and projects. The specific areas of action would be in the development of participatory development processes through, for example, participation of beneficiaries, a public/private sector interface, decentralization/empowerment of local government, and cooperation with non-governmental organizations (NGOs).

(c) Predictability. Laws and policies should exist that regulate society and that are applied fairly and consistently. Predictability requires the state and its subsidiary agencies to be bound by and answerable to the legal system in the same way as private enterprises and individuals. The specific area of action could be the development of predictable legal frameworks for private sector development.
(d) Transparency. Information should be made available to the general public and there should be clarity as to rules and regulations. Access to timely information on the economy can be vital to economic decision-making by the private sector and can also serve to inhibit corruption.

All the above elements are interlinked, and mutually supportive and reinforcing. Accountability is often related to participation and is also the ultimate safeguard of predictability. Transparency and predictability in the functioning of a legal framework would serve to ensure the accountability of public institutions.

On the other hand, International Development Agency (IDA) contains six elements of good governance. These are: (a) sustainability of structural reforms, (b) property rights and rule-based governance, (c) quality of budget and public investment process, (d) efficiency and equity of revenue mobilization, (e) efficiency and equity of public expenditures, and (f) accountability and transparency of the public service.

However, the four major pillars against which governance can be judged are stated to be:

(a) Accountability. At the macrolevel this includes financial accountability, in terms of an effective, transparent, and publicly accountable system for expenditure control and cash management, and an external audit system. It encompasses sound fiscal choices, made in a transparent manner, that give priority to productive social programs – such as basic health services and primary education vital to improving the living standards of the poor and promoting economic development – over nonproductive expenditures, such as military spending. At the microlevel it requires that managers of implementing and parastatal agencies be accountable for operational efficiency. Auditing systems should meet international standards and be open to public scrutiny.
(b) Transparency. Private sector investment decisions depend on public knowledge of the government's policies and confidence in its intentions, as well as in the information provided by the government on economic and market conditions. Transparency of decision-making, particularly in budget, regulatory, and procurement processes, is also critical to the effectiveness of resource use and the reduction of corruption and waste.
(c) The rule of law. A fair, predictable, and stable legal framework is essential so that businesses and individuals may assess economic opportunities and act on them without fear of arbitrary interference or expropriation. This requires that the rules be known in advance, that they be actually in force and applied consistently and fairly, that conflicts be resolvable by an independent judicial system, and that procedures for amending and repealing the rules exist and are publicly known.
(d) Participation. Good governance requires that civil society has the opportunity to participate during the formulation of development strategies and that directly affected communities and groups should be able to participate in the design and implementation of programs and projects. Even where projects have a secondary impact on particular localities or population groups, there should be a consultation process that takes their views into account. This aspect of governance is an essential element in securing commitment and support for projects and enhancing the quality of their implementation.

## General Discussion About Governance and Good Governance

The foregoing discussion makes us clear that governance is not a new concept to present world. We find that it was in ancient society and also in

present day. But there are many differences, we find, in practice of governance between ancient society and present society. For example, one matter which was exercised traditionally in ancient society is exercised scientifically in present society.

Development practitioners, researchers, and academics argue that it happens due to invention of technology. But it is believed that there is another important factor which is "religious belief" in the practice of governance. It is also firmly believed that no religion teaches to "tell a lie." It is considered that in many cases corruption, mismanagement, lack of accountability, and transparency, which are deemed as important factors for good governance, happen due to greed and telling lie. So, practice of good governance will be easy if religious norms and values are exercised in daily life as well as in every day works.

## Conclusion

Basically governance consists of many factors and actors especially traditions and institutions by which authority and power in a country is materialized. As governance consists of many things, it needs a sound process by which everything or a decision is implemented properly. But in many cases loopholes and mismanagement become a common phenomenon in implementing the decisions in every day works. Then it urgently needs good practices of doing these every day works. Good practices require good indicators that can be measured whether it is good or not. These indicators should be judged in different ways in different context. However, good practice is labeled as good governance. Therefore, good governance is now a common phenomenon in development arena. It is required not only in project management but also in running administration smoothly. It is perceived that if the norms of good governance are materialized properly, people will be benefitted and ultimately the desired goals will be achieved.

Now the question is: Is it possible to materialize all perceived components of good governance to all countries all over the world? The answer is "no." More clearly and elaborately we can get the answer from the statement of Gisselquist (2012) as he pointed out that good governance "means different things to different organizations and different actors within these organizations." So, it can be said that perception or indicators or components (what we say) of good governance can be found differently in different countries all over the country. For example, one of the indicators of good governance may be exercised as "good governance"in developing countries which is exercised normally in developed countries. More specifically, such as Rule of Law, it is no matter in developed countries like USA, UK, etc. It is well perceived and established that everybody has confidence in and abide by the rules of the society. But it is a matter in developing or least developing countries. Nobody has the confidence to get equal treatment although there is rule of law in paper.

Finally, it can be said that good governance is many things in many countries due to context, geographical location, norms, values, education, and so on. Therefore, practice of religious norms and values in many cases can contribute to make good governance fruitful in present society.

### Definition

**Governance** "The manner in which power is exercised in the management of a country's economic and social resources for development" (World Bank 1992).

**Good governance** There is a common agreement on the following key-elements of good governance; those are accountability, transparency, combatting corruption, participatory governance, an enabling legal and judicial framework (Sam Agere 2000).

**Sound governance** An alternative theory or concept of governance, it takes into consideration the social dimension, it includes the normative, the technical and rational features of governance, as well as new dimensions such us complexity, diversity, and tension. It is mainly based on administrative policy and innovation (Farazmand 2004, 2017).

**Capacity development** "The enhancement of the competency of the range of social actors to engage in activities in a sustainable manner for positive development impacts such as poverty reduction, improvements in governance quality or meeting the millennium development goals" (Kempe 2009).

**Revolution – Tunisia** (17 December 2010–14 January 2011) This revolution is considered to be essentially nonviolent. The explosion of anger is framed by deep regional inequalities and disparities in development that feed a sense of injustice and humiliation experienced by the economically, socially, and politically discriminated subproletariat in the interior regions of the country.

**Change management** It's the approach that prepares, coaches, and supports individual and organization to achieve an

G

organizational change in such highly competitive and continuously evolving environment (Vandangeon-Derumez et al. 2018).

**Agent of change** The person who operates the change. Principally, it is someone who contributes in putting into practice a policy of change in an organization.

**Corruption** Corruption is unfair behavior by those in positions of power, such as managers or government officials.

**Reform** Make change in something in order to improve it. Usually, reforms are structural actions operated in a long-term process. They could cover the political, the economic, the social and the administrative system.

## Introduction

Since its independence, Tunisia has reshuffled its governance system throughout several structural reforms, in economic, social, political, and administrative paths.

These reforms aim to reshuffle governance, in a good and sound manner towards a country political, economic and administrative profiles reforming. Despite a political ideology showing a socialist background through the labor union leading position in the political scene, the elites' governing ideology did not lose the globalization compass toward an opening economy – in fine leading to 2011 revolution under the request of dignity, democracy, and work slogans.

After the revolution, Tunisia has adopted profound political, social, and economic reforms, the constitution of 2014; naturally these changes should impact positively Tunisians' well-being.

It should also be recalled that one of the main demands of Tunisians during the revolution was to fight corruption by establishing good governance in all areas. Thus, Tunisia has plummeted in the globalization agenda of good – bad and ugly governance thesis.

In the same vein, governance reforms, presenting a historical issue since the ancient time, are continuously under criticism (Setyadiharja et al. 2017); for instance, the Tanzanian President Julius K. Neyerere, before the UN Conference in Africa in 1998, said that "good-governance is no more than imperialist and colonialist, good-governance will only degrade the structure of developing countries, while the world's law enforcement business is getting bigger."

Referring to literature on governance concept, (Assaduzzamen and Virtanen 2016) proposed an analytical re-reading pf the literature, an alternative concept or theory of "sound governance" (see Professor A. Farazmand works) has grown; simply sound governance concept is more comprehensive than good governance, it includes the normative as well as technical and rational features of governance.

While good governance approach focuses on promoting good governance principles under the capitalism agenda, sound governance focuses on targeting results with a large vision to stakeholders by adding the global actors, especially by giving more attention to the social reality and to the global context through new dimensions, i.e., diversity, complexity, and tension (Farazmand 2017).

This conceptual blur leads, especially a developing country, to reconsider them reforms agenda especially in a global period characterized by the global pandemic, Covid-19, a recession tendency of the global economy, a global financial system under tension, and a high social expectation.

In fine, Tunisia has adopted the goal of achieving good governance to promote the Tunisians' well-being; this requires the will and the capacity to take actions, to implement measures and policies, and principally to promote good governance principles. This depends on the capacity of the legal and institutional framework to implement these policies. Capacity development has become

recognized as underpinning a number of critical prerequisites for sustaining development in the South (developing country, for example). High on the list of those prerequisites is good governance, without which the quest for development is a fruitless goal (Kempe 2009).

To sum up, according to Farazmand, sound governance is a concept covering an increasingly global complexity, challenges, threats, and opportunities that will affect a nation state, local government, citizens, organizations, and systems of administration. The key to all these elements is administrative policy and innovation.

Meanwhile, the public administration, the private sector, and the civil society in Tunisia work on creating a dynamic around the objective of promoting good governance principles. This was supported by the creation of the International Academy of Good Governance in the National School of Administration of Tunis.

The question to answer is: what type of governance to adopt in Tunisia in such complex national and international environments? Answering this question gives a conceptual delimitation to the governance system in Tunisia, whether it is good, bad, ugly, or even a sound or sick one . . .

In the following, the entry gives a comprehensive picture about the Tunisian administrative system in relation to the promotion of good governance principles. Moreover, it highlights a specific experience launched as a training academy for civil servants, public sector, and civil society as Agents of Change to conceptualize Projects of Change and follow up its implementation. Since the ultimate objective of this Academy is to impact positively the citizen's life via public services quality, this entry proposes some recommendations after an assessment conducted based on OECD/DAC criteria.

The first part analyzes the good governance promotion environments in Tunisia especially according to the entities related to the field. Then, there is a presentation of the Tunisian-German project of cooperation named "The International Academy of Good Governance" (IAGG). Finally, the entry gives recommendations and perspectives to support the Academy project throughout an assessment based on OECD/DAC criteria.

## Tunisian Administrative System, Good Governance Promotion

After the 2011 revolution, **Tunisia** adopted a pack of policies to promote good governance principles and to fight corruption.

In fact, the new **constitution of 2014** comprises principles and rules to achieve good governance. As found in the preamble of the constitution, the objective is to build a republican, democratic, and participatory system in conformity with the principles of pluralism, an impartial administration, and good governance.

In the same way, several measures have been taken especially in the legal framework and institutional framework. The legal framework in relation to good governance has taken an exponential trend, may be in relation to a new mindset calling for a better management of public affairs and anti-corruption.

Reciprocally, and since the independence, Tunisia established a number of institutions to achieve good governance. Some of them are in charge of designing, setting-up, control, and auditing. Besides, Tunisia has adopted tens of systems and processes to achieve good governance, namely, the e-government through website, e-platform, e-purchasing, and e-payment, also open government through open-data and new local governance paradigm via participation in the decision-making process, i.e., participative budget, e-participation platform, e-people, and so on. . .

To sum up, the Tunisian governance system consists of a number of laws, institutions, systems, and processes in charge of achieving a certain number of fundamental principles of good governance.

Actually, the main missions played by each institution in promoting the principles of good governance in Tunisia are listed as follows: Training and Awareness, Design and conception,

Executive and implementation, Legislative, Control and jurisdiction, Regulation and reinforcement.

To accomplish these missions, these various organizations use the following mechanisms: training and sensitization, designing laws, regulations and codes, monitoring, evaluation, mediation, regulation, and Jurisdictions.

Regarding the main principles that organizations promoted, these entities mainly promote the following principles: Integrity, Transparency, Accountability, Participation, and Impartiality.

As a matter of fact, the entry chapter propose the Tunisian mapping for entities involved in good governance public policies (GGPP) by structures typology (missions). These policies are oriented to the citizen; so to plot the result's chain and to highlight the implementation process of GGPP in Tunisia, the following figure presents a comprehensive and fair image about these entities, by mission and its interactions (Fig. 1).

Moreover, the literature review shows that the lack of good governance has been demonstrated to have corrosive effects on the development process. **Tunisia currently lacks the capacity**, as opposed to the will, to achieve and sustain a climate of good governance (Steinich et al. 2017).

Thus, the public administration in Tunisia needs structural reforms. It's Elites claim better allocation of human and financial resources, innovative procedures, and mechanisms via an innovative meritocracy system.

This is a national demand and it needs a national reform program in accordance in fine with citizens' aspirations. Lastly, bureaucracy is on the top five of the most blamed concept in Tunisia. Actually, this was supported by a capitalism agenda in Tunisia and elsewhere, targeting a wider crop filed.

According to Farazmand (2017), in a paper about governance reforms, it is a hypocrisy to claim democracy and governance without bureaucracy, it is needed by all parties, it is a machinery of government and governance – both public and private – and it is also a central instrument of rule and control as an organization of power, a conduit of exercising power in governance – all forms – and administration in capitalism and socialism. "Bureaucracy is the most effective instrument of power" by both Karl Marx (1966) and Max Weber (1947, 1984).

**Good Governance, Building Capacity in Post Revolution, Fig. 1** Cartography of relation between involved institutions in good governance public policies in Tunisia

To sum up, bureaucracy is the effective instrument to all forms of Sound governance systems. Nevertheless, an effective instrument needs capacity, competence, knowledge, and so on.

Capacity building is much more than improving the abilities and skills of individuals. It is more than simply training, mentoring, or organizational restructuring; it is also about strengthening the performance capabilities of individuals, organizations, and societies.

For a similar purpose, the Tunisian government created **the International Academy of Good Governance (IAGG).**

The decree no. 2013-3803 dated 17 September 2013 established and organized the IAGG of Tunis. This decree was repealed and replaced by the decree no. 2014-4568 dated 31 December 2014, fixing the administrative and financial organization of the **National School of Administration (ENA)**.

## The International Academy of Good Governance, Building Capacities

Earlier, in 2012, after the revolution, Tunisia had started a profound transition. The transition should lead to the rule of law based on freedom, democracy as well as a regional and social equal economic development.

These structural reforms depend on the will and the ability of all decision makers and actors to enforce the process and the responsibility of citizens to support this process.

The idea of founding the IAGG was to initiate practitioners from the Tunisian administrative and related sectors in the concepts and methods of democratic governance following the international standards, as well as giving them a practical view of good practices in Germany.

Indeed, trainees found, once back to their offices, the same old dysfunctional structures and procedures. They simply were unable in these conditions to realize what they had learnt.

So, for the German partner and the Tunisian Government, it was clear that it was necessary to readjust the conception of the project. The objective enlarged from achieving changes at the level of the knowledge and competencies of people to a level of the so-called "collective brain" of organization these people were working in.

In addition, the services of good governance at the Presidency of Government (Tunisia) expected that the project should continue to profit to a good number of people working in the Tunisian administration and that the Academy should be located henceforth in Tunisia.

This first phase of the project from January 2012 to December 2014 called "Tunisian-German Academy of Good Governance" was executed by the European Academy of Berlin and financed by the German Foreign Affairs (Transformation partnership program).

Finally, the decision was taken in favor to host the academy at the National School of Administration.

### The Vision – The Main Mission

The vision of the International Academy of Good Governance as announced is:

> A performing and a cooperative administration, at the service of the citizens.

Specifically, a performing participation in building a responsible culture of governance and the spreading of public management good practices, through the organization of training sessions, with the objective that participants gain new knowledge and competencies and be used to governance terms, rules, ethics. Its principal role is to reinforce good practices and to limit corruption and bad governance.

This vision is based on rules, systems, references, procedures, and performing mechanisms, which help to improve the administration capacity and its quality.

The general mission of the academy is to support the Tunisian Government reforms in the area of good governance.

In terms of being specific, Article 26 second (new) of the Decree 2007-1885 as modified by the Decree 2014-4568 states:

> The International Academy of Good Governance is in charge of reinforcing and developing the capacities of high officials of the administration, at the

G

central, regional, and local levels, within the framework of conventions of international cooperation with foreign institutions and countries relating to support of good governance.

### Attributions

The academy does not deliver classic training programs. The ultimate purpose of the academy is to train. The Agents of change are trained and coached to put into practice what they learn once they are back in their offices. They also propose a number of Projects of change. The chosen Projects of change will be implemented by the administration while the follow-up is ensured by the Academy. It should ensure its implementation with the appropriate stakeholders and then its evaluation.

The attributions of the IAGG could be resumed in three main strategic axes: Training – Follow up, Research – Innovation, and Partnership – Cooperation.

### Structure

The IAGG shall be run by a high official whose rank and advantages are similar to those of director or general director of central administration.

A scientific committee is created within the IAGG. Its competence consists mainly in:

- Fixing the programs of training, research, and studies
- Giving its opinion regarding the policy of the academy and any cooperation agreement with the different parties

The IAGG comprises (Fig. 2):

**Good Governance, Building Capacity in Post Revolution, Fig. 2** IAGG organization

## The International Academy of Good Governance

### Toward Sound Governance in Tunisia

The assessment of the Academy project (Gallala and Soukni 2019), using the DAC principles for the evaluation of development assistance (OECD 1991), leads to a comprehensive analysis based on the following criteria: Relevance, Effectiveness, Efficiency, and Sustainability.

Using a participative approach via interviews with high civil servants in the top management positions at the Tunisian Administration and private sector in relation with the Academy project, the assessment lists a number of factors that have an important impact on the project.

The **scientific committee** is a source of sustainability for the Academy's project through its representativeness of the public administration in its highest decision-making positions, the private sector and especially civil society.

There is a high level of **appropriation** both in the ENA and in its authority of supervision through the assessments. The appropriation of the project reinforces its **sustainability**.

The choice of **local experts** by remunerations that are not up to the international range could affect the sustainability of the project. It was a choice of sustainability from the beginning to **set up a group of national experts** in the field. This will promote development even if the partner stops providing financial support.

According to the competitiveness rule, it is difficult to attract the right experts in change management or other disciplines with remunerations that are not adequate with the profile. This limit is difficult to overcome.

The use of new methods, i.e., the DSM (**new Dynamic Systems Methods**), makes the project more sustainable since it fuels the reputation of the Academy.

There are also many limits, the most important ones are as follows:

- There is a **lack of communication** about the project, especially to the general public.

**Good Governance, Building Capacity in Post Revolution, Table 1** A matrix summarizing the recommendations

| Criteria | Recommendations |
|---|---|
| Relevance | The elaboration of a development strategy |
| | The orientation toward corporate governance theme in training |
| | The creation of a good governance magazine by the Academy |
| | A steering committee to manage and to follow up Projects of Change implementation |
| | A selection list criteria for Projects of Change |
| Effectiveness | The clarification of the Scientific Committee attributions and composition |
| | A detailed list contact of the alumni members |
| | A dashboard for strategic axes monitoring |
| | A process of dashboard feeding |
| | The training target implication, by a symbolic contribution at training fees and a bonus system depending on attendance |
| | A monitoring dashboard for Projects of Change implementation |
| | Electronic system management (ECM) for better access to information in training |
| Efficiency | The exchange of financial data should be carried out using ECM library |
| | A training cost formulae has to be adopted |
| | The follow up of tasks could be carried out using ECM |
| Sustainability | A communication role to be assumed by the Scientific Committee |
| | Capacity building for Academy managers |
| | Alumni involvement in the implementation process of the Projects of Change |
| | Financial perspectives |
| | A detailed list of experts by theme assumed |

- There may be a **funding problem** with the end of the Academy support project now being funded by the donor.
- The change of cultures must be accompanied by efforts to orient toward **the new generations.**

Hereafter, a summary matrix presenting the final recommendations (Table 1):

Regarding these recommendations, it is relevant to adopt a package of operational actions to support the management of the IAGG. Even more, it is important to propose axes to amelioration throughout system critics.

Eventually, it is important to highlights the archaic system of building capacity in the Tunisian Administration, which needs structural reforms via a vertical and a horizontal learning view. This refers to a new perspective called by the author a "T" perspective. This is about a feedback system oriented horizontally and vertically to best practices across the country, the region, and even globally. A sound learning process shared with all stakeholders involved in the objective of overcoming cultural, social, and economic inequalities.

## Outlooks and Insights - Innovation

Since the revolution of 2011, Tunisian citizens claim social equality, prosperity via purchasing power consolidation and so on. This needs an economic and social capacity of governance and government systems to answer its citizens' aspirations, even political will and capacity. The will and the capacity need structural reforms in accordance to all stakeholders, national and international stakeholders, policies, orientations, and aspirations.

Thus, a national dialogue is proposed as the solution to the political, economic, and social crises that Tunisia sails through since the revolution.

Hence, Tunisia has adopted a social and economic council of dialogue where the government, trade unions structures, employer union, and the civil society sit in order to propose solution to all conflicts of interest regarding public policies and structural reforms.

Could Tunisia escape time? Could Tunisia make up for it?

Beyond ideology, the reshuffle of the Tunisian governance model needs a pragmatic approach. Indeed, Tunisia needs the will and the capacity to invent a comprehensive vision, in which sound governance could play the role of the neo-governance system in the country based on the couple: innovation – moral values.

## Conclusion

This entry concludes that this Academy project presents a strategic scope in the process of promoting the culture of a sound governance in Tunisia with regard to democracy and accountability. However, to guarantee the continuity of the project and above all to focus on the ultimate beneficiary, the citizen, a development strategy must be put in place in line with the Tunisian institutional framework without losing the compass.

The proper orientation of public policies toward the aspiration of the citizen depends on the performance of the process of implementing these policies. In a program management approach, it is therefore necessary to value the monitoring and evaluation phase of the program to ensure flexibility in intervention and reorientation if necessary.

Eventually, it is important to underline the importance of building capacity in the public administration to achieve good governance climate and to positively impact the administrative governance system.

To buckle this entry, the governance system recovery depends on innovative system and administrative policies oriented to citizens' aspirations and according to stakeholders' orientation.

## Definition

Governance refers to the formation of policies and continuous monitoring to implement them properly by the governing body. It is the decision-making process by which the decisions are executed or not.

## Introduction

In today's modern era of globalization, the individuals' strive and urge to shape their carrier is increasing more day by day as compared to the earlier times. Their pursuit of new and more effective governance is bringing basic variations through which people and private as well as the public organizations strain to synchronize their vast interests via the complex and interactive process of making the decisions. As the link among the public administration and citizens or common people is being rationalized and reformed in the present era globally, the perception of governance is also in the phase of reforms and restructure. The new concept of governance needs and necessitates the government and citizens to interact mutually, which will be feasible for both the governance and the citizens in order to understand each other and act accordingly.

Literature suggests that the term governance has a great diversity in meanings and usage (Kooiman and Bavinck 2005). The concept and practice of governance is not a recent one; it's known to be as old as the human civilization. Governance is the process of making the decisions as well as practice of implementing those decisions (maybe implemented or not). It is the ability of the government to form and implement rules and regulations and deliver the services irrespective of its nature whether it is democratic or some other. However, there exists a baseline precedent agreement which indicates that the governance attributes to develop its style that blurs the boundaries which create any restrictions among the private and public organizations. It's the aspect of governance to emphasis on its mechanism which don't rely on the remedy to authority and approvals of the government. The core idea of the governance refers to form a structure which isn't able to be enforced externally but that results from the interaction of the diversity of governing and having influence on each other (Kooiman and Van Vliet 1993, p. 64).

It is of interest how the governance is being used in a wide range of practitioners and academic settings to grab the shift and transformation in the thinking and working styles. In the Britain and the USA, the governance is undoubtedly in the minds of all the officials regardless of whether they are elected or unelected officials of their state. Besides, the governance also owes a resonance and significance in the debates regarding policies in other western democratic states. It has come into the policy arena of the developing countries too. At certain times, for the World Bank, the governance is condensed to the commitment of the competent, efficient and well-organized, and accountable government. In other circumstances, the governance is used to identify the dependence of the public and private as well as voluntary organizations within the developing nations.

Jessop (1995) argues that governance has a diverse, disjointed, and incoherent academic literature which is very hard to understand and synchronize. It has numerous theoretical roots which include institutional economics (IE), international relations (IR), organizational studies (OS), development studies (DS), political science (PS), public administration (PA), and the Foucauldian-inspired theorists. The precursors and antecedents of

governance will comprise of corporatism, communities related to policy, along with the wide range of economic exploration and analysis which is relevant to the advancement and evolution of the economic systems.

The concept of governance has not yet contributed in the perspective of the theories at a certain pivotal analysis level, either it proposes any new theory of the normative nature. It only provides an organizing and unifying framework which is of the utmost value. The core value of the perspective of governance lies in the capability to offer and deliver a certain effective unifying framework which is always useful to understand the fluctuating procedure of governing. It is argued by Judge et al. (1995) that such conceptual and unifying frameworks deliver a sort of language along with a frame of the references that assists to examine the reality and lead the theorists to raise the questions which might not otherwise come across or arise. And if the outcome is successful, it will give new insights which would be as useful and unique that might not be yielded by any other frameworks and perspectives. These conceptual frameworks are such effective that they can establish and form a shift in the paradigm. The importance of these frameworks can be seen in their establishment and recognition of what is considered worthy to study.

The perspective of the governance seems functional when it is helpful to pinpoint the essential questions, as well as provides a number of suitable and useful responses to those raised questions. Besides, it also offers point of reference that becomes a challenge for a number of assumptions and conventions of the traditional and outdated public administration. The traditional style of public administration is very old as indicated by its name and is not likely to be in practice in this modern era of globalization.

In the preliminary conceptualization, the eminence and excellence of the governance differ from the end where it is intended to justify and accomplish. Precisely, governance is all about the agents' performance in executing the wishes and aspirations of the principals, rather than the goals set by the principals. The government is the organization that may perform its roles better or worse, while governance is only concerned with the execution and also deals with the matters traditionally falling under the jurisdiction of the public administration opposed and conflicting by politics.

Governance signifies a shift from the form of relationship wherein the one side is governed by the other side to a certain unified set of relationships in which both the sides interact mutually so as to make the necessary and favorable choices for people. Hence, the governance shapes political and economic as well as the administrative authority and power which is later used by the societies to administer and oversee their activities. Governance comprises of the mechanism, tools, processes, and the institutions which are utilized by the citizens, individually or in groups, and the societies to make decisions and implement them, express their interest and fulfill their responsibilities and commitments, and solve conflicts and clashes. Relatively, the governance idealizes and specifies the nature of reciprocal interaction among the social actors and the interaction of social actors with public administration which lead to form the concept of joint government.

In most of the countries, all of the actors excluding government and military collectively form the civil society. Additionally, some of the states are found to have "structured crime syndicates" which also have influence on the decision-making, especially found country-wide in urban areas. In the same way, formal government structure is one of the means through which the decisions are also made and implemented, whereas the informal decision-making bodies may exist across the country which include kitchen cabinets (also known as the informal advisors). The organized crime groups known as the "Land Mafia" are found in some urban areas which also have some impact on the decision-making, while in some rural areas, the local powerful families and groups are also found to have certain impact on the decision-making process. These sort of informal decision-making syndicates and groups are usually the result of corrupt and unfair practices or may result in the same. These practices are found in most of the under-developed and developing countries and sometimes in the developed economies as well, which ruin the system of their

surrounding communities and the state as a whole, leading to poor governance.

## Output Measures of Governance

Good and virtuous processes along with the strong durable capacity are never the ends in themselves. People mostly demand their government to perform and deliver schooling system, improve education, and provide basic health, security, and defense at the national level. This recommends an alternate measure of the quality of measure which is considered as the final output. The performance of the government can be easily assessed by looking at the literacy rate; the education system at primary, secondary, and college or university levels; health; and security systems. All these factors give a clear idea of how is the government and its performance for the betterment of the state. These factors, being the attractive ones to have an idea about the government and the governance, are not always enough as the output measures of the governance. There are numerous drawbacks in the use of these factors. The very first and fundamental outputs such as the education and health are not usually the outcome of the poor governance, rather these get worse as a result of the actions of the public, as the public sectors interact with its surrounding environment which includes the people and society with whom it deals to yield the outcomes. For instance, in the 1960s the Coleman Report on the education system of the USA indicated that the outcomes related to the education depended more on the family and friends surrounding it in the society rather than the inputs of the public sectors and governance.

The second issue regarding the measurement of the output seems to be problematic itself in the perspective of methodology. The public sectors usually offer services which might be extremely difficult to measure accurately. Say, for example, the test scores have been a very common method to evaluate and assess the outcomes of educational system which have been under severe criticism and considered as the output measures of the education system. The measures of the rule of law, similar to trial time, frequency of the clearance of the cases, etc. clarify and say nothing much concerning the justice and its quality being offered by the legal system of the state.

Lastly, it's not possible to separate the measures of outcome from the procedural as well as the normative measures. The police-owned countries may be successful in controlling and minimizing the street crimes if they take immediate, unbiased actions and arrest the criminals as well as torture the suspects massively, while the liberal democracy accepts the crimes at the higher level in return of the procedural defense of the rights at individual level. Though, someone who is neutral about whether the torture is also justified as a procedure of the police, it would be interesting to know if that is employed regularly in assessing the government.

## Good Governance and Its Characteristic: Do They Really Matter?

There are eight main characteristics which collectively define the concept of good governance. It assures the minimization of corruption, considers the views of every citizen including the minorities, takes into account the voice of the helpless citizens of the society, and reflects them in the decision-making. In addition, it shows responsiveness and is approachable to the current and future desires and needs of the society in particular and state as whole. Each of the eight characteristics is defined briefly as follows.

### Participation

Participation of both the male and female is equally important and acts as a basic component of the good governance. It forms the foundation of the good governance. It may be directly or via the accredited intermediate institutes, associations, and representatives. It is necessary to mention that the democratic representatives don't usually mean to consider the concerns and issues of the most vulnerable citizens of the society in making the decisions. Rather they give equal consideration to every citizen of the society. The participation which is informed and well-organized

proves to be the effective characteristic of the good governance. This means and gives the concept of two different sides. On one side it shows the freedom to join and associate, and on the other side it refers to the well-organized and structured civil society.

### Rule of Law

A fair legal system which may be enforced impartially in the society regardless of any external influence and unfair means is the perquisite for good governance. This is also important to protect the human rights within the society, especially the citizens of the minorities so as to keep the society happy and having the sense of equality, security, and justice. To do so, an independent judicial system and incorrupt police are required which enforce the laws impartially. Both these law-enforcing bodies play an important role in making the society crime-free and unbiased, leading to promoting the good governance.

### Transparency

Transparency is defined as the decision-making which follows the proper rules and regulations in fair and unbiased manner. It ensures the free and direct availability of the information to the people or citizens who are related to or have effect from this decision and enforcement of the law. In addition, it also ensures that enough information regarding the law enforcement and decisions is delivered and that it is easy to understand.

### Responsiveness

Responsiveness is one of the characteristics of good governance which requires the service and response of all the institutions and procedures within a time span which is rational and reasonable. Timely and proper response is very important in making the governance good as it shows a sense of responsibility.

### Consensus-Oriented

A society has numerous actors and multiple viewpoints. Mediation of diverse interests within the society is required for good governance which leads to a wide consensus and helps to determine the best and common interest of the society as well as identifies the way to achieve that. Additionally, it entails a general and long-lasting perspective on the prerequisite to make a sustainable development of the human and also suggests the methods to accomplish such developments within the society. All this is possible only if the society is studied in perspective of its history, culture, and social life; this will be useful to identify the society in a proper manner.

### Equity and Inclusiveness

The well-being and happiness of any society rests on the feeling that every citizen of the society owes a stake and is not excluded from the society's mainstream. This needs every citizen in general and the neglected groups in particular to avail the chances of improving and maintaining their living, happiness, and well-being so as to stand with the society or community in the same line. This increases the outlook of the society which in turn represents the sign of good governance over there.

### Effectiveness and Efficiency

Good governance is meant as the procedures and institutes that yield outcomes which cope with the desires and needs of the society and utilize the resources at their best in the interests of the society. The paradigm of efficiency in the perspective of good governance refers to sustainable utilization of the natural resources as well as protection and fortification of the environment to keep the citizens and society safe and healthy.

### Accountability

Accountability has been a basic constraint of good governance. It is compulsory for both the government and private organizations equally to be accountable to their respective institutions or stakeholders. The accounting body differs from organization to organization and also depends on the scenario whether the decisions and actions which have been taken are internal or external. Generally, the institutions are accountable to those who have been affected by their decisions and actions. It's almost impossible to enforce the

**Governance, Fig. 1** Characteristics of good governance

accountability if the transparency and law are not there in the society or community.

By discussing all the eight characteristics (refer to Fig. 1) which join to form good governance, it will not be wrong to call good governance as an ideal that is pretty hard and challenging to achieve as a whole in the society. A very few societies and states have stepped close to attaining good governance completely as a whole. Yet, there is a great need to take initiatives and serious actions in order to ensure the sustainable development of the human to let this ideal become reality.

## Global Context of Good Governance

Based on the facts and figures which have been released by the World Development Report in 2017, the number of citizens across the globe living in democratic states touched to its peak points in 2015. This report also shows some data and clues which confirm the spreading of the electoral democracies across the globe. However, several adverse tendencies and challenges are influencing those positive trends globally. The democracy index of 2015 has shown the low frequencies of the political participation and weak position of the democratic cultures. The watch report of the civil society further illustrates that more states are being unsuccessful to fulfill their commitments of defending and enabling the civil society to form in real. The space of the civil society is getting shrink because of the uncertain peace situations and prolonged conflicts, the growth of population, and limitations against the engagement of the community in the affairs of the public.

In several developing economies, malpractice of law and order situation affects the local government and its transparency in decision-making, which is usually associated with the abuse and misuse of power and corruption. Insecurity of the tenure and grabbing of land are one of the key issues which have adverse impact on the sustainable growth and development of rural as well as urban areas in general and poor communities in particular. Estimation by the World Bank declares that only 30% of the land rights are on record across the world which is a very low ratio worldwide. That means the remaining other 70% of the people around the world are deprived of their housing and rights of land ownership documentation which make them liable to the issues of land grabbing. This also makes it easy for the land grabbers as the people owning it don't have the rights in documentation; besides, the rule of law is not that much effective and implemented there which may stop the grabbers from doing so. Therefore it becomes a free zone for them to do on their will and affect the citizens specially the poor ones. Recently, a report on the Association Agreements of the EU and DCFTA (Deep and Comprehensive Free Trade Agreement) with some countries including Ukraine, Moldova, and Georgia delineated the challenges and issues in implementation of political reforms in the Eastern partnerships wherein the PIN (people in need) utilizes the experience of transition. All these challenges are deprived of the political

**Governance, Fig. 2** Main challenges of governance

willingness to take active part and be transparent enough, inadequate capacities and aptitudes of the local government along with CSO to be capable of delivering quality evaluation of the fundamental policies. Regardless of the challenges, the released report confirms the crucial role and participation of local civil society in bringing the reforms. The civil society organizations (CSOs) strive to match and counter the needs and desires of the local citizens with the peripheral requirements of the European Union (UN); besides, the CSOs illuminate the reforms along with its paybacks to the state's population and offer them the required expertise.

Within the contemporary global context of good governance, the sustainable growth and development has also been challenged by fierceness and inter-state as well as intra-state conflicts which greatly affect the poverty levels and migration ratio. The countries implying PIN in the good governance are included as a part of index of fragility. In the fragile economies, the governments become usually unsuccessful in providing access to fundamental services along with the protection and security of the citizens. In the meanwhile, the tendency of the communities towards the principles of good governance leads them to attain sustainable growth and development of their states.

## Main Challenges of Governance

The main challenges which are discussed below are being faced by both the transition economies and the fragile states. These challenges occur in the context of governance, endeavoring to democracy along with resolution of conflicts. All the challenges are delineated in Fig. 2 for better understanding.

### Lack of Participation and Engagement

Local authorities (abbreviated as LA) usually flop in implementing the reforms associated to political transition and resolution of conflicts which have low capacity and provision. Deficiency of willingness and knowledge of the paybacks of being cooperative restricts the active engagement and participation of the surrounding communities in the decision-making process. This together with the deficit of effective planning based on evidences leads to outcomes wherein the local authorities, being the duty deliverers, make decisions that often don't reflect the community's interests and the desires and needs of the most vulnerable groups in the communities.

### Lack of Accountability

Accountability has been considered as the key factor to attain good governance. Shortcomings

in the accountability give rise to a gap among the community and decision-makers and become responsible for the delivery of services. This has great impact on the trust of communities in their local and national governments.

### Low Transparency

Rules and regulations are not usually followed in making decisions and later in implementing the same. Simultaneously, the provided information is not sufficient and also not in a form that is easy to understand. Therefore, deficit of mechanism which ensures such a process of decision-making that is transparent and followed by rules and regulations may result in increase of the corruption as well as limit the access to fair and justice in the society.

### Lack of Awareness of Active Citizenship

Communities experiencing conflict and the establishments that are non-democratic are usually deprived of trust in the abilities of their own to have influence on the affairs of public which describe the circumstances of their life. Additionally, they don't have much understanding of the civil society as well as the paybacks arising from the active engagement that leads them to take part in the process of decision-making.

### Weak Role of Civil Society

Inadequate performance of the civil society organizations results by the limitations of law, deficit of capacity and funding in several countries give rise to limited representation of the communities plus their needs in the process of decision-making. Pathetic roles in combination with low potential of the CSOs leave adverse impact on their accountability in the perspective of their beneficiaries. This generally results in dearth of trust in CSOs' communities.

### Gender Inequality

Low participation of women in politics leads to the rise in gender inequalities and creates space for biased rules and laws which affect wages, practices of the customary (including the rights of property and marriage), systems of social welfare, and others which are necessary for both men and women. To bring change, women should be supported on individual basis as well as on community and national levels. This will be an effective initiative towards making the environment favorable for the participation of women in leadership.

## Global Governance and Global Rules: Why Do They Need Reform?

The term governance has long been used to represent nurturing the relations which are dependent on each other in the deficiency of predominant political authorities as seen in global systems. It also incorporates institutes, policies, customs, processes, and initiatives by which the citizens and countries strive to get more predictability, steadiness, and direction of their reactions against the global challenges. It's nearly impossible to attain effective and efficient global governance without having effective global cooperation. In addition to being an indicator of transnational solidarity, global cooperation is a source of promoting mutual interests and common values and minimizing vulnerabilities created by the amplified interdependence, which is also one of the obligations of the legal system.

The centrality of the transnational cooperation has already been recognized by the member countries of the UN in 1945, so as to solve the issues related to economic, social, culture, or the humanitarian basis; besides, it also endorses as well as encourages the respect for rights of human and basic sovereignty for everyone irrespective of race, sex, language they speak, and religious beliefs. After adopting the Universal declaration regarding the human rights in 1948, and following the transnational treatises which let the declaration come into practice, it becomes a legal requirement for countries to ease the awareness of human rights by all via transnational cooperation. However, the main concern of the country is to accomplish the human rights, and there exists a transnational obligation for countries to eradicate the hindrances which are afar from the range of the individual nations and that hinder the occurring of situations as well as social provisions essential for the accomplishment of the human

rights (Fukuda-Parr 2006). In the meantime, the declaration regarding the right to develop (United Nations, General Assembly 1986) clearly calls on countries to perform jointly and individually to form an empowering atmosphere for growth and development, predominantly by eradicating obstacles and generating opportunities and prospects (Ibid., Preamble, articles 1, 2, 4, and 7).

## Conclusion

Governance is a perspective which offers a structured framework or map and guide to the moving world of the governments globally. Besides, it also pinpoints the trends as well as developments in this modern era. Governance promotes the development of human via prominent participation along with the equalities in social and economic perspective. Its main objective is to create a society with proper rules and regulations, equality, participation, accountability, and transparency. Governance is the fundamental factor which builds the nation.

## Synonyms

Foreign aid and governance; International assistance and public administration

## Definition

Governance is broadly defined as the government's ability to make and enforce rules and to deliver services, regardless of whether that government is democratic or not. Being multi-faceted, governance encompasses all aspects of the exercise of authority through formal and informal institutions in the management of the resource endowment of a state.

Foreign aid consists of the financial and other resources voluntarily transferred by a donor country/organization to a recipient country/organization.

## Introduction

The effects of official development assistance (ODA), and foreign aid in general, and its impact

on the quality of governance in the recipient countries are a matter of both scientific and political debate. It has attracted considerable attention of academics, development policymakers, donors, and other stakeholders. "Good governance" is required by international institutions as a condition for international assistance to developing countries, but it has been argued that the ODA conditions of globalization and privatization as a part of structural adjustment programs have increased, rather than reduced, corruption in less-developed countries.

Although foreign aid is aiming to combat poverty and to promote economic, social, and human development in the recipient county, some studies indicate that it is ineffective in promoting economic activities and growth, that it failed to improve the institutions and the governance in these countries, and that it promotes opportunist behavior and rent-seeking. In contrast to these criticisms, a large body of empirical studies exists that gives evidence of the important role of foreign aid in enhancing economic growth, reducing poverty, and in improving institutions and governance. Moreover, it has also been shown that the contradictory statistical evidence on the effectiveness of foreign aid has suffered from measurement problems, as well as from methodological flaws.

## Foreign Aid and Governance: The Optimist and Pessimist Views

Theoretically, foreign aid supplements government tax revenues in the aid-receiving countries, thus lessening binding financial constraints. Although not leading directly to improved governance, it might do so indirectly, since it will allow the recipient governments to focus attention more on improving governance, which includes rule of law, law enforcement, maintenance of social order and security, the fight against corruption, improvements of public service delivery, etc. Some forms of foreign aid, such as aid-for-trade, are providing technical assistance to the recipients, thereby contributing more directly to the improvement of the quality of their institutions, governance, and accountability.

The arguments in favor of the mentioned indirect relationship include (e.g., Bräutigam and Knack 2004):

1. More ODA makes more funds available for the recipient countries' development agendas for improving public services, for enhancing effective policy formulation and implementation, and for establishing strong and effective institutions.
2. Foreign aid can be utilized for enhancing state capacity through training and technical assistance to the public development administration in the recipient countries, possibly leading to the enhancement of the quality of public administration and the use of public resources and thus to greater effectiveness of governance and better institutions.
3. Foreign aid can be used to strengthen procedures and institutions for state-society linkages, including support for judicial reforms and the rule of law, as well as the fight against corruption.
4. Some foreign aid is directly made to empower non-governmental organizations and civil society organizations with genuine development agendas in their missions, allowing these organizations to engage more productively with their host governments for the benefit of the general public and possibly for the interest of the aid-giving countries.

In contrast, the pessimist views on foreign aid suggest that foreign aid may result in the deterioration of governance quality in the receiving countries in several ways (Knack 2001; Bräutigam and Knack 2004):

1. Aid-funded projects siphon off talented but low-paid employees of the public sector, encouraging them to have multiple jobs, thus distracting their attention and reducing their commitment in their government workplace.
2. Foreign aid may undermine existing institutions, encourage rent-seeking behavior, foment conflicts over the control of aid funds and/or aid-funded projects, and alleviate pressure to make necessary reforms of the existing inefficient political institutions and policies.

3. Dependence on foreign aid may create moral hazard by aid-receiving governments who believe that they may be bailed out by the donor community when facing fiscal constraints.

Recently, Addison et al. (2017) have taken stock of the large empirical literature on the aid effects and the effectiveness of foreign aid since the establishment of the foreign aid programs in the late 1940s. The results of these empirical studies were mixed (especially those related to macroeconomic aid-growth effects of aid) and inconclusive, but more recent findings are more converging, and the pessimist views that aid is ineffective and harmful receive much less empirical support in the existing literature. Also, in an in-depth review of the existing aid-growth literature, Arndt et al. (2015) take note of the positive role that aid has played in promoting economic growth for the aid recipients over the longer time horizons.

## Empirical Studies

The empirical literature on the effects of foreign aid on governance is relatively scarce. Often an econometric specification is used with the quality of aspects of governance explained by foreign aid, controlling for other variables that are influencing governance quality, such as per capita income, openness of international trade, foreign direct investment, and the quality of democracy, sometimes supplemented with a binary indicator of "British legal system origin" in the aid-recipient countries.

Governance indicators used in the empirical literature are mostly government effectiveness (GE), measuring the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies; regulatory quality (RQ), capturing perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development; rule of law (RL), capturing perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence; and control of corruption (CC), measuring perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests.

Using data from 32 African countries over 1982–1997, Bräutigam and Knack (2004) found that aid deteriorated governance and that the negative relationship between high aid levels and the worsening governance is statistically significant and robust. Their findings also suggested that higher aid levels resulted in a lower tax share of GDP, which is confirmed by a number of studies. Similarly, Busse and Gröning (2009) examined the aid-governance nexus based on a sample of 106 aid-receiving countries over the period 1984–2004, using the generalized method of moments (GMM) estimation strategy. Their estimation results suggested that aid negatively affected governance in these countries. Their findings are robust to different specifications.

Using cross-sectional data from 80 recipient countries, Knack (2001) found that aid dependence hurts the quality of institutions and governance (proxied by rule of law, bureaucratic quality, and control of corruption in the government). Asongu and Nwachukwu (2016) investigated whether foreign aid has had any impact on governance in Africa. With the governance data from the World Bank's Worldwide Governance Indicators covering 52 African countries, they found that ODA undermined these countries' quality of governance, measured by indexes of government effectiveness, regulatory quality, control of corruption, and rule of law. Other aspects of governance, such as voice and accountability and political stability, did not seem to be negatively affected by aid.

Following Knack (2001), with different data sources and somewhat improved estimation methods, Ear (2007a) tried to replicate Knack's results, using indexes of the World Bank's

concept of governance which is disaggregated into six dimensions, namely, control of corruption, government effectiveness, rule of law, regulatory quality, political stability, and voice and accountability. Using data from more than 200 countries and territories, Ear's estimation results suggest that only the rule of law is found to be negatively related to aid, but its statistical evidence is rather weak. The findings are not robust and largely sensitive to the model specification. Another paper by Ear (2007b) used Cambodia as a case study to look into the relationship between aid and governance. Based on a survey of just 43 respondents who, as indicated by Ear, were "development experts" working for donor agencies, international NGOs, local NGOs, and the Royal Government of Cambodia, he concluded that aid did not have a positive impact on governance in Cambodia and may even have contributed to its further deterioration (Ear 2007b). However, these results may suffer from methodological flaws, and the interpretations of the results, therefore, have to be made with great caution, due largely to the very small sample size of a survey of only 43 informants that, in any case, cannot represent the population of Cambodia.

In contrast, Jones and Tarp (2016) found that foreign aid exerted a positive net effect on political institutions, which was largely generated by the conditionality that aid was allocated for the enhancement of the quality of the recipients' governance. Their finding is in line with that of other researchers of the long-run aid effect on democracy. Dutta et al. (2013), who examined the nexus of aid and political institutions, concluded that aid contributed to making already democratic countries more democratic, but also that aid can be used to strengthen democracy in countries where democracy is weakly practiced. In turn, investigation of the effects of multilateral aid on corruption showed that higher aid levels were correlated with lower corruption but found no effects of bilateral aid.

Many previous studies investigating the links between foreign aid and the quality of governance or determinants of governance have used cross-sectional data, i.e., a dataset that contains information on the sample of individual countries taken at a given point in time only. However, it has been recently argued that the use of cross-sectional data analysis leads to biased results due to unobserved individual country-specific heterogeneity.

Studies that use a set of country data over time (panel data) have to deal with the so-called endogeneity problem, i.e., aid having impact on governance, but donors also rewarding good governance performance with more aid. Some recent studies of panel data sets report mixed results. Okada and Samreth (2012) investigated the impact of foreign aid on corruption in 120 developing countries for the 1995–2009 period, applying the quantile regression methodology, and found evidence that foreign aid generally reduces the levels of corruption. Soeng et al. (2018) applied Hausman-Taylor methodology to estimate the impact of foreign aid on governance in a panel data set from ASEAN member countries over 1996–2015 and found a significant positive impact on control of corruption. However, Mohamed and Azman-Saini (2015) analyzed a panel data set of 52 African countries over 1996–2010 by means of both the two-stage least squares instrumental variable estimation technique and the system generalized method of moments and reported that foreign aid tends to have a statistically significant negative impact on control of corruption but also reduces the corruption perception.

## Conclusion

In sum, more recently, the previously dominant pessimist views that aid is ineffective and harmful have received much less empirical support. Many empirical studies on the impact of foreign aid on governance found evidence of a negative impact. However, most were based on cross-sectional data analysis and therefore have biased results. Recent panel data research reports a positive impact. It can be concluded that foreign aid appears to be important for the developing world as it tends to help address the development bottlenecks of the countries. Despite different results were reported in the literature, the positive effects of aid on aid-

receiving countries, in particular those that had suffered from civil war, internal conflicts, and enduring upheavals and are in dire need of capital for their reconstruction and development, should not be overlooked. This merits the question: What would have happened to these countries' governance in the absence of assistance from richer countries?

# Governance and Buddhism

Aka Firowz Ahmad
Department of Public Administration, University of Dhaka, Dhaka, Bangladesh

## Synonyms

Buddhist governance; Buddhist perspective of governance; Governance in Buddhism

## Definition

Based on the spirit of ***Sobbe satta shuketa vabantu*** meaning all entities be happy, Buddhist governance offers a total system perspective of governance to steer human action, both individual and collective, including everything within its functional purview.

With ***Nirvana*** (ultimate freedom) as the overall goal, Buddhist governance includes four noble truth, eightfold path, three shelters (Trissarana), Patimokkha (accountability), and Barshabsa (moral and intellectual development process) from systems perspective.

**Buddhist governance** refers to the vision of wholeness as well as the interrelationship and functional connectivity among all entities, living and nonliving. Basing on *sila,samadhi* and *prajñā* it integrates everything from complicated individual human mind to all inanimate bodies and forces into a system to attain the of *Nirvana*. It refers to the final goal of Buddhism where there is no desire, suffering or sense of self and the soul is released from the cycle of karma, death and rebirth.

## Introduction

Governance as a system of steering human actions ranging from decision making to decision implementation through the use of power/authority involving different institutions, mechanism, process, and traditions within the environmental

supra-system is always present in all human activities both at individual and collective levels. It is as old as human being and human society. But the nature of governance has been remarkably changed in the different stages of social evolution from the primitive communism to modern capitalist society characterized by globalization and open market economy, and it becomes very complicated. Consequently governance failure followed by the urge for good governance has become a universal phenomenon throughout the world. In the case of developing countries, major donors and international financial institutions are increasingly basing their aid and loans on the condition that reforms ensuring good governance are undertaken. The World Bank views good governance and anti-corruption as central to its mission. It is also remarkably represented in the academic and intellectual discourses as well as different prescriptions, and reform moves have been also made in different countries. But the situation related to good governance did not improve in most of the countries. Moreover, corruption is found to increase and assume an endemic form. The governance system fails to maintain dynamic equilibrium and attain the desired goals, faces disorder, and eventually turns into bad governance. The prescriptions so far made emphasizing only on the structural, procedural, and the legal issues of the organization with a view to combating corruption and increasing efficiency neither consider governance from holistic perspective nor focus on the value issues emanating from the internal weaknesses of capitalism and incongruence of the strong capitalistic values with the surrounding realities.

Within capitalistic framework, consumerism driven by market forces has appeared as a new world religion. But the crisis of consumerism is infecting every culture and governance system of the world and invalidates its two basic assumptions, i.e., "(i) growth and enhanced world trade will benefit everyone, and (ii) growth will not be constrained by the inherent limits of a finite planet" that uphold urgent need for constructing alternative perspective of development and governance considering the multifarious realities of the society concerned. Since Buddhism had a glorious heritage in human and social development in Asia and still, despite of all religious differences, it has enormous normative influence on social values and culture, this paper makes an attempt to analyze Buddhist system of governance with a view to developing an alternative perspective of good governance based on Buddhism. With the Nirvana (ultimate freedom) as the overall goal, the theoretical framework has been constructed from systems perspective including the four noble truth, eightfold path, three shelters (Trissarana), Patimokkha (accountability), Barshabsa (moral and intellectual development process), and so on. Buddhist governance refers to the vision of wholeness and the interrelationship and functional connectivity among all entities, living and nonliving as well as material and nonmaterial. It integrates everything from complicated individual human mind to all inanimate bodies and forces into a system. *Nirvana* refers to the final goal of Buddhism where there is no desire, suffering, or sense of self and the soul is released from the cycle of karma, death, and rebirth (Buddharakkhita 1985). ***Sobbe satta shuketa vabantu*** meaning all entities be happy offers a total system perspective of governance to steer human action, both individual and collective, including everything within its functional purview. Blended by the principles of decentralization, participation, and accountability, the Buddhist perspective, contrary to consumerism, strives toward a sacrifice-oriented integrated development through a corresponding system of governance for ensuring holistic peace and progress in the society.

Gautama Buddha, once the crown prince Siddhartha of Shakya Kingdom of Northern India and afterward, Buddha who from the peak of the state governance and from the palace came down to the bottom of the society and to the common people, introduced a new system of governance. Buddha organized people under the *Sangha*-centered governance system which paved a way for masses historically exploited under rigid caste and class system for salvation and thereby significantly changed the stratified social system. This social governance system had been in practice in Indian society including

Bangladesh for centuries together, and its approach still can contribute in constructing social governance in modern time.

## Background of Buddhist Governance

Gautama Buddha, the crown prince of Shakya Kingdom in the Northern India, introduced his religion as a revolt against the governance system prevailing in a strongly stratified feudal society characterized by the dominance rigid class and caste system (Asvaghosha 1883). Centralization of authority based on tradition and coercive power, dependency, discrimination in the distribution of resources, and status and dignity sustaining exploitation in institutionalized forms legitimized by strong religious belief system were the basic features of that governance system. This system was generating sufferings of millions of downtrodden people termed as *Sudras or Dassha*. Gautama realized the sufferings of these people along with the common suffering of all human beings during their impermanent life time. One day Gautama Buddha would become the number one man in that system assuming supreme power to steer the kingdom, he would become the head of that governance system based on the prevalent Vedic values and norms, but it was quite clear to him that it was not possible to ensure the salvation of the oppressed human being materially and mentally within the existing system of governance and/or by using the prevalent power structure.

The power he inherited was externally exposed and exercised, bestowed on him due to his position in the social structure where individual self was uncounted and ignored. Buddha moved on to a different way, he took individual as basic point of reference and basic source of power, and lastly he explored a new way of life and new type of power with a corresponding system of governance. His contemplative intellectual ability with higher-level mental makeup helped him clearly understand the evils of the state governance that left the crown, palace, and his family in search of alternative system for the salvation of all entities including human being. He took a declassed form, and after being enlightened through a hazardous process, he revealed a new lifestyle within new system of governance.

Buddha introduced this revolutionary governance system during his lifetime without encountering any opposition from the vested interest group. Because of universal and massive conversion of common people into his system, Buddha did not encounter any resistance to introduce the system. Later on during the period of *Ashoka*, Indian society in general predominantly became under the social governance system of Buddhism (Chimoa and Chattopadhyaya 1980). Historical record shows that in the third century four fifth of the total population of India Buddhist who would lead *Sangha*-centered life. Due to a theoretical weakness emanating from the principles of prohibiting killing of any living being and winning enemies through friendship, Buddhist governance could not develop any mechanism to protect and sustain itself in the birth place of Buddha. But in Bangladesh, it survived unto mid twelfth century, and the period from 750 to 1150 during Pala kingdom may be termed as the most glorious period of Buddhist governance throughout the history all over the world.

The regime started with Gopal who was elected by the community or community leaders. The rulers adopted the title *pala*, the word derived from Bengali word *palon* meaning nursing and rearing with attention and devotion. The title of the kings in fact upholds their objectives in regard to their role as the head of the kingdom. Buddhism, contrary to the Arian hierarchical and centralized authority both in social and state formations, presented a decentralized society-based governance structure within the framework of *Sangha* which assumed the role of social governance and eventually took the responsibility of the kings at the social levels. The *Sangha* does not only provide the social foundation of Buddhism but also provide an institutional framework of social governance which is responsible for maintaining social peace and harmony involving the members of the society. The role of the king within the scaffold of *palon* was to facilitate this governance. This period experienced community-based development cloth and other industries and

institutionalized growth of Viharas as seats of higher education equivalent to modern university that attracted foreign Buddhist personalities like Fa hien, Hu en shang to visit Bangladesh to be enshrined with Buddhist wisdom. World famous scholar Atisha Diponkar is the product of the foundation of the sociocultural values of Bangladesh society that was led by this social governance during this period. It faced the same fate of extinction as happened in India in the sixth century built in weaknesses and seizure of state power by the Vedic *Sen* Dynasty. The social governance as well as Buddhist people could not stand before Sen's aggression. A bulk of the population was killed, some fled way from the main land and migrated to non-Vedic society in Java, Sumatra, and other places, and the rest was coercively converted into *Sudras*, the neglected caste in Hinduism.

## Framework of Buddhist Governance

Buddhism which is termed as Dhamma Vinaya by Buddha himself provided a comprehensive alternative system of governance with normative and institutional framework which is directed to ensuring the human equality, freedom, and salvation from holistic perspective (Buddhist Monsatic Code 1993). *Dhamma Vinaya* is the foundation of Buddhist governance where Dhamma means truth and Vinaya means discipline. These two need to work together as guiding principles to achieve the goal of governance. Buddhist governance is characteristically a system of social governance which is exercised socially by Sangha within the framework of the four noble truth, trisharana, silla, samadhi, and prajna. Buddha's objective was not to provide a new governance system but to uphold happiness for all entities phrasing within "*sobbe satta shuketa vabantu*" meaning all entities be happy. It offers a total system perspective of governance to steer human action, both individual and collective, including everything within its functional purview. It upholds the vision of wholeness and the interrelationship and functional connectivity among all entities, living and nonliving as well as material and nonmaterial. It integrates everything from complicated individual human mind to all inanimate bodies and forces into a system. It does not only emphasize for the happiness of human being or all animal or living being rather strives for the happiness of all entities which functionally refers to provision of scope to the entities to properly play their role without disturbing dynamic equilibrium in the system.

### *Arjjasatta*, the Philosophy of Policy Formulation

Buddhist system of governance is primarily founded on *Arjjasatta*, the four noble truths comprising *(i) suffering exists*, (ii) *there is a cause for suffering*, (iii) *there is an end to suffering*, *and (iv) there are ways to end suffering* that provides a framework to analyze the dynamics of changing individual and social life. The first two truths explore two universal realities existing in individual human being and in human society, while the last two noble truths assure that the sufferings are not unsurpassable and confirm that there are ways to overcome the sufferings and act as the basis of all efforts as way forward. Arjjasatta is a rational, realistic, positive, and forward-looking approach to solving human problems at all levels and making human being dynamic and peaceful. It recognizes continuous changes in all beings following the law of *Anicca* for which there always arises problems in individual human being and in human society resulting in sufferings. The transitory nature of the system inherently accompanies problems and sufferings with it. There is no scope to think that any state, position, or any role is constant. If anyone thinks himself as constant within his role and position and starts acting accordingly, that essentially causes suffering for himself and others as well. This happens only for mental and intellectual incapability of persons or entities concerned. The second truth refers to the causal relationship of suffering and exploring the causes. Sufferings are the product of the causes and none of the suffering is out of nothing. The third truth creates hope and drives toward efforts for salvation by directing that there is an end of sufferings. Sufferings, according to Buddhism, decreases with the increase of freedom in respect of mind, intellect, and resources. The fourth truth

holds that there are ways to get rid of sufferings, and it necessarily refers to a system of governance that provides individual and society the capacity to control individual and social self and to uphold mental, intellectual, and financial freedom by using different institutions, norms and values, principles, and mechanism.

The main focus of governance is decision making and implementation through the interaction of different forces. Arjjasatta is a pragmatic model decision making from holistic perspective. Available models of decision making strive normally for reaching solution whereas arjjasatta explores the philosophical roots of problem along with environmental dynamism.

### *Kamma*, the Focus of Governance

Work occupies central position in all types of governance, and perception of work eventually molds nature of governance system functioning at any level. Based on the differences in the perception governance also varies resulting in different output and impact. This issue could not receive due or comprehensive attention in the present governance thinking. Buddhism defines work as karma and emphasizes on it with the assumption that human being is capable of changing his/her status by dint of work and individual should be measured based on work not on birth or caste or class belongingness. Unlike conventional definition/interpretation of work only from physical point of view, Buddhism gives a holistic perspective of kamma or work by the concept ***kayamonobakkya*** which is the combination of *kaya (body)*, *mono (mind)*, and *bakkya*, and correspondingly there are three types of work such as *(i) kayek (physical)*, *(ii) manashik (mental)*, and *(iii) bachanik (oral)*.

Mental work shapes individuals thought pattern, mental framework, personality makeup, and intention. Oral works are related to speech and interpersonal communication that affect interpersonal relationship and concerted efforts. Behavior of any individual is primarily manifested by his/her oral and physical works which is always guided by mental work. In Buddhism since mind is considered as the chief and forerunner of all conditions, mental work holds the central position in the work system. "If, with an impure mind, one speaks or acts, then pain follows one, even as the wheel follows the hoof of the ox" (Barua 2004). In the present framework of governance, only physical work is considered; the other two sectors of work, mental, and oral are equally ignored and all the measures, guidelines, rules of business, evaluations, and trainings for the betterment of governance center round this work.

### *Trissarana*, the Structure of Governance

*Trissarana*, also called Triratna or three jewels, consisting of *Buddha*, *Dhamma*, and *Sangha* corresponding to enlightenment, discipline, or code of behavior and community organization, respectively, constitute the broader structure of governance giving it an institutionalized form with the capability to solve continuously emerging problems and sufferings in individual and social life. *Sarana* means shelter and *Trissarana* refers to three types of shelter related to mind, behavioral code, and organization. All these three shelters form a system as a unitary whole and work inseparably to achieve the ultimate goal of solving problems and removing suffering. The trisharna-like oath is always recited or kept in mind as (i) *Buddhaṃ saraṇam gacchāmi*, (I take refuge in the Buddha) (ii) *Dhammaṃ saraṇam gacchāmi* (I take refuge in the Dharma), and (iii) *Saṃghaṃ saraṇam gacchāmi* (I take refuge in the Sangha) by the followers.

The term *Buddha* has its origin on word "budh" which means realization with understanding and feelings. In Buddhism, *Buddha*, the first shelter as the first jewel/ratna, refers to enlightenment based on supreme form of knowledge and morality to encompass intellectual and mental capability. Intellectual capability enables to analyze the problematic situation and develop solution, while mental ability helps to decide what is right and what is wrong, i.e., the normative dimension of decision. Bad governance, resulting in inefficiency and corruption, emerges when there is any limitation in these capabilities. Mental or moral incapability of stakeholders is instrumental to any corruption in governance. For good governance all individuals or stakeholders need to be committed and directed to enlightenment and

attain a level of concomitant intellectual and moral development.

*Dharma* in its broadest sense refers to the natural order or universal law that underpins the operation of the universe in both the physical and moral spheres. In Buddhism it denotes the totality of Buddhist teachings that are thought to accurately describe and explain the underlying universal law so that individuals may live in harmony with it (Bukkyo Dendo Kyokai 1992). In *Abhidharma Pitaka* it refers to the individual elements that collectively constitute the empirical world. Some of these elements (dharmas) are external to the perceiver, and others are internal psychological processes and traits of character (Harold 2003). In its totality *Dhamma* provides a code of behavior related to physical and mental psychological interaction of individual. The most significant characteristics of this code are that it tries to make consistence and balance with the universal laws of nature and codifies the mental and psychological aspect of human behavior that are ignored in the existing codes of good governance.

*Sangha* refers to the community or organization consisting of monks, nuns, and other community people who accept the trissarana (the three jewels or ratna). In Buddhist terminology common people are *upāsaka* and *upāsikā*. Based on a monastery *(vihara)* as its center, Sangha is a social unit of religion, administration, and education. It upholds a community-based and participatory system of social governance under an intellectually and spiritually developed self-sacrificing, discipline, and committed leadership. The commitment of leadership is to enhance "*sobbe satta shuketa vabantu*," happiness for all entities. *Sangha* is the institution responsible for steering the society involving its members following the behavioral codes of *Dharma*.

*Bihara* is the secretariat of the *Sangha* headed by a monk or Vikkhu named *Sthabira*. He teaches Shila, Samadhi, and Prajna and responsible for maintaining social harmony, peace, and development. In the society, larger type of Bihara is called *Mahabihara* and the head is designated as *Mahasthabir*. There are some basic codes to run the different activities of Bihara that provides a framework of participatory and accountable system of community-based governance. The leadership of the Sangha is selected through massive consultation and consensus basis from among the Vikkhus of the Bihara who is senior and more closer to Nirvana and who has the capability to run the Sangha.

### *Nirvana* and the Codes of Governance

Founded on the philosophical premise of Nirvana Buddhist codes of governance, it encompasses all the three dimensions of karma or human behavior within the framework *Pancasila*, *Austtamagga*, *Patimukkha*, and so on. Literary meaning of Nirvana is "to blow off" (The teaching of Buddha 1992). It is the highest forms of enlightenment based on intellectual capabilities and mental capabilities. It upholds a state of freedom from all exploitative relationship and exploitation where individual is free from personal ill motives and desires that cause harm for him/her and also for others. The goal of governance in Buddhism is to lead human being individually and human society as a whole toward freedom. The pattern of behavior or kamma at the stage of nirvana is guided by four principles (Table 1) such as (i) metta (loving kindness), (ii) karuna (compassion), (iii) mudita (sympathetic joy), and (iv) upekkha (equanimity).

Nirvana makes man impersonal endowed with wisdom which is necessary to take rational and realistic decision in accomplishing kamma. It refrains the human being in committing

**Governance and Buddhism, Table 1** Main features of metta, karuna, mudita, and upekkha

| Ideals | Main features |
|---|---|
| Metta | Cultivation of loving kindness toward all, including the vanquished |
| Karuna | Compassionate thought arising on seeing the sufferings of other, helping suffering people with material and nonmaterial assistance, devoting time, thought, and energy to remove the causes of sufferings of other |
| Mudita | Detaching joy by means of which one rejoices over the prosperity of others and does not entertain any jealousy toward them |
| Upekkha | Psychological balance of an individual during the time of gain and loss |

corruption. Due to *mudita* and *karuna* it is always responsive to the problems and sufferings of other.

### Pancasila

Pancasila, the five basic principles included in the Vinaya Pitak, may be described as commandments applicable in the field of social governance. While the eightfold path emphasizes mostly on governance at individual level, *Pancasila* focuses on the basic dimensions of collective governance and constitutes the basic framework of human, economic, and environmental relationship (Bu-ston 1931). The five principles include (i) not to kill any living being, (ii) not to take what is not earned, (iii) not to commit sexual misconduct, (iv) not to make false speech, and (v) not to become intoxicated.

Buddhism, in its literary sense, prohibits killing of both human and all other living being, but practically it is not possible because every act of eating at least causes killing of herbs and plants. Killing of living being other than man may be done for protection from harm or to gain necessary subsistence for survival. But for maintaining biodiversity and ecological balance, destruction of herbs, plants, and animal is no way it can be allowed without extreme necessity. Killing of human being in most of the cases takes place out of rivalry, jealousy, and greed for power, resources, and benefits. It destroys social harmony, balance and peace. Restrictions on killing in Buddhism are directed to maintaining social and environmental balance.

Material and interpersonal relationships are two most dominant types of relationships in governance system. The second principle lays the foundation of material relationship by giving bar on taking or using unearned income in the forms of goods and service. Resources gained through stealing, robbing, hijacking, gambling, bribery, interest, cheating, corruption, and exploitation are unearned income. These types of incomes generate exploitation and injustice in the society and make it stratified. Corruption as means of unearned income has been infecting the current governance system throughout the world.

Male and female relationship constitutes the core of interpersonal relationship. If this relationship drives toward sexual misconducts, then the total interpersonal relationship becomes at a stake and brings chaos in the social governance. Sex is only allowed in Buddhism within the marital family bondage. Although in most of the Western societies following consumerist spirit encouraging free sex, allowing homosexuality and in many societies legitimacy is given to prostitutions in the name of sex work, but all these are sexual misconducts and prohibited in Buddhism by the third sila. These misconducts destroy family system, the basic unit of the society, and creates psychosocial anarchies.

The fourth sila prohibits distortion of facts through false statement. Interaction among individuals based on false statement destroys trust in the organizations. Trust is the basic capital in all organizations and in all interactions. False statement or false message throws all interactions into validity, objectivity, and reliability crisis. Corruption at any level cannot take place without distortion of fact, and when facts are distorted participation cannot play effective role, and transparency disappears in the system. Peace and discipline cannot exist amidst falsehood (Bapat 1962). Consequently bad governance engulfs everything producing unintended outputs.

The last sila directs people not to become intoxicated since it disturbs the internal discipline in the individual being. Effects of internal disorders do not remain confined within individual only, moreover affect the whole system. When person involves in substance abuse, she/he gradually loses all the capability to lead a normal life and appear as a problem in the family and society. Since in drug trade profit margin is very high, a group of powerful international traders are engaged in this business; they are so powerful that they hardly care for the global governance.

### *Austta Magga*, the Eightfold Path

Buddhism prescribes three sets of behavioral codes needed to guide the kamma or work effective through the exercise of good governance (Table 2). These are (1) wisdom (Sanskrit, *prajñā*; Pāli, *paññā*), (2) ethical conduct (Sanskrit, *śīla*; Pāli, *sīla*), and (3) concentration (Sanskrit and Pāli, *samādhi*). These three sets of behavioral

**Governance and Buddhism, Table 2** Eightfold paths under sila, samadhi, and prajna

| Division | Eightfold path | Different dimensions in the paths |
|---|---|---|
| Wisdom (Sanskrit: *prajñā*, Pāli: *paññā*) | (1) Right view | The understanding of the four noble truths about the universality of suffering (unsatisfactoriness), of its origin, its cessation, and the path leading to that cessation |
| | (2) Right intention | Thoughts free from sensuous desire, from ill-will, and cruelty |
| Ethical conduct (Sanskrit: *śīla*, Pāli: *sīla*) | (3) Right speech | Abstaining from lying, tale-bearing, harsh language, and foolish babble |
| | (4) Right action | Abstaining from killing, stealing, and unlawful sexual intercourse |
| | (5) Right livelihood | Abstaining from a livelihood that brings harm to other beings, such as trading in arms, in living beings, intoxicating drinks, poison, slaughtering, fishing, soldiering, deceit, treachery, soothsaying, trickery, usury, etc. |
| Concentration (Sanskrit and Pāli: *samādhi*) | (6) Right effort | The effort of avoiding or overcoming evil and disadvantageous things and of developing and maintaining advantageous things |
| | (7) Right mindfulness | Mindfulness and awareness in contemplating body, feelings, mind, and mind objects |
| | (8) Right concentration | Concentration of mind associated with advantageous (kusala) consciousness, which eventually may reach the absorptions |

codes include the great eightfold of paths. *Praj*na is wisdom comprising of right perspective and right commitment. *Sila* is related to a set of behavioral codes that include: right speech, right deeds, and right livelihood. *Samadhi* includes another set of behavior – right smriti (memory), right exercise, and right meditation.

For good governance a clear perspective consistent with the universal law and commitment to that perspective is required first. Prajna or wisdom ensures these basic aspects. Governance exercised in most of the cases due to the absence of perspective or perspective theoretically only without applications fails to achieve its objective and eventually appears as bad or evil governance. Sila manifests the guidelines of oral works and physical works so that these are performed righteously for earning right likelihood. This is necessary for material self-reliance of individual without depending on others and for avoiding any exploitative material relationship (Ilaiah 2010). Samadhi is related to right memory that keeps individual aware of the past and history. Smriti helps in taking proper decision based on past experience. Samadhi emphasizes on exercise for upholding dynamism and forward movement, while meditation directs the mental works and leads people to mental salvation. Prajna is wisdom, consisting of clear perspective and simultaneously commitment to the perspective.

### *Patimokkha,* the Accountability Code

In the Buddhist community-based system, the most important instrument for ensuring good governance is the exercise of Patimokkha for making an accountable society. Patimokkha is a treatise on crimes. It contains 227 rules related to crimes divided into eight sections (The Buddhist Monastic Code 1993).

1. Parajika – defeat
2. Sanghadisesa – formal meeting
3. Aniyata- undetermined
4. Nissaggiya pacittiya – forfeiture and confession
5. Pacittiya-confession
6. Patidesaniya-acknowledgement
7. Sekhiya-training
8. Adhikarana-samatha- settlement of issues

In each fortnight people of the society are to visit the Sangha. Vikkhu, the leader, reads out the Patimokkha. If anyone has committed any crimes enshrined within the 227 rules, the crime is properly analyzed and the persons concerned in this regard is corrected. This is perhaps a very

effective form of social accountability and transparency.

### Education for Governance

Education is an integral part of Buddhist governance. It is the responsibility of the Bihara to conduct education program both for the *Sramanas* and general masses. The Buddhist approach to education is also community based in nature and consists of *Guru* (teacher), deshana (teaching), and *dhan* (meditation). Guru is more than a teacher, but a model before students. In addition to the three refuges, functionally the guru is considered as an additional refuge to the formula, since access to the other three refuges is considered to be dependent upon the kindness of a teacher.

Besides teaching and learning, meditation gets highest emphasis in the system of education which is devoted to total knowledge and wisdom. For massive education and enlightenment of the sramanas and vikkhus, 3 months are reserved popularly known as *Barsh Basha* for intensive involvement in education and meditation. The larger *Biharas* are responsible for rendering higher education.

## Conclusion

Buddhist governance, centering round Sangha, is essentially social governance. Like the absence of the reference of God in the different discourses on Buddhism including nirvana, shilla, magga, and so on, there is no reference of central state governance in Buddhism. Buddha's observation on the failure and helplessness of central governance in removing sufferings of individual and collective life and its role in sustaining rigid stratified and exploitative social relationship legitimized by religion would perhaps make him disinterested to pay any attention to the state governance. In his governance man is the basic point of reference within the social system. The concept of governance lies on the assumptions that human beings are capable of changing their positions by dint of their kamma if it is performed systematically following proper codes within the framework of Sangha or society. Social governance cannot be effective in the stratified society or where inequality dominates the society. Buddha started with denying with all conceptual and functional stratification remaining in the society. This gave a solid foundation to establish a sustainable social governance system which remained effective in the different parts of India including Bangladesh and Sri Lanka for centuries together. The system was from within the society and the members of the society also owned it.

Buddhist governance holds a comprehensive perspective complying with its objective to work for the happiness of all entities, human, and other beings. This governance operated following a philosophical model of policy/decision making within the framework of arjjasatta or four noble truths. Thus governance needs here to remain always alert to encounter problem and increase tolerance level. It also helps emerge dynamic governance. Since it was based on holistic perspective, it could establish operational sense of connectivity among individuals and all other entities. Nirvana-oriented worldview turned the connectivity into strong and sensitive bondage in the society where it was in practice. One of the unique traits of this governance is loving impersonality and functioning in unbiased manner. Present governance system is based on capitalism which gets momentum through consumerism. While the crisis of consumerism is now infecting every culture and governance system of the world and invalidates its two basic assumptions, i.e., "(i) growth and enhanced world trade will benefit everyone, and (ii) growth will not be constrained by the inherent limits of a finite planet," the nirvana-directed sacrifice-oriented governance model has immense potentiality to develop alternative system of governance.

The governance addresses the structure of the society, the structure which is convenient for running sound social governance system by the principles of *Pancasila*. It draws up the boundaries of material relationship, human relationship, and environmental relationship along with consistent behavioral pattern of social governance. Any governance, state, local, or social always demands structural context of the society. Taking lesson from Buddhist social governance in the present efforts for good governance either at central

administration or at the local one, this issue should be treated with serious attention.

# Governance and Citizenship

Md Nurul Momen
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Anti-corruption; Civil society organizations; Corruption; Governance' Government

## Definition

Corruption simply refers to fraudulent practices conduct by powerful people for their private gain.

Civil society organizations (CSOs) are the nongovernmental organizations, without a significant government control and management, that exists in many different forms, some informal and some as formal organizations such as nongovernmental organizations (NGOs), professional association, community-based organizations (CBOs), trade unions, and faith-based organizations (FBOs) come together to pursue for a shared interest and collective action.

## Introduction

Corruption exists in all societies at different scales and forms, and many countries are now confronting with it. Corruption always poses threats to the vision of a state in their sustainable development process. Although there is an awareness of the consequences of corruption on sustainable governance and development, different kinds of anti-corruption strategies are now a priority agenda in the civil society organizations (CSOs) around the world. Added to that, there is also the existence of legal, policy and institutional framework introduced to curb corruption, efforts of CSOs are largely not getting success, where autocratic and oligarchic system of government exists. Corruption even exists in democracies, but its nature and dimension is basically different from the high corruption prone in countries run by autocrats in dictatorships. Furthermore, the varying nature of political and administrative reasons in the different countries of the world has also impacted to the effectiveness of CSOs. It is worth to note that people in the whole world has seen quite a good number of citizens' movement who raised their voices for a transparent and accountable government. For instance, common citizens from the countries, including South Korea, India, Brazil, Egypt, and others, acknowledged that corruption caused incalculable damage to integrity and every fabric of their societies, therefore, demanded for an effective solution of this social menace called corruption.

CSOs have achieved some noteworthy success across the world on what should work in fighting corruption. As a justification behind the

involvement of CSOs in anti-corruption fight, when the level of trust over the commitment of government is low or declining slowly, in that case, it is essentially required to allow CSOs in the war against corruption. However, to say that if CSOs are involved in the fight against corruption, in that case, in holding government to account will be easy. Given the context, The UN Convention against Corruption (UNCAC) recognizes the role of CSOs in fighting corruption by putting pressure on governments to increase accountability and transparency, to promote free flow of information, and to encourage citizens' participation in government decision-making processes. On a particular note, the UNCAC is the only binding international legal instrument in fighting corruption, and article 13 of it says that CSOs should take part in the struggle.

However, the paper focuses on identifying challenges to the failure of CSOs in the process of anti-corruption efforts. Relying on qualitative data, the paper argues that with limited resources the CSOs are working in the war against corruption for maintaining governance for sustainable development. However, as findings in the paper, CSOs are found to be very restricted in the regulatory framework, furthermore, effective strategies lacks within or outside of the organization itself as far as their involvement in the fight against corruption is concerned. On the other hand, it is observed that the spaces for CSOs activities are highly restricted in countries run by transitional government which makes it difficult for them to enjoy the benefits of freedom of association and of assembly. However, the paper explains the failures of CSOs in fighting corruption that will be critically analyzed.

## Constitutional Framework on Civil Society

Many countries in the world in their constitutional framework provide a guideline for the activities of CSOs. For instance, the Constitution of the people's republic of China through Article 35 guarantees freedoms of association and of assembly, but in enforcing these constitutional guaranteed freedoms, the government may use discretionary power that has been mentioned in the separate law; moreover, there are no mechanisms to enforce these constitutional guaranteed rights and privileges of CSOs. The above case of state discretion in case of China can be found in many other countries in Asia, having examined the constitution of the Asian countries that have protections for rights of freedom of association and of assembly, for example, Afghanistan (Arts. 34–36); Bangladesh (Arts. 37–39); Cambodia (Arts. 41–42); India (Art. 19); Japan (Arts. 16, 21); Indonesia (Arts. 28, 28E); Kazakhstan (Arts. 5, 23, 24); Malaysia (Art. 10); Nepal (Art. 17); Pakistan (Art. 17); Singapore (Art. 14); Myanmar (Para. 354); and many others (Sidel and Moore 2015, p.4). However, it is to be noted that all of these Asian countries' constitutional framework, protection for freedom of association, and peaceful assembly are available for the activities of CSOs, but when these rights are explored into a more detailed laws and regulations, and when it comes into execution, these freedoms are determined and shaped through the discretion of the government. Note also that in some other countries, textual protection of the constitution itself provides reasons for restrictive freedoms.

## Understanding Corruption and Governance

To operationalize the concept, governance as the process and institutions by which authority in a country exercise power and manage resources effectively for the purpose of common good. By contrast, corruption is narrowly defined as fraudulent practices conduct by powerful people for their private gain. However, there are the variations on broader definitions of corruption, despite the debate; the boundary of governance system must be broader than that of corruption. Undoubtedly, governance and corruption is related, but they are different in views. The framework of governance is based on legal-rational authority which simply contradicts with any forms of corruption. Governance and corruption remain contested topic, but they have received increasing

attention in sustainable development strategies. However, to say that when the state is failed to solve crisis in governance, these failures have sometimes been used to explain the justification of involvement of CSOs in the war against corruption.

There are many models or theory that provides a conceptual clarification of corruption. Spence (2007, p. 36, cited by Al Zadjali 2010) analyzed common characteristics of different forms of corruption. When it comes to clarifying the Myth of Gyges, which is explained by Glaucon to Socrates in Book II of Plato's Republic, five factors that characterize corruption:

1. The possession of power is considered as the capacity to act in a way to bring about the desired outcomes.
2. There is disposition to purposefully exercise that possession of power.
3. There is an opportunity of exercising that power or to be engaged in exercising power in some activities.
4. There is invisibility or concealment of the actions.
5. There is a monetary or non-monetary self-regarding gain to the individual or groups.

Apart from the five Gyges model, Spence points out one more feature, that is "*...a socially pre-established fiduciary relationship of trust between the corrupt person or group and the person or persons or group who are harmed in some way by the corrupt person's or the corrupt group's action*" (Spence 2007, p. 39, Al Zadjali 2010).

Given the philosophical foundation, corruption is a secret act which is unable to coexist with good accountable and transparent system. Elaborately, there are incapacities of governance condition which may allow corruption to occur, such as political instability, bureaucratic complexity, and absence of accountable and transparent legislative and judicial systems. Hence, corruption is an important challenge to any states on which sustainable political and economic development or failure depends to a large extent on their success in eradicating it. The argument has also been echoed in a workshop on corruption in Australia held in 2010, "*Corruption is a serious challenge in the contemporary world. It undermines good government, fundamentally distorts public policy and leads to the misallocation of resources. Controlling it is only possible with the cooperation of a wide range of stakeholders*" (Al Zadjali 2010).

However, during the 1970s, economy grew stagnant, and many social scientists blamed to "government failure" for bad policies that demanded accountability and transparency on the process of governance, highlighting the importance of partnership of diverse actors in complex policy actions such as the inclusion of government as one side, and other actors as private organizations, and the CSOs and other stakeholders (Warren and Weschler 1999, cited by Dhakal 2007, p. 62), depending on the nature of the policy problems. Since then, there has been an increased number of CSOs, and also brought partnership between government, nonprofit and the profit-oriented organizations. However, CSOs can respond to many social and political ills of a country, but the nature and functions of CSOs and its co-relations with the other stakeholders can develop some challenges that weaken the performance of CSOs to further continue their advocacy programs.

## Understanding the Failure of CSOs in Anti-Corruption

Many social scientists in their research findings pointed out that the failure of contemporary anti-corruption efforts are not only the consequences of lack of resources, rather it could be blamed for the absence of multi stakeholders partnerships (MSPs) such as the absence of cooperation between the government and civil society, non-governmental organizations, and ordinary citizens and, obviously, lack of enforcing strict laws and its enforcement (Riley 1998; Robinson 1998; Kpundeh 1998, 2004; Johnston 2005; Amundsen 2006; World Bank 1994, cited by Persson et al. 2010, p. 10). This insightful finding came up with a commonly perceived notion that without

having a strong political will, campaign for anti corruption efforts are doomed to fail.

For instance, immediately after taking power, most political regimes in Africa have committed to bring the corrupt cases of their predecessors into justice, and they have also given a promise to end unethical behavior, as a part of the justification for their claim on office. Independent political analysis and expert evaluation reports from the African countries as well as from the reports published in every year from Berlin based transparency International reveal that many anti-corruption efforts in African countries are embedded in the structure of corrupt networks in their society. The other way around, political leaders often talk about the establishment of integrity in public office, but political words do not always relate into a genuine commitment towards the establishment of a model for building national integrity. That means that there is a gap between rhetoric and reality in the anti-corruption efforts. For example, many high-profile corruption scandals emerged in many countries in Africa in the recent past years, but in most cases, no prosecution has taken place seriously yet, for instance, the Goldenberg and Anglo Leasing scandals in Kenya and the Global Fund scandal in Uganda (Persson et al. 2010, p. 10). The following section analyzes to the challenges that CSOs face in the contemporary world, as they are responsible to take larger roles in anti-corruption struggles.

### Political Reasons

There are many political reasons why anti-corruption struggles do not take root in society. Having reviewed the literature, it is observed in many countries in the world, anti-corruption reform was never considered a serious attempt from the governments. Imagine that if a government simply reacts to corrupt behavior, it may not put the appropriate course of actions into the anti-corruption strategies. As a consequence, this will bring in the struggles not having any serious impacts on changing behavior of corrupt practices. For example, in 2013 when the Turkish Parliament began investigating allegations of unethical behavior of its former Prime Minister, at the beginning it looked like a zero tolerance on ending corruption in political settings. But it made clear as soon as the Turkish Parliament cleared them of these charges that fueled speculations among the ordinary citizens that the anti-corruption campaign was simply a political motive.

On a particular note, in a transitional democratic country, a government may also use an anti-corruption war to oppress opponents' views. For this kind of anti-corruption efforts, at the very beginning, citizens do not comprehend the real motives for such a political exercise. For instance, in the recent past, some south Asian countries adopted strategies including a tough anti-corruption law and setting up independent anti-corruption commission. But later on, due to the controversy of the corruption charged against its opposition leaders and their supporters, under such circumstances, citizens became quite skeptical about the true nature of the political motive, and perceived knowledge of the citizens would quickly blow the credibility of such an anti-corruption effort. In order to contribute for a further conceptual clarity, anti-corruption struggles can also be used to justify military coups to topple democratically elected governments. The recent case of Thailand, Egypt, and Zimbabwe are being ruled by military governments as a justification of the coup in the war against corruption.

In some countries, a government may be truly serious about ending corruption, but before adopting new strategies or reforms, governments do not spend much time and efforts to initiate a dialogue or consultation with other stakeholders. However, to say that earlier researchers proved that without a national consensus, even a genuine anti-corruption effort driven by a government may not be supported by the society. For instance, in Bolivia, a national anti-corruption plan drew attention by local experts on a point of departure that there had not been a wide participation in formulating the said plan. Later on, it was found that on certain points, some of the church groups resisted the anti-corruption move, as a consequence, the Bolivian government had to step back from anti-corruption struggles and compelled to organize a new policy dialogue at

national level in order to get fully consensus support against fighting corruption.

A government may genuinely start an anti-corruption agenda, but beforehand they have to make sure that opposition parties must also be on board for the war. Whenever there is a transition of power, as a consequence, the opposition will either come into power or as opposition put pressure over the government for their anti-corruption efforts. The importance of involving the opposition parties are illustrated by what happened in Japan as a case. The opposition-proposed bill on receiving goods in return for providing political favors to their citizens, even the bill, later on, mobilized to some of the members of the ruling political party to take stern action on this endeavor (UN 2000, p. 2–3).

### Administrative Reasons

Despite of political will is in place to fight against corruption, there are often failures in regards to administrative issues (in terms of time and resources), that cause to lose hope in anti-corruption efforts. For instance, it is an unfortunate reality that in many cases, countries with bad governance adapt a complete model of anti-corruption strategy from the developed economies where corrupt behavior is significantly low. Therefore, it is suggested to spend sufficient time to adapt strategies and methodology into a specific context of a recipient country. It is also worth to point out that lasting reforms are not an easy task, given the consideration; many anti-corruption defenders and experts suggest that countries must begin their nationwide exercise, which is absolutely crucial to mobilize popular support from their citizens. When it comes to formulating and disseminating regulations, and policy manuals, these activities seem to be tedious work and require huge time and resources than its anticipation. By the time, anti-corruption reforms become derailed. In summing up, the problem lies with the administrative system for failure in anti-corruption efforts should not be ignored; if they are not analyzed properly, it will have some negative consequences on the mission of its efforts (UN 2000, p. 3–4).

### Internal and External Challenges

In developing economies, the state still have a natural monopoly in providing public goods and service delivery, apart from that, the despotic state has always the tendency of maintaining bureaucratic complexity in the service delivery, and very unresponsive and slow to any societal transformation that is inherent in the philosophy of state power. When it comes to the inherent internal challenges of the CSOs, its inevitable challenges vary from authoritarian regimes to democratic governments due to the varying political structure, institutional performance, and values and norms in society. However, there are some explicit internal challenges in regards to the failures of CSOs that emerge as restricted focus in advocacy programs, shortage of resources in reaching out to citizens, fragmentation and parochialism in policy. These said challenges weaken the mission or performance of CSOs to accomplish its stated goals. Now let me share an international survey on non-profit sectors conducted by Salamon and Anheier in 1994, they found that the activities and performance of the CSOs are highly influenced by some external factors that includes regulatory system, the centralized nature of the government, and extent of social and economic development of the concerned countries (Waddell 1997; World Bank 1997; Brown and Ashman 1996, cited by Brown and Kalegaonkar 1999, p. 2–3). Now I am going focus on some external challenges of CSOs such as public legitimacy, government, and business relations.

#### Public Legitimacy

If a state has a long history of public acceptance of CSOs, their advocacy programs and opinions are generally respected. In India, for example, many voluntary organizations working on social problems have institutional history going back centuries, and there have been substantial popular support for their activities. In many other countries, however, there is relatively little public understanding or recognition of the legitimacy of CSOs. Without the mass support or acceptance, other sectors in the state machineries can challenge to the activities of CSOs. Even sometimes the vulnerabilities are observed within the CSOs (Brown and Kalegaonkar 1999, p. 5).

There is no denying the fact that public legitimacy is associated with the existing legal framework, and its system of regulation that establish rights of CSOs. In other countries, support for civil society is "*limited by the lack of clear, coherent, and supportive regulations*" (CIVICUS 1997, cited by Brown and Kalegaonkar 1999, p. 5). In the absence of government recognition, CSOs does not get any safeguards against arbitrary decisions and actions by state actors. NGOs in Bangladesh, for instance, have been subject to arbitrary rulings, and even cancellation of their registration, when state actor find them posing threat to the interests of the regime (Bebbington 1997:1758).

### Government Policies

Relationship between CSOs and the government always presents conflicting in nature in many transitional democratic countries. It is commonly observed that despotic state is deeply doubtful about the activities of the CSOs. To the state actors, activities of CSOs can be considered a potential competitor in providing service delivery to the electoral constituents and relate them as a major critics of government policies and actions. The state actor also felt afraid of channeling assistance to CSOs received from international donors, or CSOs may act as whistleblower of bad public policies and actions. Summing up, CSOs may initiate a wide range of strategies in dealing with bad governance, but there is a deep mistrust in the countries run by autocratic regime where power of the state is highly centralized.

### Business Sector Relations

The question is about joint working between the CSOs and with business sector that is determined by the perceived notion of both sectors. In general, business sector does not influence to any advocacy programs of CSOs, but they will create obstacles over the functionaries of the sector as soon as they found them as a potential threat to their self-regarding business interests. For example, in many countries, there are some CSOs who are involved with consumer advocacy rights for stopping business development projects; in that case, there are ample evidences that anti-corruption efforts of CSOs may find themselves subject to persuasion, pressure, and at the final stage outright coercion (Brown and Kalegaonkar 1999, pp. 6–7).

Donor countries are now quite aware of the potential role of CSOs in the democratic transition process. CSOs are, in many countries, considered a foreign aid funding model or prescription. Authoritarian governments always attempt to present CSOs with the societal realities of their countries that can pose serious challenges and interrogation to the activities of CSOs. Apart from this, in many countries, where CSOs are dominated by foreign assistance, and the programs are endorsed by the donors, CSOs can easily be portrayed as an agent for fulfillment of foreign agenda. In that case, the state may easily question the legitimacy and identity of CSOs, and then they are considered as new "imperialist" to state sovereignty. So, if CSOs somehow fails to link up their programs and activities to the local values and ideals, then it is easily perceived as illegitimate as on a national ground. Furthermore, with an excessive dependence on foreign support and their assisted programs can challenge to the identities of CSOs in the eyes of skeptical national observers and political analysts.

## Conclusion

It is concluded that CSOs intends to play a catalytic role in the war against corruption, but in order to meet the requirement, CSOs will have to develop their internal capacity and resources in order to encounter with these discussed challenges. In brief, this article has explored some political and administrative factors and issues that affect the performance of CSOs in regards to anti-corruption struggles. It also analyzed some of internal challenges that emerged from the consequences of the nature of the CSOs that includes limited focus and scarcity of resources. It also examined some external challenges that are embedded with the relationship between CSOs and with other sectors, including regulatory framework and its relations with the government, the business, and the global contact.

# Governance and Corruption in India

Sujata Balasubramanian
Division of Social Science, Hong Kong University of Science and Technology, Hong Kong, China

## Definition

Governance: "The set of traditions and institutions by which authority in a country is exercised. This includes (1) the process by which governments are selected, monitored, and replaced, (2) the capacity of the government to effectively formulate and implement sound policies, and (3) the respect of citizens and the state for the institutions that govern economic and social interactions among them" (World Bank 2016). Since 1996, the World Bank has also published a set of indicators which attempt to measure six key dimensions of governance – political stability, control of corruption, governmental effectiveness, the extent of the rule of law, regulatory quality, and finally, voice and accountability.

Corruption: Transparency International defines corruption as "the abuse of entrusted power for private gain."

## Introduction

When evaluating the quality of governance in India, most observers appear to agree that the country has succeeded in promoting democratic participation and freedom of expression, especially in comparison to other developing countries. For the most part, India has also managed to preserve the rule of law and political stability – a notable achievement when considering the variety of different ethnic, religious, and linguistic groups that make up this multitudinous democracy.

On the other hand, both control of corruption and, even more critically, government effectiveness have been identified as major weaknesses. This lack of effectiveness is manifested in various ways, including the failure to develop basic infrastructure, as well as glaring deficiencies in the delivery of essential social services. For example, with regard to child immunization, a common indicator of the quality of public health provision, while other developing countries are making progress, India may even be regressing. The third round of the National Family Health Survey reported that the percentage of fully immunized children had fallen in several large states between 1999–2000 and 2005–2006, and data from a 2011–2012 survey seems to show that there was a declining trend for the entire decade of the 2000s.

The challenges of governance in India are thus irretrievably linked to the critical, developmental problems faced by the country – malnutrition and poor health, illiteracy and low levels of education, as well as widespread poverty. In 2014, the country ranked 130th out of 188 countries on the United Nations' Human Development Index, which provides a composite measure of average attainment on three dimensions of a country's development – per capita income, education levels, and life expectancy. This rank is far lower than that of other large developing countries such as Brazil (ranked 75th) or China (ranked 90th). Even within the South Asian region, India's average life expectancy is, at 68 years, lower than that of either Bangladesh or Nepal, both of which have much lower per capita income levels. India has seemingly been unable to translate the benefits of political stability and participatory democracy, as well as relatively rapid economic growth since the 1990s, into commensurate improvements in the well-being of its citizens.

## Federalism and Politics

After gaining independence from Britain, India adopted a Westminster-style parliamentary system, with two houses of Parliament – the Lok Sabha or lower house and the Rajya Sabha or upper house. Elections to the Lok Sabha are held every 5 years, for single-member constituencies, using a first-past-the-post voting system. India has built a strong tradition of electoral democracy, with free and fair elections resulting in orderly changes of government, for almost the entire seven decades since its independence in 1947. While this does confer a degree of legitimacy on elected governments, flagrant corruption, among both politicians and public officials, has seriously undermined this authority. Consequently, even democratically elected representatives are not perceived as either impartial or necessarily working for the good of citizens or the progress of the country.

Moreover, electoral politics, even at the national level, has been driven to a considerable extent by the demands of multiple interest groups competing for largesse from the state in the form of job reservations, subsidies, or other handouts. Rather than emphasizing broad objectives such as economic growth, or even attempting to attract voters using class-based arguments, political parties have often attempted to appeal to voters using caste, religion, language, or other narrow grounds. This identity politics is typically tied to the provision of privileges for specific groups, further diluting the legitimacy of elected governments.

The Indian federation was not the result of a voluntary "coming together" of existing political entities at the time of independence from the British, but rather was imposed from above. In order to ensure the stability of the emerging nation, the framers of the Indian constitution were in favor of a very centralized power structure. Power was vested to a much higher degree in the hands of the national government (the "Centre") as opposed to the regions or provinces (the "states"). The Indian federal system also includes a number of "union territories" which are geographical units directly administered by the central government.

The states have no freedom to secede from the union, and the Indian constitution makes it clear that even advocacy of secession is not protected by the right to freedom of expression. The Centre even has the power to unilaterally alter the boundaries of a state, through a simple majority in the national Parliament. Moreover, this power has been used quite frequently to meet the demands of various cultural, ethnic, and linguistic groups for greater self-determination and cohesiveness. The pressures of electoral politics have compelled parties governing at the Centre to accede to such demands, since they must compete in state elections against regional parties, which may make appeals to local identities and sentiments.

The first major restructuring of state boundaries, mostly on a linguistic basis, was carried out by the Indian Parliament in the fifties: the States Reorganization Act of 1956 reduced the number of states from twenty-seven to fourteen. In the six decades since then, there have been increasing and vociferous demands for greater

autonomy from various groups, including calls for secession. In response, the boundaries of states have been redrawn several times, and some union territories have also been upgraded to the status of states. In January 2017, therefore, the republic of India consisted of twenty-nine states and seven union territories.

The Indian Constitution specifies the distribution of legislative and administrative powers between the Centre and the states in three lists – the Union list, the State list, and the Concurrent list. Only the central government is entitled to pass laws on all subjects contained in the Union list – such as national security and defense, nuclear energy, and foreign affairs. State governments have control over and sole authority to pass legislation on subjects in the State list – such as agriculture, the police, and public order. While both the states and the Centre can legislate on subjects in the Concurrent list, in the case of any conflict between these laws, the legislation passed by the Centre takes precedence. All residual powers are vested in the Centre, and, in times of crisis or emergency, the Centre is also entitled to pass legislation on any subject in the State list.

Similarly, with regard to taxation, the Centre and states are entitled to levy taxes on all sectors covered by the Union and State lists, respectively; there are no powers of taxation linked to subjects on the Concurrent list. In addition, every state is also entitled to receive a share of all Central taxes deriving from the Union List, based on the recommendations of an appointed Finance Commission. The Finance Commission is expected to achieve an equitable distribution of tax revenues between the Centre and the various states, after taking into consideration their levels of economic development and relative performance. States may also receive grants, as well as loans, from the Centre. Perhaps inevitably, political considerations have crept into these fiscal arrangements between the Centre and the states, and the political party in power at the Centre has often been accused of favoring states which are also governed by that party.

Much of the money transferred to states is related to what have been termed 'Centrally sponsored schemes' – schemes largely funded by the Centre, but implemented by the states, and related to subjects included in the State List. In effect, they represent attempts by the Central government to get the states to prioritize certain issues. There were almost 150 such schemes in the first half of the current decade, with the number being drastically reduced to 30 schemes after 2015 (partly through the merging of some schemes).

With both guaranteed revenues from the Centre and independent revenue-raising powers, state governments have had a high degree of autonomy with regard to the implementation of development schemes, and also substantial room to design their own initiatives. Accordingly, there has been considerable variation in the patterns of regional development, which are often directly related to the quality of governance at the state level. For instance, there is a striking difference in developmental outcomes between the four Southern states (Tamil Nadu, Kerala, Karnataka, and Andhra Pradesh) and the Northern states, especially the states of Bihar, Madhya Pradesh, Rajasthan, and Uttar Pradesh (collectively referred to by the derogatory acronym 'BIMARU' states).

Kohli and Singh (2013) point out that health and education indicators in the four Southern states are at par with those achieved by industrialized countries, whereas the BIMARU states have social development indicators worse than the countries of sub-Saharan Africa. They emphasize that while initial conditions and the extent of economic growth can explain part of the difference between the two regions, the key distinguishing factors may lie in both the nature of politics and the extent of politicization of the bureaucracy in these states. They suggest that Southern political parties were able to generate more broad-based support from lower castes and classes which encouraged them to pursue poverty reduction and other populist policies to a much greater extent than parties in the Northern states. Moreover, bureaucracies in the South were less politicized and therefore retained a much stronger sense of public purpose, leading them to be more professional and efficient when it came to implementing welfare schemes (Kohli and Singh 2013).

## The State and the Economy

India has often been unfavorably compared to China and other East Asian countries, where the state has played a much more active role in spearheading growth and development. For instance, in South Korea and Taiwan, land reforms were undertaken in the initial stages of development, which raised income levels in the countryside and laid the foundation for the structural transformation of these economies. In India too, given the huge inequalities in income and land ownership in rural areas, land reforms could arguably both have alleviated rural poverty and raised agricultural productivity levels. However, despite enacting a great deal of legislation, India failed to implement substantial land reform, especially in terms of redistributing land to the landless. This has been attributed to the fact that the Congress party, which was the dominant political party at both the Centre and in most states until the mid-sixties, relied on large landowners to mobilize votes for it in rural areas. Despite the passing of land ceiling acts in many states, which legally limited the permissible size of landholdings, large landowners were mostly able to use their political influence to resist attempts to take over their excess or surplus landholdings (except in a few states like West Bengal and Kerala).

In terms of coordinating the process of industrialization too, the Indian state has not demonstrated the kind of strength shown by East Asian governments, which were able to shape and control business interests to serve policy ends. In the early stages of India's development, a very direct and ambitious role was envisaged for the state, in keeping with Prime Minister Nehru's vision of a self-reliant economy, based on central planning, in which the public sector would occupy the "commanding heights." The Industrial Policy Resolutions of 1948 and 1956 gave public enterprises a monopoly in certain sectors of the economy such as atomic energy and aircraft production, as well as in railways, coal, mineral oils, iron and steel, shipbuilding, and telecommunications. All remaining industries were to be open to investment by both the state and private enterprises in this 'mixed economy' model.

The government therefore had a direct impact on the private sector through its role as the almost sole supplier of crucial inputs such as steel, coal, and later petroleum, as well as its monopoly in power, railways, airlines, and telecommunications. After the nationalization of most banks and insurance companies (by 1969), the public sector was also the chief source of finance for private companies, and its policies on interest rates and the pricing of inputs directly affected the profitability of private firms. With its towering presence in the economy, the public sector was also an important source of demand for the products of the private sector, especially capital goods.

Moreover, to monitor and control the activities of private companies, the government enacted comprehensive legislation which ensured that practically all decisions made by private firms – on setting up a unit, expanding, pricing, distribution, etc. – required government permission. No new undertaking could be set up or any existing one expanded without securing a license from the government. In addition, all transactions with the international economy were regulated through tariffs and import quotas, exchange controls, and restrictions on foreign investment. All imports other than those covered by the Open General License required an import license as well as foreign exchange clearance.

This pervasive government regulation encouraged the growth of corruption related to 'rent seeking'. The term 'rent seeking' comes from the economic concept of 'rent', which is the part of the profit earned by the sellers of a good (or factor of production) that derives from the relative scarcity of that good or factor. For example, government restrictions on the quantity of vehicle imports will drive up the price of imported cars in a country, creating 'rents' (higher than normal profits) for the sellers of these foreign cars. Sellers then have an incentive to devote time and resources to securing import licenses through lobbying and may also resort to outright bribery: thus 'rent seeking' is both an unproductive form of economic activity and can also result in active corruption as bribes are paid to officials in order to secure rents.

While it was intended to avoid the wasteful over-production of goods generated by a free-market economy, the system of industrial licensing in India created exactly the opposite problem – artificial shortages of a wide variety of goods. Once licenses had been issued to companies for the establishment of factories with a total specified production capacity of a particular good, no further licenses were issued for the production of that good: this was irrespective of whether the factories actually began producing and selling the good in question. This system made it lucrative for large business conglomerates to invest in securing licenses to produce a wide variety of goods, simply as a way of cornering the market and keeping competitors out.

The procedure for securing a license was both lengthy and cumbersome with applications being vetted by as many as 30–40 officials spread across various ministries and government agencies. Given multiple and sometimes contradictory criteria for project selection, these bureaucrats had vast, discretionary powers, and many of the larger companies maintained substantial 'industrial embassies' in the capital, New Delhi, in order to plead their cases more effectively with these officials. Lobbying and liaison activities by companies often involved under-the-counter payments to both bureaucrats and politicians, with amounts paid depending on seniority as well as the importance of the project. Smaller firms, which could not afford to spend as much on lobbying, lost out in the race to secure licenses. The licensing system thus benefited the larger business houses, as well as politicians and bureaucrats.

While the licensing system acted to limit domestic competition, import quotas, combined with extremely high rates of customs duties, gave producers considerable protection from foreign competition. The underlying argument was that 'infant' industries, in new sectors, required protection for an initial period so that they could develop and become competitive. However, attempts at liberalization of this state-directed system only began about three decades later, in the 1980s, and gained traction in 1991. Since larger Indian businesses had benefited from both the protected domestic market as well as the subsidized provision of credit and other inputs from the state, there was substantial resistance from business leaders to those aspects of the reforms which required them to give up some of these benefits. In particular, there was considerable opposition from domestic business groups to the lowering of tariffs on imported goods and the opening up of the domestic market to foreign investment: these aspects of the liberalizing reforms proceeded much more slowly, with significant restrictions still in place as of 2016.

Along with attempts to liberalize the economy, successive governments have also made attempts to simplify the administrative procedures which companies have to comply with, and reduce the amount of related paperwork. Nevertheless, in 2016, India was still ranked 130th out of 190 countries by the World Bank on an 'ease of doing business' indicator.

## Experiments in Governance

In attempting to increase the welfare of the more remote, rural, and impoverished parts of the country, the Central government has occasionally experimented with new approaches to governance. Two experiments which are worth noting are the decentralization of power through the Panchayati Raj Institutions Act and the simultaneous reservation of seats in local government for women. Together, these initiatives have the potential to engender significant change in the country over the longer term.

Although the Indian constitution had originally proposed some devolution of powers to local governments at the sub-state level, this was left to the discretion of state governments. In practice, therefore, power remained highly concentrated at the levels of the Central and state governments for well over four decades after independence. A few states did, however, take steps towards decentralization, based mostly on India's traditional mechanisms of local government.

By tradition, India had had a form of local self-government in the villages in which *panchayats* consisting of a group of five male elders, would meet to discuss village affairs and settle disputes

(the term *panchayat* literally means an assembly or gathering of five people). The 73rd amendment to the Indian constitution, ratified in 1993, required all states to enact or amend existing legislation related to the panchayats to institute a new system of local government in rural areas. The *gram* or village was to be the basic unit of this system, which would comprise elected representatives at both the village and district levels (the district is the administrative unit one level below the state or province in rural areas). If deemed necessary, there would also be a third, intermediate level of government between the village and the district. The system was thus expected to have a three-tiered structure in the larger states and a two-tiered one in smaller states. This structure, along with its associated advisory bodies, is commonly referred to as the Panchayati Raj Institutions (PRIs).

All local governments were to be directly elected for a term of 5 years, and an independent Election Commission was set up in every state to supervise this process. It was hoped that this process of political decentralization would encourage more direct participation by citizens in the formulation and execution of development plans at the grassroots levels, thus ensuring greater accountability and better developmental outcomes. In particular, greater participation by previously marginalized social groups such as women and people belonging to the scheduled castes and scheduled tribes was expected to lead to a more equitable sharing of the benefits of economic progress, furthering the cause of social justice.

Specific mechanisms were put in place to facilitate these outcomes. At the village level, a *Gram Sabha*, consisting of all adults registered to vote in the *Gram Panchayat* elections, was constituted as a sort of supervisory council. These *Gram Sabhas* were mandated to meet regularly and to scrutinize the reports and accounts presented by the elected *Gram Panchayats*. They were also required to approve all village-level development projects prior to implementation, as well as to identify the beneficiaries of national, antipoverty programs. These measures were expected to improve the targeting and delivery of antipoverty programs, as well as making development projects more responsive to the felt needs of local communities.

In order to encourage greater female participation, one-third of all seats in the newly created village panchayats were reserved for women, as were one-third of the positions of the president of the *Panchayat*. While it was feared that seat reservations for women would be just a token gesture, with female leaders becoming either puppets of locally powerful players or mere mouthpieces for their male relatives, the accumulated evidence of over twenty years seems to show that this has not been the case.

Despite anecdotal suggestions of tokenism, research has shown that women leaders appear to have their own views and initiatives and to become increasingly competent after they have gained a few years of experience – to the point that they are at least as effective as their male counterparts. Female leaders may also prioritize issues which are of greater importance to women, and deliver more of the types of public goods valued by females. Other positive effects of the female quotas appear to be a greater willingness of other women in the village to speak up in meetings, as well as a higher likelihood that crimes against women are reported. In spite of the noticeable success of these leadership quotas for females, however, attempts to expand this initiative to seat reservations for female leaders at the state and national levels have so far been stalled.

As an exercise in political representation, the new system of local government may be viewed as a success: elections have been held regularly every five years, and the quotas for women and other marginalized groups have had a definite impact in raising the social status of these groups. In terms of other substantive outcomes, however, the record is more mixed. While financial transfers to local governments have increased substantially in the past two decades (in addition to their oversight of the spending related to the national antipoverty programs), much of this money is earmarked for particular projects. Local governments are also severely limited in their ability to raise revenues by levying taxes.

Additionally, moves towards administrative decentralization, in terms of making bureaucrats

accountable to the local government, have been resisted both by state governments and the civil service. Finally, problems of capture of resources and power by local elites as well as by dominant political parties are widespread, limiting the impact of these reforms in empowering the poorer and weaker sections of rural society.

## The Battle against Corruption

In India, political corruption often takes place on a grand scale, with thousands of dollars in kickbacks from contracts for all kinds of government procurement ('kickbacks' refer to the practice of suppliers making undeclared payments to those who help them secure a contract – often the same politicians and officials responsible for awarding the contract). These instances tend to be highlighted by the media and, relatedly, generate the most public anger. A massive public outcry, for instance, surrounded the uncovering of corruption related to the Commonwealth Games hosted by India in 2010.

From the point of view of government effectiveness, however, an even more worrying form of corruption may be the hierarchical and multilayered corruption *within* the bureaucracy, of the kind documented by Robert Wade. Wade (1985) describes in detail how the transfers of engineers in the Irrigation Department of an Indian state were based on a system of corrupt payments which went upward from junior to senior officers and were ultimately recovered from the farmers who paid for the irrigation services.

Ordinary citizens are most familiar with the more small-scale, 'petty' corruption which can, in some regions, permeate almost all their interactions with government officials. This has often become institutionalized to the point where there are standard, commonly known rates and charges for particular transactions. Because of the routine and predictable nature of these payments – almost like a sales tax for a retail transaction – this is sometimes referred to as 'retail corruption'. In most cases, however, these bribes are coercive, in that the giver of the payment is legally entitled to the good or service and is forced to pay a bribe in order to receive it.

Two of the more common examples of voluntary or collusive payments by citizens involve bribes to taxation authorities in order to avoid paying taxes and kickbacks by businessmen securing government contracts. In both cases, the act is illegal, and both parties gain from the transaction – it is the public which loses. By not contracting the supplier who offers the best terms, for example, the government is wasting public money. In the case of tax evasion, too, vast sums of money may be lost to the public exchequer. However, according to an estimate by the World Bank in 2007, the size of the 'shadow economy' in India as a percentage of official GDP was only 20.7%, which compared favorably with the average of approximately 31.3% for the 151 countries in the sample. The 'shadow economy' has been taken to mean "all market-based legal production of goods and services that are deliberately concealed from public authorities" – the concealment may help to evade taxes, or circumvent labour regulations, for example (See World Bank 2010).

'Speed money' (a bribe or payment used to speed up the administrative process for what may be an entirely legitimate transaction, e.g., getting a telephone connection or a driving license more quickly) may also fall under the category of voluntary/collusive payments if it is given willingly. It has frequently been argued that where administrative procedures are needlessly lengthy and cumbersome, this kind of bribe may actually increase economic efficiency by persuading officials to expedite or skip unnecessary processes. However, such payments can also become coercive if bureaucrats deliberately create delays in order to force service recipients to pay bribes – what has been termed a 'harassment bribe'.

The former Chief Economic Adviser to India's Department of Economic Affairs, who coined the term 'harassment bribe', has argued that this kind of corruption by public officials can be reduced by amending Indian law to make only the *taker* and not the *giver* of the bribe subject to prosecution (Basu 2011). Currently, under India's Prevention of Corruption Act, both parties to a harassment

bribe are subject to punishment, including imprisonment, for anywhere between 6 months and 5 years. Basu (2011) argues that amending the law would encourage the bribe-payer to denounce the bribe-taker once the transaction had been completed, thereby also dissuading the bribe taker from taking the money. He suggests that the incentive to the bribe-giver to denounce the bribe-seeker could be further increased by refunding the amount paid as a bribe.

In the battle against corruption, one notable victory has been the enactment of a national Right to Information (RTI) Act in 2005, partly as the result of a grassroots movement spearheaded by the National Campaign for People's Right to Information. The passing of the national law was preceded by the enactment of similar laws by several different states. The law entitles citizens to file applications for information from all public entities, which are required to respond within a period of 30 days (in cases involving the life or liberty of citizens, the deadline is 48 h).

The number of applications filed under the RTI Act now runs into the hundreds of thousands each year, with requests for information on a wide range of subjects. The Act is widely believed to have helped ordinary citizens to secure their rightful entitlements from the government and to have forced public officials to be accountable for their performance. It has also been credited with helping to expose major corruption scandals such as those linked to the Commonwealth Games (mentioned earlier), the sale of 2G telecom spectrum licenses, and the sale of flats in a cooperative housing society in Mumbai (the exposure of this last scam actually caused the resignation of the Chief Minister of the state).

Grassroots protests against corruption in 2011, led by the social activist, Anna Hazare, also pressurized the government into enacting a Lokpal (Ombudsman) Act which was passed in 2014. While the provisions of this Act were considerably less stringent than the demands made by civil society groups, it did require all public servants to make annual declarations of their income and assets.

Apart from these measures pushed for by civil society, governments at the Centre have also proactively initiated measures to improve governance. This has often involved a reliance on technology to remove or reduce the number of intermediaries in a transaction or to close other loopholes which make corruption feasible. For example, the recently introduced *Aadhar* identification scheme proposes to use biometric markers to uniquely identify all citizens, which can, among other things, help to reduce fraud. Relatedly, the current government proposes to provide various benefits in the form of cash transfers made directly to beneficiary bank accounts, so as to reduce the scope for corruption by intermediaries. It remains to be seen whether these technical fixes can significantly reduce corruption in public schemes or whether it will simply take another form, as argued by sceptics.

Administration; Equality; Rule

## Introduction

Governance and democracy are important issues to understand the politics of any state. In the community of nations, governance is considered and treated as "good" and "democratic" to the degree in which all the institutions and processes of state are accountable, transparent, and effective. Governance is always responsible to make the unique and necessary decisions or policies for a given political system, a state, or an organization. Democracy is one of the legal ways of governance of state. Bryce says, "Democracy is that form of government in which the ruling of a state is legally vested, not in any particular class or classes, but in the members of the community as a whole" (Bryce 1929). Actually there is a reciprocal relation in between governance and democracy. When we relate governance to democracy, then it refers the democratic governance that ensures mainly participatory governance, upholding of human rights, eradicating poverty, and ensuring gender equality, accountability, responsiveness, efficiency, and effectiveness of government actions. Democratic governance is the earnest expectation of the citizens of any state. People are strongly inspired by democratic ideals and values. For the significant role of governance nowadays, it has become one of the most household words in political issues. Mostly a post-cold war development, the governance discourse is more connotative and inclusive than the traditional concept of government (Islam 2016). Now the term good governance is used in political and governance studies as the latest fashion of governance. Good governance encompasses a broad reform strategy to strengthen the state institutions where government is more responsible, more open, more dedicated, and more democratic. Peoples expect equity, transparency, accountability, independent judicial system, rule of law, and fair election system in a manner that is effective, efficient, and sustainable to the democratic governance.

## Meaning of Governance

Governance is a theoretical concept referring to those actions and processes, by which sustainable practices of organizations arise, continue, and persist. These actions and processes may operate in formal and informal organizations of any size; and they may function for any purpose, for good or evil, or for profit or not. One can apply the concept of governance to states, to corporations, to nonprofit, to NGOs, to partnerships and to other associations, to business relationships, and to social, cultural, and any other human-engaged activities. The World Bank defines governance as "the manner in which power is exercised in the management of a country's economic and social resources." The Bank refers to the three aspects of governance: (i) the form of political regime, (ii) the process by which authority is exercised in the management of a country's economic and social development, and (iii) the capacity of government to design, formulate, and implement policies and discharge functions (Weiss 2000). In a report in 1997, the UNESCO recognizes governance as a process whereby citizen needs and interests can be articulated for the positive social and economic development of the entire society and in the light of a perceived common good. Governance means more than government; it refers to a political process that encompasses the whole society and contributes to making citizen's active contributors to the social contract that bind them together. This sense of political efficacy is one of the indicators of democratic governance (Ahmed 2004). According to the International Institute Administrative Sciences, "governance is a process whereby elements in society wield power and authority and influence and enact policies and decisions concerning public life, and economic and social development" (Weiss 2000). The USAID considers governance as an element of the democratic process. It is in favor of a strong state which will be able to provide essential services and support the private sector while remaining free from corruption and arbitrariness (Guhathakurata and Karim 1998). Nowadays governance promotes equity, participation, pluralism, transparency, accountability, democracy, and the rule of law in a manner that effective, efficient, and enduring. Governance is many bases of its verities natures, such as corporate governance, participatory governance, regulatory governance, etc. Corporate governance consists of the set of

processes, customs, policies, laws, and institutions affecting the way people directly administer or control a corporation. Participatory governance focuses on deepening democratic engagement through the participation of citizens in the process of governance with the state. The idea is that citizens should play more direct roles in public decision-making or at least engage more deeply with political issues. Regulatory governance reflects the emergence of decentered and mutually adaptive policy regimes which rests on regulation rather than service provision or taxing and spending. Besides these at present, contract governance, information technology governance, land governance, environmental governance, etc., are more familiar.

## Democracy: A Theoretical Issue

Democracy has been defined by different political scientist and writers in their own ways. Some have stated democracy as a system of government, a system of society, and a way of life. Some writers and political scientist are reluctant to consider democracy as a system of government; rather according to them, it is mainly a method of determining the rulers through an electoral process. Democracy refers to such an institutional arrangement by which people can participate in political process freely. It means fair and equal treatment of everyone in an organization and their right to take part in making decisions (Goswami 2005). But it is also true that all the people of the state or majority of the population cannot take part in ruling process. And it is never possible. In this connection, Professor R. M. MacIver says, "Democracy is not a way of governing, whether by majority or otherwise, but primarily a way of determining who shall govern and broadly, to what end" (MacIver 1965). Regarding the future of democracy he also says, "Democracy is a form of government that is never completely achieved . . . democracy grows into its being." Professor Carle. J. Friedrich has pointed out that "democracy presupposes a fundamental agreement as to the methods by which political and social changes shall be brought about" (Friedrich 1950). Lord President Abraham Lincoln has defined "Democracy is a government of the people, by the people and for the people." Democracy is "a state where political decisions are taken by and with the consent or the active participation even, of the majority of the People" (Parveen 2001). What is important about democracy is that it espouses certain values which are fundamentally different from the values upheld by any form of dictatorial government.

## Historical Aspect of Democracy

In different periods of history, democracy connoted different things to different political philosopher and scientists. In ancient Greece particularly, the city state of Athens symbolized the concept and working of direct democracy which could not work for a long time, and with the demise of Socrates, Athenian democracy received a serious blow which made his disciple, Plato, critical of democracy was reflected in his political philosophy. Although Aristotle became the ardent advocate of constitutional government, democracy, and sovereignty of law, after his death democracy started to decline. The Roman system was another version of representative government, known as the republic, and in this system, there was also no room for women, slaves, and teenaged children. After declining that stage of democratic governance, it was further established in the seventh century under the leadership of the last Prophet of Islam. At the middle age of the history of political thought, Arab Social philosopher Al-Farabi spoke of liberty, equality, and rule based on the consent of the governed (Safty 2003). The idea was further sharpened by T. H. Green and John Stuart Mill in the nineteenth century. Most of the modern writings of the democracy, therefore, owe a great deal to their democracy in Europe and in the United States. It was flourished on basis of the philosophical writings of renowned philosophers and political scientists there. And then democracy was possible especially after the French revolution and American declaration of Independence.

## Governance and Good Governance

Governance has been the focal point for appreciation and condemnation from the day state was formed, and nowadays, good governance has become the matter of great concern, but the long recorded history of organized sociopolitical life of human being witnessed that it is not a new concept at all. Human concern with governance is as old as civilization itself, and it has been in the literature on politics since the days of Confucius, Plato, and Aristotle. However, good governance as a prime condition of politico-administrative modernization gained wider currency in the near past. The World Bank that is the pioneer of "good governance" concept in the late 1980s called for a focus on governance for development. Good governance is an elusive concept, a fashionable term, and a dynamic concept which refers qualitative one. Different people have stated it in different ways (Rahman 2007a). Actually, good governance requires an effective executive, a functioning legislature, and an independent judicial system. Consequently it is noted that good governance requires effective democratic governance. Good governance ensures the legitimacy of power of the government which gives emphasis on some important matters and attributes as accountability, transparency, empowerment, participation, sustainability, capacity, equity, and justice. European Union stated that "Good governance is the transparent and accountable management of human, natural, economic and financial resources for development." United Nations Development program defines it as, good governance is the existence of a network of institutions of government to exercise the economic, political and administrative authority to manage a country's affairs at all levels.

## Conditions for Success of Democracy and Governance

To make the democracy a success in governance, it needs to fulfill the certain determinates. Juan Linz and Alfred Stepan argued that five interrelated conditions exist in democratic governance. First, the conditions must exist for the development of a free and lively civil society. Second, there must be a relatively autonomous and valued political society. Third, there must be a rule of law to ensure legal guarantees for citizens' freedoms and independent associational life. Fourth, there must be state bureaucracy that is usable by the new democratic government. Fifth, there must be an institutionalized economic society (Linz and Stepan 1996). Advancement of literacy rate, establishment of separation of judiciary, increasing human resource development, arrangement of periodical election, establishment of women empowerment, increasing of per capita income of citizen, etc., are the prime conditions of democratic governance. It is noted here though Britain is called the motherland of democracy, it was not come in a day there. It had to overcome thousands of barriers and obstacles to be the model of democratic excellence. From the experiences of democracy in developed areas, it is indicated that democratic values depend on enlightened and educated nation; human consciousness; spirit of cooperation and coexistence; equality; tolerance; practice of moral and ethical values; spirit of patriotism; disciplined and sound party system; social, political, and economic security; good administration; effective law and order situation; independent, free, fair, and periodical electoral system; capable leadership; effective parliament; etc. Political analyst and political scientist are unanimous that these are the essentials or prerequisites of democratic governance.

## Present Challenges of Democratic Governance

At present, all the internal and external actors of politics, administration, and development of most of the countries of the world are emphasizing the need for good governance and democracy. But the actual picture of democracy and governance in those countries do not prove to be good and satisfactory. Politics is gradually becoming muscle man business because of weak administration. Most of the political parties create the situation of confrontation, and they often instigate

violence. The ruling party and the opposition parties often complain to each other on various political and nonpolitical issues as well. Opposition parties complain that the government is using state machinery to repress opponents. Similarly the ruling party complains against the oppositions that they create the undemocratic situation in state and violate the rules of laws and order. Sometimes nations are divided into many segments on political and religious issues. Similarly all the political parties are divided and deviated from each other based on these contradictory issues. Regarding religion's role in politics, most of the political parties are being degenerated. As a result, most of the political leaders have been dominated by different ideologies which create the situation of arrogance, enmity, and intolerance in overall sociopolitical environment. It has also made permanent division in political arena, and that also creates obstruction of democracy and governance.

Corruption and politicization are the major problems and hindrances toward development, governance, and democratic goals. Bureaucracy, judiciary, and other important governmental and state institutions are also affected by these. Massive corruptions are the result of the absence of the rule of law. Corruption is being continued in most of the countries in various degrees and tempos because of evil, unethical, and immoral practices of some politicians, business personnel, as well as some governmental and nongovernmental employees. Besides these, sometimes the bureaucratic and governmental interference to each other creates great problems in governance system. Maladministrative policy and functions are the causes of nepotism which attributes corruption and create challenges for practicing democratic values as well as expected governance.

Tolerance is a crying need for establishment of democratic governance in every political system. Leaders of political parties and activists profess a belief in the principles of democracy, but most often they are unwilling to tolerate opponents' views. Always they try to defeat each other. In fact intolerance in political life has been increased day by day in state politics and governance. The democratization process, rather than achieving greater tolerance, seems to have created a new culture of political intolerance where there has developed a high level of enmity and strong sense of seeing political opponents as threats. In such an environment, peaceful resolution of conflict and coexistence of opponents becomes difficult. Most of the political leaders in third world countries are not tolerant to each other. Often they do not show respect to those who belong to a different ideology of politics. Political leaders here most of the times are disintegrated even on important national issues. Political beliefs, attitudes, and behavior are most important in the functioning of governance and democracy. A peaceful resolution of conflicts cannot be occurred without political tolerance. Coexistence of contending views in governance system may accelerate the state in the wrong way. As a result, the system of democracy degrades and leads to instability and disharmony in all functions of the state.

Political parties are inevitable and the key agents of the democratic process. Without the existence of political parties, it is impossible to practice democratic values in governance. Basically political parties provide the essential links between citizens and government that help to function the governance according to the democratic principles and ideologies. But there is a widespread realization that if the internal practices and the procedures of the political parties are undemocratic, then it will be difficult to establish democratic governance.

Though ethics and values are prerequisites of establishing democratic governance, the contemporary politics of the world suffers from a deep and inescapable element of tragedy on account of not practicing these in politics. Most of the political leaders act for their personal and party interests. The actions which they undertake in the name of people or country often violate their most valued moral principles. Not only the political leaders but also people in our society rarely care for morality, ethics, and values. The immoral

activities of citizen are also the causes of practicing undemocratic activities.

## Conclusion

Political parties have a great role and responsibilities for the establishment of democracy, making the parliament effective as well as to avoid the confrontational natures of politics. The government also should have the ability and proper efficiency to make the parliament more attractive and effective. A corrupt leader can never produce ethical activities. Similarly an unethical leader can never produce any moral valued activities. So, leader should be ethical, moral, and principled. And when these leaders direct the society with all these values, they will be honored.

At the end of discussion, it can be said that the leaders of political parties should have the proper initiatives of establishing democratic values in all spheres of governance. The need for reforms in political parties at this stage of democracy in world politics is felt more urgently than ever. Emphasis needs to be given to reform of political parties so that they are able to grow and act as responsible and accountable institutions doing good to the people. However for acquiring the certain levels of democratic goals and governance, the following steps may be considered:

1. Political parties and leaders should be tolerant, committed, dedicated, and moral if they want to make democracy as the successful institution of governance. As democracy is one of the best and acceptable systems of governance, it should be nurtured properly. For good governance, the state has to make good leadership which can ensure a better today and a brighter tomorrow for the state.
2. The future challenges of democracy and governance are to accumulate the peoples' welfare into the mainstream of state politics as well as to achieve all the techniques of governance, good leadership, values, ethics, and principles of democratic politics. Because of the lack of proper socialization, most of the politicians are not able to achieve moral and ethical values. So, values and ethical practices should be started from family ground. And then it must be nurtured in all educational, social, economic, as well political institutions in state.
3. It is essential to establish a culture of showing respect to all those politicians and leaders who have minimum contributions for state and society. It can also help to run the governance in a democratic way.
4. Every political party needs to practice intraparty democracy and external accountability.
5. In spite of belonging to different ideologies, all political leaders of different parties should be integrated on basic national issues.
6. A certain level of respect, consideration, and cooperation among the ruling parties and opposition parties as well as general people can create an environment of democratic governance.
7. Political leaders need to learn political socialization if they want to meet up with sociopolitical values. Without vigorous socialization and political reforms in the major political parties, it is not possible to reach to democratic goals of governance.
8. Establishing democratic norms and values may be the major guard against the lack of proper institutionalization, lack of transparency and accountability, noncooperation between the government and the opposition parties, as well as all undemocratic activities of political leaders.
9. Every man is not born tolerant but must learn to be tolerant. Tolerance can create consolidated atmosphere among the citizens as well as political parties. World has now entered a new phase of democratic politics where it has to deal with the "values and processes" that are essential for consolidating democracy and governance.
10. For ensuring democracy and governance, civil society can play a vital role. Besides

this, legislature, executive, and judicial branch of a state are the key institutions of governance which can ensure effective parliament, establishment of democracy, and good governance.

However, democracy and establishment of good governance are not a matter of 1-day business. It may take generations and perhaps centuries to build an effective and successful democratic system.

Development; Governance; Interconnect

## Introduction

The concept of governance is concerned directly with the management of the development process, involving both the public and the private sectors. It encompasses the functioning and capability of the public sector, as well as the rules and institutions that create the framework for the conduct of both public and private business, including accountability for economic and financial performance, and regulatory frameworks relating to companies, corporations, and partnerships. It is argued that modern nation states in their early stage and for many years subsequently remained responsible for "governance" only or mainly through formal organs. The apparent appeal of the term "governance" for policy-makers such as those in the World Bank was the term's elasticity in referring to the complexities of political structures within the broader process of administration and management. It was a term that connected the concepts of politics and administration (Uddin 2010). The quality and effectiveness of governance depend mostly on how judiciously the government uses the said instruments to help people achieve the ultimate goal of their progress – justice, equity, and peace (IDPAA PRIA 2001). Without effective governance functions, it is assumed that the benefits of the reforms will not reach to the poor and the funds will not be used effectively (Azmat and Coghill 2005). On the other hand, the concept of development is neither new nor old. Development is a continuously

changing and dynamic concept. Since the beginning of civilization, it has been taking different shapes and dimensions. To be practical, there is a fine line exists between the concept of good governance and development. The efficient application of good governance ultimately results in bringing development in various sectors.

## Understanding of Governance

The concept of "governance" is old as human civilization, and therefore, it means different things to different people. Simply put "governance" means the process of decision are implemented (or not implemented). Actually, governance is the exercise of political, economic, and administrative authority to manage a nation's affairs, and it is the complex mechanisms, processes, relationships, and institutions through which citizens and groups eloquent their interests, exercise their rights and obligations, and mediate their differences (UNDP).

Land-ell-Mills and Serageldin, governance may be taken to denote "how people are ruled how the affairs of a state are administered and regulated; it refers to a nation's system of politics and how this functions in relation to public administration and law" (Khan 1996). World Bank conceptualize governance as the way "...power is exercised through a country's economic, political, and social institutions" (The World Bank's PRSP Handbook 1992). This includes (1) the process by which governments are selected, monitored, and replaced, (2) the capacity of the government to effectively formulate and implement sound policies, and (3) the respect of citizens and the state for the institutions that govern economic and social interactions among them" (Kaufman et al. 1999).

The Asian Development Bank (ADB) expressed that the term "governance" is the "manner in which power is exercised in the management of a countries economic and social resource for development" (ADB 1995). On this meaning, the concept of governance is concerned directly with the management of the development process, involving both the public and the private sectors. It encompasses the functioning and capability of the public sector as well as rules and institutions that create the framework for the conduct of both public and private business, including accountability for economic and financial performance, and regulatory frameworks relating to companies, corporations, and partnerships. In broad terms, then, governance is about the institutional environment in which citizens interact among themselves and with government agencies/officials (IDPAA PRIA 2001).

Governance is the process whereby societies or organizations make important decisions and determine whom they involve and how they render account (Canada Institute of Governance 2002). In fact, governance encompasses every institution and organization in the society, from the family to the state and embraces all methods – good and bad – that societies use to distribute power and manage public resources and problems. The working definition used by the British Council, however, emphasizes that "governance" is a broader notion than government (and for that matter also related concepts like the state, good government, and regime) and goes on to state: Governance involves interaction between the formal institutions and those in civil society. Governance refers to a process whereby elements in society exercise power, authority, and influence and enact policies and decisions regarding public life and social development (The British Council 1991).

Governance refers to "all of processes of governing, whether undertaken by a government, market or network, whether over a family, tribe, formal or informal organization or territory and whether through the laws, norms, power or language" (Bevir 2013). It relates to "the processes of interaction and decision-making among the actors involved in a collective problem that lead to the creation, reinforcement, or reproduction of social norms and institutions" (Hufty 2011).

Governance is said to have three legs: economic, political, and administrative. Economic governance covers decision-making processes that affect a country's economic activities and its relationship with other economies. Political governance includes the formulation of policy, while administrative governance is the system of

policy implementation. As can be seen from this and similar definitions used by international development agencies, governance is an all-encompassing concept. It permeates all sectors, and it makes no distinction between governance, policy-making, and policy implementation (Hyden and Court 2002).

Governance can be more understood by examining the functional dimensions of governance and their institutional arenas:

| Dimension | Institutional arena | Purpose of rules |
|---|---|---|
| Socializing | Civil society | To shape the way citizens raise and become aware of public issues |
| Aggregating | Political society | To shape the way issues are combined into policy by political institutions |
| Executive | Government | To shape the way policies are made by government institutions |
| Managerial | Bureaucracy | To shape the way policies are administered and implemented by public servants |
| Regulatory | Economic society | To shape the way state and market interact to promote development |
| Adjudicatory | Judicial system | To shape the setting for resolution of disputes and conflicts |

Source: Hyden and Court (2002)

Governance can be also termed as the operation of three key actors, namely, state, market, and civil society (Fig. 1).

So therefore, governance refers to the formation and stewardship of the formal and informal rules that regulate the public realm, the arena in which state as well as economic and societal actors interact to make decisions.

## Conceptualization of Development

The concept of development is neither new nor old. It is a continuously changing and dynamic concept. Since the beginning of civilization, it has been taking different shapes and dimensions. It could be defined as the capacity of a state to increase its human resource with the aim of achieving higher outcome of production for the satisfaction of the basic needs of majority of its citizens and empowering them to make demands on the government (Sapru 2002).

Development is called a multidimensional concept. It should not be discussed in terms of economic development alone (John 1996). There are various dimensions along with components of development. The political component of development seems to consist of increasing rationality, secularization, equality, and participation in the political system. In broad sense, development is a complex phenomenon comprising many dimensions such as political, economic, social, administrative, and cultural (John 1996). Amartya Sen argues development should include a broad range of freedoms or rights such as the basic capabilities to avoid starvation, undernourishment, or premature mortality, as well as rights to education and being able to engage in participation in the political process. This argument is also reflected in the discussion in the 2000 Human Development

**Governance and Development, Fig. 1** Three key actors of governance (Source: http://www.slideshare.net/nayanarenu/good-governance-6268274)

Report of the relationship between human rights and human development approaches.

Development is a process which enables human beings to realize their potential, build self-confidence, and lead lives of dignity and fulfillment. It is a process which frees people from fear of want and exploitation. It is a movement away from political, economic, or social oppression. Through development, political independence acquires true significance. And it is a process of growth, a movement essentially springing from within the society that is developing (The Challenge to the South: Report of the South Commission 1990).The Brandt Commission report stated that, "Development never will be, and never can be, defined to universal satisfaction" (The Brandt Commission Report 2001).

In addition define the concept of development in different way. Weidner defines development as a process of growth in the direction of modernity and particularly in the direction of nation-building and socioeconomic progress. A famous scholar named Michael Todaro defines development as a multidimensional process involving changes in structures, attitudes, and institutions as well as the acceleration of economic growth, the reduction of inequality, and the eradication of absolute poverty.

In brief, development is a process of improving the well-being of the people. It is about raising the standard of living of the people, improving their education and health, and also opening out to them new and equal opportunities for a richer and more varied life. Better health – a longer life with less sickness – is crucial to a better standard of living.

## Relationship Between Governance and Development

### Needs and Rights Approach to Development

A rights-based approach to governance and development has many advantages. First of all, it shifts the focus from government to citizen. Good governance is a public good that citizens should be entitled to. Secondly, by focusing on entitlements, it recognizes that poverty is not just a matter of being economically deprived. It is defined and sustained by a sense on the part of the poor of helplessness, dependence, lack of opportunities, and lack of self-confidence and self-respect. The language of rights makes clear that the poor are not the subject of charity and benevolence by governments or the rich but that they are entitled to a decent standard of living and that rights are the vehicles for their participation and empowerment. The third thing about a rights-based approach is that it draws attention to the importance of norms and rules. How a society is governed and how it achieves its development is as important in this perspective as what these processes accomplish. That is why this study is justifiably focusing on rules, not just results. The quantitative indicators of development – social or economic – should be analyzed in terms of how they were achieved. Regimes, and how they are governed, are important in this context. What scope do they leave for citizens to enjoy their rights? It is how these rules, aggregated into a particular political regime, are perceived that gives us the clues to how good governance is (Hyden and Court 2002).

Guiding the analysis of governance is a series of basic principles that reflect the emerging consensus at the global level of what should, and could, constitute "good governance":

- *Participation*: the degree of involvement and ownership of affected stakeholders
- *Decency*: the degree to which the formation and stewardship of rules are undertaken without humiliation or harm of the people
- *Fairness*: the degree to which rules apply equally to everyone in society regardless of status
- *Accountability*: the degree to which public officials, elected as well as appointed, are responsible for their actions and responsive to public demands
- *Transparency*: the degree to which decisions made by public officials are clear and open to scrutiny by citizens or their representatives
- *Efficiency*: the degree to which rules facilitate speedy and timely decision-making

### Provision of Infrastructure Development

Governance and development are interrelated and interdependent. Overall development of a country depends on effective governance. By this process, a country achieved their ultimate social and economic goals. If government takes proper initiatives to both social and economic sector, the development of countries will be ensured. So, they have inner relationship, for example, infrastructural development of Bangladesh, construction of Padma Bridge, roads and highway, culvert, hospital, school, college and university, etc.

### E-Governance and Development

E-governance is recently common phenomenon all around the world. The Government of Bangladesh is committed to establish Digital Bangladesh within 2021 which is called "vision 2021." For example, Access to Information (A2I) is the project of the Government of Bangladesh which is maintained by the Prime Minister Office. They take various projects to develop IT sector. E-service center is now available for their firm attempts.

- District E-service Centre
- Upazila E-service Centre
- Union E-service Centre or Union Digital Center

### Level of Correlation with Development Outputs

There is a linkage between development institutional features of government that are designed to perform governance effectively and efficiently. The important thing for us is to demonstrate how an elite survey of governance perceptions in transitional societies now and 5 years ago correlates with objective development indicators contained in the World Development Report and the Human Development Report. If governance is important, assumed in international development circles, one would expect that wherever governance scores are high, rules enjoy legitimacy and should translate into outputs that indicate the effectiveness of the political process in serving economy and society. The analysis would also examine which dimension of governance may show the highest level of correlation with development outputs (Hyden and Court 2002).

### Governance as a Means to Enhance Human Development

The definition of governance has centered on what makes institutions and rules more effective and efficient in order to achieve equity, transparency, participation, responsiveness, accountability, and the rule of law. These aspects are crucial for human development and the eradication of poverty since ineffective institutions usually result in the greatest harm to those who are poor and vulnerable. Whatever form the framework takes, it must both be premised on and support governance for peaceful, inclusive, and responsive human development. In particular, it should lead member states and development actors to:

- Focus on strengthening institutions and human resource capacities at all levels, concentrating on parliaments, electoral bodies and related processes, the security and justice sectors, public services, and promoting coherence across institutions
- Support a state-society compact and culture grounded in constitutionalism, access to justice, equality, and human rights
- Assist public institutions to become more effective, responsive, accountable, and representative through e-government and other means, foster public sector capacities and public-private partnerships at national and subnational levels, prevent corruption, and promote the transparent and sustainable management of public goods and financial and natural resources
- Support capacity for cross-sectoral, integrated, and inclusive decision-, policy- and law-making, at all levels
- Ensure the strengthening of citizen participation and civil society organizations' engagement, including through e-participation, to ensure accountability and transparency and better inform decision-making
- Support transparency and the right to access information about public affairs, encouraging states to adopt and implement legislation

ensuring broad access to information by the public, including through the use of mobile, social media, and other appropriate technologies
- Strengthen the environment for an independent and pluralistic media and ensure that the media serve the needs of society by reflecting a diversity of political views, cultures, languages, and beliefs (UN Development Agenda 2015)

### Linkage Between Governance and Development

Fair and effective governance is critical to ensuring that development benefits both people and the planet. Governance should entail processes, decisions, and outcomes that sustain natural resources alleviate poverty and improve the quality of life. A governance lens offers a powerful impetus for promoting reforms in policies and programs for sustainable development. These include open and transparent opportunities for poor and disadvantaged citizens to access information and secure their rights over land, forest, and energy resources and to encourage governments to adopt policies that are more friendly to people and the environment. The massive injection of public funding for mitigation and adaptation and the complex political processes that underpin climate change negotiations can benefit from governance perspectives to shed light on the power, interests, and resources at stake in order to bring about better outcomes (Weber 2015).

### Institutional Arrangements of Governance Performing in Development Sectors

Institutions of governance include public administration and public services connected, in particular, with the sound management of resources, delivery of and equitable access to public services, responsiveness to the views of citizens, and their participation in decisions that concern them. Strategies adopted in response – including better personnel management, transparency in public finance, a curb on corruption, citizen participation, and enhanced accountability – have since become common currency in public administration dialogue. In addition, performance norms have been the subject of debate in the fields of education, health, finance, and other development sectors (UN Development Agenda 2015).

### To Maintain Efficient Market as a Component of Economic Development

Government capabilities for delivering effective governance were now argued to be essential for maintaining efficient markets and restricting the activities of states to the provision of necessary public goods so as to minimize rent seeking and government failure. The importance of markets in fostering and enabling economic development is not in question. Economic development is likely to be more rapid if markets mediating resource allocation in any country become more efficient. The policy debate is rather about:

- The extent to which markets can be made efficient in developing countries
- Whether maximizing the efficiency of markets (and certainly maximizing their efficiency to the degree that is achievable in developing countries) is sufficient to maximize the pace of development

For example, the successful East Asian developers of the last five decades, where strong governance capacities existed, were typically very different from the governance capacities necessary for ensuring efficient markets (Khan 2010).

### Provide a Means of Early Development through Growth-Enhancing Governance

Growth-enhancing governance capabilities are capabilities that allow developing countries to cope with the property right instability of early development, manage technological catching up, and maintain political stability in a context of endemic and structural reliance on patron-client politics (Khan 2010). Effective growth-enhancing governance capabilities can create the preconditions for achieving greater economic efficiency over time.

### Growth-Enhancing Governance and Economic Growth

There are some structural features of developing countries that require very different governance

capabilities if developing countries are to make successful and sustainable transformations into higher productivity economies.

- The first governance capability is required to manage the structurally weak property rights that characterize developing countries.
- Secondly, emerging capitalists in developing countries face a structural problem with acquiring the tacit knowledge and learning that is essential for achieving international competitiveness.
- Thirdly, developing countries suffer from structural political corruption due to the difficulty of managing political stabilization using fiscal processes.

Success in economic transformation has rather required governance capabilities in managing patron-client politics in ways that allow political stability sufficient for capitalist accumulation to continue (Khan 2010). The growth-enhancing governance is a result of the capabilities of governance which result in economic growth that is a fundamental element of development.

## Governance and Participatory Development

The goal of economic and social development in developing countries is to set in motion a process of self-reliant and sustainable development through which social justice will be realized. "Self-reliant development" means building the endogenous mechanisms of society that will enable developing nations ultimately to achieve growth without aid. Participatory development as a form of development heightens sustainability and self-reliance and aims for the realization of social justice by improving the quality of people's participation. Governance as an ideal orientation of the state does not have a direct cause-and-effect relationship with participatory development, but the government should assume the role of a provider of a proper environment for market economy, extensive promoter of people's capabilities, builder of efficient administrative structures, and reflector of the popular will (JICA 1995).

## Policy Links to Governance Approach Resulting to Development

Contemporary governance and economic policy reform strategies are derived from different links. An important theoretical development was the idea that pro-poor service delivery was a way not only of directly attacking poverty but also of empowering the majority and creating expectations that would drive a popular demand for greater accountability (Fig. 2).

The importance of the governance perspective in informing contemporary development policy and discourse cannot be overemphasized. A powerful way of evaluating the appropriateness of the relationships between growth and

**Governance and Development, Fig. 2** Policy links to good governance approach. (Source: http://www.grips.ac.jp/forum/DCDA/Chapter05.pdf)

governance asserted in the governance agenda is to look more carefully at some of the data and evidence that is used by proponents of the agenda to support the program (Khan 2010).

### Governance and the Management of Political Stability Contributing to Development

The governance challenge is to understand how, in specific contexts, the management of political stability is being achieved using the historical endowments of institutions and power structures and whether feasible changes in political institutions and political organizations can assist in strengthening political stabilization. Here too, the priorities of market-enhancing governance may be misplaced. What we need is a much better understanding of the types of patron-client networks through which political stabilization and political accumulation take place in different countries, so that governance interventions can be designed to improve sustainable growth and development outcomes (Khan 2010).

## Conclusion

Governance relates to the processes of interaction and decision-making among the actors involved in a collective problem that lead to the creation, reinforcement, or reproduction of social norms and institutions. Development is the process in which someone or something grows or changes and becomes more advanced. The view of development is purely an adjustment of the initial view of the concept that is governance. Governance provides an alternative to democratization which is a precondition for development. It has a direct link with the development outputs. Governance can also be used as a means to enhance human development and to promote sustainable development. An important component of economic development is efficient market which can be ensured by effective governance functionaries. It is also related to participatory development and policy measures liked with development. Governance can bring political stability and serve as an enduring area in development studies. So, the two terms governance and development are intimately related to each other.

# Governance and Good Government in Latin America

Manuel Villoria
Rey Juan Carlos University, Madrid, Spain

## Synonyms

Integrity and anti-corruption policies in Latin America and the Caribbean

## Definition

A good government is one that generates a set of formal and informal rules that, being legitimate, equitable, efficient, stable, and flexible, constrain inefficient, inequitable, arbitrary, corrupt, and illegal behaviors among its leaders and employees, and that incentivize the contrary, efficiency, impartiality, accountability, transparency and integrity.

## Introduction

Most of the Latin American and Caribbean (LAC) governments have deficiencies in its regulatory framework, organizational structure, personnel system, and technical competence. They have also problems in planning, financing, and implementing administrative reforms. Although these problems are not generalizable to all LAC countries, where they appear are a consequence of institutional limitations. And these institutional limitations have their roots in the abuse of power, entrenched impunity, and corruption of political and economic elites. As a consequence, fighting corruption and strengthening the institutional framework, especially fostering impartiality, integrity, accountability, and transparency, is the best way to have a more responsive, professional, and efficient public administration and a good government.

This article will attempt to answer the question: what has been done to prevent corruption and promote a "good government" in LAC, what are the results and what explains the current situation? Concerning methodology, the meta-evaluation required a review and validation of findings and data from existing evaluations. This led us to a comprehensive desk review of other previous articles and reports; we conducted five focus groups with around 40 political appointees from 8 LAC countries. Sometimes we did in-country project consultations with civil servants on the ground, thanks to different academic courses and invitations from universities and Institutes of Public Administration; finally, we included triangulation of the available data and information.

## Theoretical Framework

According to different studies, the crisis of the 1980s and part of the 1990s in LAC was due to the overdevelopment of the state and the infinite and fragmented social expectations of society. This theory led to the implementation of reforms based on the Washington Consensus: deficit control, public debt reduction, privatization, reduction of public spending, etc. But the limits that this strategy imposed for sustainable development, the quality of the democracy, and the rule of law led to a reassessment of state institutions in the mid-1990s. The essential solution to ensuring economic development is not to eliminate the state, but to generate good institutions that guarantee property rights and legal certainty and check excessive government power (World Bank 1997). (Institutions according to Elinor Ostrom are, "prescriptions that human beings use to organize all kinds of repetitive and structured interactions" (2005, p. 3). According to North, they would be, "the rules of the game in a society; formed by formal (laws, constitutions) and informal (behavioral norms, conventions) restrictions, and the characteristics of their implementation and enforcement. Taken as a whole, they constitute the incentive structure of societies (1990, p. 3). The acceptance of appropriate institutions as engines of growth and welfare has become commonplace. This is what the World Bank currently describes with the concept of **good governance** and measures by the global indexes of good governance. The World Bank Institute (Kaufmann et al. 2006) defines it as the sum of: "...institutions and traditions for which the power to govern is executed for the common good of people" (Kaufmann et al. 2003, p. 2). In other words, it would be those formal and informal institutions that incentivize the government and society to act cooperatively and efficiently and discourage extractive behaviors from leaders. It includes voice and accountability, stability and absence of violence, governmental effectiveness and regulatory capacity, rule of law, and control of corruption.

From the concept of good governance, we can now derive the concept of **good government**

G

*stricto* sensu. A good government is one that generates a set of **formal and informal rules** that, being legitimate, equitable, efficient, stable, and flexible (Alonso and Garcimartín 2011; North 2005), constrain inefficient, inequitable, arbitrary, corrupt, and illegal behaviors among its leaders and employees and that incentivize the contrary, efficiency, impartiality, accountability, transparency, and integrity. This set of rules needs coherent processes for application. Further, they need organizations that are not only rational actors but also moral actors that assume the values and goals – logic of appropriateness – that justify them and ensure the respect and impartial application of the assigned rules and processes (Selznick 1992; March and Olsen 1984, 1989).

## Analysis and Results

In order to achieve the diagnosis of the situation, we will follow this order: first we will analyze the transparency policies and next the accountability and the integrity policies developed in the last years in the LAC region, and we will conclude trying to see the impact of these efforts.

### Transparency

According to the approach of professors Bauhr and Grimes, there are three components that are considered essential elements of transparency policies: (1) open government data and the right of citizens to access government data, (2) protection for corruption and fraud whistle-blowers, and (3) publicity (2012). The first component is expressed through laws that require the government to actively publish its data and which recognize citizens' right to access it. However, the existence of these laws, in and of itself, does not guarantee transparency by any means. It could bring us closer to a nominal sort of transparency, but not one that is effective, which requires far more (Heald 2006, p. 34). In January 2017, at least 110 countries in the world had established the right of freedom of information. In Latin America, there were 17. Although progress in the generation of standards and transparency bodies has been very high (see Table 1) (http://www.rti-rating.org/country-data/), the implementation and institutionalization of transparency and access to public information policies have been uneven in Latin America. In a first category are Mexico, El Salvador, Uruguay, and Chile, countries that have had the best results – although not optimal – considering that they have systems that work fairly well; that they have strong regulatory bodies; and that they have had, sometimes, controversial situations and the system has managed to overcome them. The opposite case is represented by Cuba, Haiti, Bolivia, and Venezuela, which are right now the only four countries that do not yet have an access to information law.

Concerning the systems of whistle-blowing protection, most of the LAC countries does not have a formal system in place to protect whistle-blowers, and where it is formally established, the implementation is weak and poorly financed. Finally, talking of publicity, according to Freedom House, journalists in the Americas faced an increase in violence, lawsuits, and police interference in recent years. Brazil, Colombia, Honduras, and Mexico remain among the world's most dangerous places for journalists. The percentage of those enjoying a free media in 2016 remained at its lowest level since 1996, when Freedom House began incorporating population data into the findings of the report. Considering all these data together probably only Chile, Costa Rica (although its FOIA is very recent) and Uruguay enjoy an acceptable level of transparency.

### Accountability

Concerning accountability, there are two distinguishing dimensions to evaluate: (1) the obligation of public officials to inform about their decisions and publicly justify them and (2) the ability to impose sanctions on public officials who have violated their duties or breached their obligations. This dimension of sanction is considered a crucial aspect of the very idea of accountability: there cannot be accountability if the principle that demands action does not have the institutional capacity to apply sanctions to

Source: World Bank: Worldwide Governance Indicators series

[a]Voice and accountability captures perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media. The standard normal units of the governance indicator ranges from around −2.5 to 2.5

those agents engaged in illegal or nonethical behavior. According to the "Voice & Accountability" Index of WB (see Table 2), the situation is not very positive in general.

Speaking of control and sanctions, it is necessary to highlight the role played by the Supreme Audit Institutions (SAIs) in the rendering of accounts. Of the 22 countries of the region that

have this type of organization, 27% of them are collegiate bodies, and 73% are a sole authority; 22% are Courts of Accounts, 14% of Audit, and 64% are Comptroller General Agencies. In general, these bodies are very bureaucratic and lack enough budget and competences to do a very effective job.

But today, transparency, accountability, and participation can go hand in hand, thanks to the new technologies. It's what we call open government. Open government includes instruments, processes, and bodies that contribute to transparency, accountability, collaboration, and citizen participation, thanks to the intelligent use of new technologies. In the LAC region almost 75% of the countries have developed a digital strategy, although only 60% of them reported using performance indicators to monitor progress in the implementation of e-government. Sixty-one percent of the LAC countries have developed online portals. Moreover, the XVII Ibero-American Conference of Ministers of Public Administration and State Reform approved in July 2016 in Bogotá, Colombia, the Ibero-American Open Government Charter. According to a recent survey carried out by the OECD, 62% of the LAC countries have adopted a wide-ranging strategy in OG that in many cases refers to the action plans presented in the framework of the Open Government Partnership (i.e., Paraguay, Mexico, Chile, Costa Rica).

## Integrity

We will now move on to a broad study of the measures adopted by Latin American governments to strengthen integrity. In the words of the OECD, "public integrity refers to the constant alignment and appropriation of ethical values, shared principles and norms, to protect and prioritize the public interest over private interests in the public sector" (OECD 2016, p. 7). In global terms, the most relevant document defining integrity for the Latin American region is the Ibero-American Code of Good Government (*Código Iberoamericano de Buen Gobierno*), which hopes that "governmental action consists of the practice of promoting the general interest, and departs from the reprehensible abuse of public resources for private or partisan interests." (CLAD 2006, p. 1). The code is aimed at senior politicians and political appointees. It includes a detailed set of principles, values, and norms that promote the impartiality, effectiveness, legitimacy, and integrity of government. Unfortunately, it does not have instruments for ensuring compliance. The assessment of its implementation provides dismal reading, albeit it has fulfilled its role as driver of a discussion and as generator of other codes.

Although unethical actions go beyond the corrupt and fraudulent ones, it is necessary to prevent and fight corruption to build integrity in the public sector. Concerning corruption there have been significant advances in Latin American cooperation in preventing and fighting it, for example, (a) *Convención Interamericana Contra la Corrupción* [Inter-American Convention Against Corruption, by the Organization of American States] (Caracas 1996), (b) *Foro Iberoamericano de Combate a la Corrupción* [Ibero-American Forum for Combating Corruption, CLAD] (Santa Cruz de la Sierra, Bolivia, June 1998), and (c) *Convención Anticorrupción de la ONU* [United Nations Anti-Corruption Convention] (October, 2003) (One result of this fórum was the creation of the Red de Instituciones de Combate a la Corrupción y Rescate de la Ética Pública (RICOREP) that coordinates CLAD). Also, the conventions have mechanisms of periodic evaluation of implementation through demanding peer reviews. Now the priority is to guarantee the implementation of the conventions and the effective development in all areas of intervention. This takes us once again to the problems of effective implementation of agreements.

Concerning the integrity frameworks, the Colombian government, led by the Secretary of Public Function, and following OECD recommendations, made the decision to review and restructure the Institutional Integrity Policy of public entities as a strategy to take on the challenges presented by the institutional and political situation (Función Pública de Colombia 2018). Peru has approved in May 2017 an integrity plan that in the implementation chapter reproduces the OECD model too. Last but not least, in the last

18 years, Chile has adapted its regulations regarding integrity through a robust legislation that protects the impartiality, transparency, and values of the public sector. The distrust in public institutions, despite the low levels of corruption in the country, was considered a relevant problem that should be overcome, and, therefore, based on the proposals submitted by the Presidential Advisory Council against Conflicts of Interest, Traffic of Influences and Corruption, the Former President of the Republic, Michelle Bachelet, presented an Agenda on Probity and Transparency in Business and Politics. This Agenda incorporated 18 legislative and 14 administrative measures, and among them it was established the public services obligation to draft a code of ethics (https://www.serviciocivil.cl/codigos-de-etica/).

The development of appropriate **codes of conduct** for officials is an increasingly common trend in LAC. The Chilean model is characterized by the generation of ethical codes by organization without a general code defining the system. However, the current Colombian model is based on generating a general code and, subsequently, allowing adaptations. In Mexico there is also a basic general code of ethics, with a very detailed system of instructions, and, subsequently, a Committee on Ethics and Prevention of Conflicts of Interest is required in each organization; the Committee must prepare a code of conduct for the members of the corresponding organization. Panama, Brazil, and El Salvador already have implemented a generic code and, also, specific codes in specific units or for certain professions within the public service.

## Impacts

Tackling corruption is part of one of the objectives of the United Nations' Sustainable Development Goals (SDGs) – an ambitious set of 17 global goals – UN calls on governments to "substantially reduce corruption and bribery in all their forms" (Goal 16.5). Latin American countries are strongly concerned with this problem. According to Transparency International (https://www.transparency.org/news/feature/perceptions_remain_unchanged_despite_progress_in_the_americas), "in the last few years, Latin America and the Caribbean made great strides in the fight against corruption. Laws and mechanisms exist to curb corruption, while legal investigations are advancing and citizen anti-corruption movements are growing in many countries across the region. However, according to the Corruption Perceptions Index (CPI) 2017, the region continues to score poorly for corruption. While progress has been made to combat corruption in several countries, there are still no overarching policies in place to address the historic and structural causes of corruption throughout the region." In most of the countries, the scores have worsened in the last years, and where there are improvements, they are still slight (see Table 3).

Considering the results of the victimization indexes, the situation is not better. According to the Global Corruption Barometer 2017, from Transparency International, those who had had contact with six key public services in the last 12 months were asked whether they had paid a bribe, given a gift, or done a favor to the public official in order to get access to the services that they needed. TI found that just under a third of citizens who had come into contact with a public service in the previous 12 months had paid a bribe (29%) (TI, 2017, 16). Seven years before, in 2010, the average respondent that stated having to pay a bribe in the last 12 months in Latin America was 23%, the six points increase is worrisome. These results, linked to the multiple scandals that came to light in the last years, have created a pessimistic view of the job the government is doing fighting corruption. The Global Corruption Barometer survey of 2017 asked people whether they thought the level of corruption in their country had increased, decreased, or stayed the same in the 12 months prior to when the survey was conducted. More than six in ten people living in Latin America and the Caribbean thought that the level of corruption had increased (62%). Moreover, Transparency International asked people to tell them how well or badly they thought their government was doing in fighting public sector corruption. They found that just over a half of citizens in the region said "that their government was doing badly (53 per cent) while just over a third said that their government was doing

[a]Data sources are standardized to a scale of 0–100 where a 0 equals the highest level of perceived corruption and 100 equals the lowest level of perceived corruption

well (35 per cent). High levels of disapproval were found in Chile, Paraguay and Peru where over two thirds of citizens in these countries gave their government a poor rating" (TI, 2017, p. 12).

The persistence of the aforementioned institutional problems seems to correlate with the confidence in the institutions and with the support for democracy expressed by the respondents in Latinobarómetro (2016 and 2017) (www.latinobarometro.org/). Confidence in the institutions, particularly in the political and governmental institutions, registered a decrease since the measurement of 2015. It should be noted the fall in citizen confidence on the electoral institutional framework, which, in 2 years, passed from 44% to 29% (people saying they have a lot or some confidence); confidence in the government dropped from 33% to 25%, the confidence in the judicial power decreased from 30% to 25%, the public trust in Parliament dropped from 27% to 22%, and confidence in political parties went from 20% to 15%, this being the institution that generates less confidence among citizens.

## Conclusion

The most important factor explaining the failures of design and implementation of institutional reforms in LAC is the presence of a social and political trap. The social trap is expressed by the incoherence of society itself which on the one hand demands honesty from government but in practice incentivizes corruption by paying bribes, breaching rules, demanding privileges within the framework of clientelist networks, etc. According to the collective action theory, corruption is self-reinforcing in nature, as explained by Persson et al. (2012), and when corruption is highly perceived, it creates a larger problem than when it is not perceived because the high perception of corruption may create "a second-order collective action dilemma," (Ostrom 1998, p. 7) wherein rational actors are highly dependent on shared expectations about how other individuals will act. Thus, as long as a large enough number of actors are expected to engage in corruption, everyone has something to gain personally from engaging in corruption, and there is little possibility of being caught and punished (Morris and Klesner 2010; Bardhan 1997). Failures to contain corruption and over-perception of its existence may, thus, have wider societal consequences, affecting institutional and social trust and acceptance of rule

breaking in those societies (Villoria et al. 2013). Those societies will face a "social trap" that will preclude them from building the necessary social consensus to adopt public policies that would nurture a generalized social solidarity and trust (beyond private groups).

Finally, there is a political trap, because to improve the economic development and the social welfare, governments have to cede power and privileges to an honest, professional, and accountable administration, and to do that they have to face opposition from its own clientele when crushing the expectation that this may have created hoping to enjoy the spoils of power. Nevertheless, LAC has examples of countries and institutions that have succeeded in the process of building good governance and good administration. It is necessary to learn from them.

Governance and Government

## Definition

Governance is the process of governing and ruling or the act of governing. It is different from government in the sense that government, refers to a

structured system to govern a region, state, or country. It could also be defined as a body which formulates laws and has a legal right to enforce it within a given territory.

## Introduction

In common parlance, governance and government are treated as synonyms by many, but in recent decades, studies have established that these concepts are disparate, both theoretically and empirically. In theoretical terms, governance is the process of governing. It is what government does to their citizens. But it is also what corporations and other organizations do to their employees and members. Whereas government refers to political institutions, governance refers to processes of rule wherever they occur (Bevir 2012, 3). Chhotray and Stoker write: "governance is about the rules of collective decision-making in settings where there are plurality of actors or organizations and where no formal control system can dictate the terms of the relationship between these actors and organizations" (Chhotray and Stoker 2009, 3). Governance is more than government; it consists of the combined efforts of all sectors in the "steering" of society. Governance "describes the processes and institutions through which social action occurs, which might or might not be governmental" (Kettl 2002, 119). Governance is a generic term to describe decision-making in organizations such as corporations and universities, while government implies rule and control of political institutions over its citizens. It is different from government and is a new process of governing based on market and civil society along with the state.

In social science research, defining a concept before taking it up for study is very important since every term has its own definitive connotation. Hence, delineation of the meaning of both the concepts is pertinent, although a precise definition of both is arduous. Various scholars have given their own definitions depending on their disciplinary locations and have argued that contemporary governance needs to be understood from a novel perspective. Various authors suggest that apart from state, market and society also have a stake in the process of governance. The process of governance is getting more into networks and interdependence (Rhodes 1997; Bevir 2012; Pierre 2000).

This entry provides a concise view of the transpose of government to governance. It begins with the theoretical perspectives which provide the internal logic of the aforesaid shift. The ensuing section then discusses the debate of the feasibility of governance and the diminishing role of the state. The article concludes that the new model of governance lacks certain structural preconditions which have resulted in serious democratic pitfalls which deserve attention and discourse as well.

## Perspectives

Society does not comprise of social beings and entities alone. Lievens demonstrates an idea by quoting French political theorist Claude Lefort who argues that it is imperative to have an order of representations through which the society gains a meaning in order to understand themselves as individuals or as social groups and relate to each other. It is this pursuit of symbolic and imaginary representation of society from a panorama view that an entity or a position external to the society is signified. And it is in that entity where power is vested, which serves the role of both steering and social regulation of society (Lievens 2015).

But to have a perceptible idea on government and governance, in this context, the concept of "government" can be placed which in common parlance includes the following characteristics: exercise of power in a state context, sovereignty, territoriality, and citizenship that is hierarchical control of the state exerting sovereign control over its citizens. Accordingly, government is the office or authority of governing, and "governance" is the act of governing with the leadership and management of the government. In most dictionaries, government and governance are treated as synonyms and in recent decades, the term "governance" has been taking different

dimensions where government has come to mean governance.

Mark Bevir outlines the broad characteristics of governance. He defines that firstly, it combines the administrative arrangements with features of market mechanism and nonprofit organizations. Secondly, it has a multi-jurisdictional or transnational character. Governance combines people and institutions across different policy sectors and different levels of government like local-regional, national, and international. For example, in controlling food policy and quality, different levels of government bodies are needed to be involved. Thirdly, governance has developed the characteristic of increasing range of stakeholders from different sectors like third-party organization to deliver state services. Governing has become increasingly hybrid multi-jurisdictional and plural phenomenon (Bevir 2012, 5–7).

Lefort's theory gives an interesting backdrop to understand the symbolic transition of society from government to governance through the linear comparative analysis of three forms of society: pre-modern societies, democratic societies, and society of governance. Pre-modern societies had rulers who incorporated knowledge, power, and law. Gradual differentiation between social spheres (economy, culture, politics), especially politics, led to the emergence of the democratic societies. And it is in this political sphere where the meaning of society is created. The parliament, the public sphere, and the voting process along with the other elements structuring society including principles of equality, freedom, and solidarity, become visible and an image of the society is engendered. This divides the society into various groups (holding knowledge on law, politics) horizontally and between the society and the government vertically. Now there occurs an alteration within the society in regard to the way it deals with transcendence. Lefort maintains that in pre-modern societies, the image of the society was manifested in a place external to the society, and hence its transcendence was very strong. In democratic societies that imaginary place came to be located within the society yet continuing to be superior which is termed as "immanent transcendence" (Lefort quoted in Lievens 2015, 5–10).

Governance moves one step further and dismisses the remaining form of transcendence such as sovereignty, the nation, or the people. Here the ideological and political constructs like citizenship, sovereignty, and nation become increasingly symbolic fictions that are not "real" in relation to the social reality characterized by social inequality, hierarchies, and divisions. This growing disenchantment between social reality and symbolic fictions gives way to the dissolution of the state or government (Lievens 2015, 5–10).

The replacement of the concept of government with governance that seems to be immanent in society, seems to encompass both the political and the social sphere and blurs the distinction between the private and the public. It results in the withering away of the concept of nation-state and the establishment of the networks of public actors or public authority. The process of substantial subsumption of government under governance needs to be assessed from a different angle and not just a linear analysis of a society progressing from pre-modern societies, democratic society, and finally the society of governance as theorized by Lefort. Here it is precursory to understand the internal logic of this accidental slippage of government to governance (Bonnafous-Boucher 2005, 522–523).

Governance consists of the state which has the sole responsibility of assisting the markets and the communities; civil society consisting of the citizens, NGOs, and the groups outside the government but within the public arena (representing and articulating the voices of the excluded); and the market creating wealth for distribution. It implies leadership toward societal development rather than mere control orchestrated on the citizens by the act of government. The concept of governance provided the government to search for new rules and processes between networks of public actors, instead of focusing on an entity having the sole responsibility of governance. This was termed as the "governmental rationality of liberalism" by Foucault. This is the turning point of political philosophy as well. The classical political

philosophy of state, sovereignty, and relation between the governors and the governed is shed, and a theory of domination sets in. Governmental rationality or "reason of state" began to characterize sovereign authority, independent, administrative apparatus, and most notably an entity upholding power and stability, unlike liberal governmental rationality (Bonnafous-Boucher 2005, 521–529).

This leads to an outgrowth of governmental practice that outcries "do not govern too much." The management of the public affairs need not be seen as the exclusive domain of the government. The affairs of the government are problems of all, and hence the various segments of society are involved in steering the society (Carino 2017). This approach facilitates the permeability between the government of public affairs and the private affairs of the market which unleashes legitimated forms of political and economic subjectivation and also modes of action that affect the actions of the individuals. Foucauldian perspective, thus, provides us with an internal logic of the transformation of the nature of state from democratic ideals to ideals-based decentralization of power, i.e., on networks of actors and civil society (Bonnafous-Boucher 2005, 525–527).

## Seamless Cooperation or Conflict

Social scientists have observed a shift in the model of governance since the 1970s. There has been a shift from a hierarchical, sovereign control of the state over its citizens to a model where non-state actors and market participate in the formulation and implementation of public policy. Old governance is state-centric, whereas new governance is society-centric. This transpose has also generated two contending groups as well. Some scholars argue that the state and the society influence each other. From this perspective they support the participation of society in governance, where community and the people influence the government and participate in policy making. They believe in an approach that includes various non-state actors and the market in steering the society in contrast to the traditional model of governance that dealt primarily with the government in formulating and implementing public policy. This shift saw the state looking up to the market for political steering, and market principles became the political ideology which ultimately led to the introduction of neoliberal policies (Carino 2017; Mayntz 2006).

But it is not always practically viable. The cooperation between the state and civil society has been taking many forms and dimensions. This entry argues that the constituents of modern governance (market, civil society) could not fulfill the basic preconditional and structural necessities on which the aforesaid model rests. They have failed to represent different functional and socio-economic interests of the society mainly because of the absence of societal self-regulating system. This system means that the private organizations need to fulfill regulatory functions that are ultimately in the interest of the public. Hence these actors who represent the public in decision-making process tend to dominate the marginalized. Here, the role of the state within governance is lacking. The state has failed to perform its structural role of providing strong self-regulation, so that the public interests gain precedence over private interests. Therefore, it is difficult to say that the shift from government to governance has been beneficial. Of all the debate on this topic, much discontentment and apprehension has been vented out toward the shift for governance. However, it is too early to consider this makeshift in defeatist lines specifically, since it also allows the market and the civil society to make its own decisive contributions.

But here, it is also pertinent to comprehend why the unleashing of the upper hand of the markets or rather laissez faire policy has exacerbated social equalities, and the state is reduced to terms synonymous to "class state" or "state for class." To understand this chaos, we can fall back on Foucault's concept of governmentality. He maintains that governmental rationality prescribes a form of law in order to limit the unlimited objectives or "excessive governance" that the state aspires to, for its, self-preservation. Hence

the law takes the form of a structure of mediation between law and morality. On the other hand, the rationality of liberal government derives from the production of rule itself and sets its objectives based on various actions, agendas, and non-agendas that come up in the civil society, and hence their self-limitation is not definitive. But this absence of self-limiting rule is also slowly understood as a double-edged sword. Liberal rationality confirms the emergence of political economy. The adjunct of economic rationality to political rationality thus comes to characterize contemporary governmental rationality. And their policies and actions are designed in terms of effects rather than in terms of original rights. "Governmental practices are not examined from a legal point of view in order to determine whether or not they are legitimate," but are judged by their results and effects. This break in the structure of mediation between law and morality and the consequent social tensions and inequalities that followed have put "governance" on defeatist lines, more so because it has caused some serious democratic pitfalls (Lievens 2015, 5–10).

## Is the State an Autonomous Actor in This Paradigm Shift?

In recent times the nature of governance has changed. Due to transnational transaction of cultural, political, and economic affairs, a new form of governance has emerged, which social scientists think might weaken the state capacity to govern. In this context, Jessop argues, "there is a general trend towards the denationalization of the state (or, better, statehood). This structural trend is reflected empirically in the 'hollowing out' of the national state apparatus with old and new state capacities being reorganized territorially and functionally on sub-national, national, supranational and trans-local levels" (Jessop 1997, 573). But this trend was not intrinsic to the concept of "governance" because the state would never cease to be omnipotent. The political sphere needs to sustain democratic essence so that it would democratically legitimate the elected representatives so that they reflect the interests of the socioeconomic, ethnic, and religious groups in the society and not in the interests of the major dominant groups.

Jessop outlines that "state power has become less important in key respects in contemporary capitalism – as governance has become more important however, countering this trend is the survival of the national state as the principal factor of social cohesion in societies and its associated role in promoting social redistribution" (Jessop 1997, 573–574). Khan marks that international agencies have failed to recognize the basic problem of corruption and governance in developing countries. They have overlooked the construction of capitalism, which is inherently divisive. It often rewards and deprives individuals in arbitrary ways. Ignoring this issue, it is not possible to understand the roots of political instability, political corruption, and the extant political clientelism (Khan 2002). These developments and processes have raised the debate whether the state is an autonomous actor. This slippage of the entity government within governance has led to the domination of the marginalized people by the dominant private actors.

Assuming that the state has lost its autonomy is not legit because the state has been taking a different character by controlling its subjects through technology and withdrawing from public provisions. More developed information technology, use of mobile phones and Internet might put surveillance on people. Subjects surrender themselves to the scrutiny of the state. The more civilized one becomes, the more is the surrender to the modern state. Scott rightly argues that those who stay outside of the state domain may not be civilized but are away from the modern governance structure (Scott 2009). The central argument is that the role of government, which is also a part of governance, cannot be downplayed substantially. It has its own mechanism on how to control the subjects. Even if it is governance, government still holds the upper hand. Some social scientists argue that the state has been hollowed out. But Bevir explains, "the states have expanded the mix of policy instruments. As the older coercive and regulatory instruments became less important, states developed softer

instruments by which to realize their intentions and control other actor. In this view the state has emphatically not been hollowed out" (Bevir 2012, 76). On the other hand, Bang (2004) writes that culture governance is about how political authority must increasingly operate through capacities for self-governance and co-governance. There is a need to act upon, reform, and utilize individual and collective conduct, so that it might be amenable to its rule. For Bang, culture governance represents a new kind of top-down steering approach. It is neither hierarchical nor bureaucratic but empowering and self-disciplining.

State plays the key role in enabling and facilitating the participation of other elements of the society. It provides the legal and democratic framework within which the non-state actors and the civil society can act and plan in steering the society. It is evident from the World Bank report that it wants to establish democracy in the developing parts of the world. It has mentioned in the report that its main aim is to establish democracy and weed out corruption. Though there is a dominant argument which has become prominent in the discourse of governance in favor of less government and more governance, the actual delivery of governance is dependent on the grassroots situation. At the local level, it is seen that leadership holds a decisive position in delivering services. But governance at the ground level (which is supposed to be impartial and neutral) is embedded within various social categories like caste, class, religion, ethnicity, and gender.

## Conclusion

The failure of the reformist policies adopted after World War II and the immediate postwar reconstruction period thwarted the faith on the state and were instrumental in creating an instant predilection toward non-hierarchical and cooperative form of governance. In the 1970s economic growth also slowed down, and it led to the search of alternative ways of socioeconomic development. Thus the steering of the society fell into the model of governance where the state, the market, and the civil society would effectively cooperate in the political steering of the society (Mayntz 1994). But the lack of self-regulating rule on the private actors has resulted in the transcendence of the interests of the private rather than the public. This deserves attention, as at the grassroots level, the civil society which is assumed to be a homogenous society is not a social reality per se and is embedded in different social categories like caste, class, religion, ethnicity, and gender. This deficit needs a conscious analysis to avoid serious democratic pitfalls.

## Introduction

Governance and human development decodified as good governance and sustainable human development (SHD) (Anand and Sen 2000; Knack 2002) and their multiple interactions (Sundaram and Chowdhury 2013) are the core of the development thinking from the 1990s, although they belong to different disciplines (political philosophy, science of public administration, international law, development economics). The cross-fertilized literature emerged from a coevolution of theories and policies, shifting the focus from increasing GDP, employment, "growth from distribution," "growth with distribution" toward the "people-value-place-based" development from which the Sustainable Development Goals (SDGs) are framed. Section "Overview: Theories and Operational Approaches" discusses methodological questions on the interdisciplinary literature and policy implications; section "SDG16 on Peace, Justice and Strong Institutions," according to the evolution from Millennium Development Goals (MDGs) to SDGs, discusses good governance as mean and goal of SHD focusing on SDG16; section "Conclusion" refers on open questions for future research.

### Overview: Theories and Operational Approaches

There is not a predominant paradigm on the relation governance and human development, but many combinations. (i) From A. Smith the dimensions of governance – rule of law, transparency, accountability, lack of corruption – are presumed merely for market performance and for growth's paths: the determinants of processes and reasons for these dimensions are not explained, and the underlying heterogeneous values are not contested. From the new institutional economics (NIE), they matter as means for economic development: according to an asymmetric power's distribution across individuals/groups, the quality of governance reflects efficiency and accountability of the involved actors and political negotiations of their voices (North et al. 2008). (ii) From the end of 1980s, contradictions between pro-market design of structural adjustment policies and the call for government in their implementation challenge orthodox views looking for a pattern of "adjustment with a human face" (UNICEF 1987) and for bottom-up institutional reforms. Built on Sen's capability approach (CA), human development profile over *n* dimensions of well-being – i.e., freedoms to live lives that person's value – becomes the ultimate goal of development, consistent with four principles: equity, efficiency, sustainability, and empowerment. (iii) Multiple equilibria approach (Ray 2000) *might* bridge NIE and CA: history and subjective aspirations are drivers of change, while policies and rules of governance are mechanisms of propagation of externalities created by roles and responsibilities across actors.

At operational level, development organizations suggest different working definitions and indicators on governance of/for human development (Human Development Index by UNDP and Worldwide Governance Indicators by World Bank); however, there is no consensus. Moreover,

casual relations between governance and human development are not clear. Following Bruntland Report (1987), "development meets needs of present without compromising the ability of the future generations to meet their own needs." Its underlying idea of "fulfilling basic needs" of each person is "too strong" because the moral and cognitive burdens for SHD are on individuals and "too light" because it does not specify what should be sustained and how needs evolve in valuable aspirations (Leßmann and Rauschmayer 2012).

The role of governance emerges here explicitly; the sustainability becomes a bridge between governance and human development, built on public actors' responsibility to provide merit goods and conditions for rule of law, transparency, accountability and higher participation, and on interdependent individuals/groups (Sachs 2012). The first Human Development Report (1990) is about "the process of enlarging people's choices"; subsequent HDRs focus on "the expansion of people's freedom to live long, healthy and creative lives" and on equitable provision of merit goods; the latter HDRs expand these dimensions of freedoms by including "freedoms to," "intrinsic freedoms" (e.g., multiculturalism, gender equality), and governance. Therefore, human development is not reductively legitimated within the economic well-being domain, but philosophically founded, for example, on Aristotelian ethics. In this line, the evolution from MDGs to SDGs is from measures against economic poverty toward universalistic entitlements to development, globally shared with intergenerational responsibility (Fukuda and Parr 2016). The paradigm of human development is translated into one of sustainable human development where a positive level of "genuine saving," enforced by good governance, is required to maintain economic productive base.

Anand and Sen (2000) contested that sustainability is implied by optimality; Ranis and Stewart (2005) investigate the two-way chains "growth-human development" providing a taxonomy of virtuous versus vicious countries. Dasgupta (2007) disentangles SHD determinants in capital assets (manufactured, natural, human, and their imperfect rate of substitution) and enabling factors (institutions); Neumayer (2012) classifies countries on different combinations of (high/low) level of human development and sustainable development. From these perspectives, SHD is not a spontaneous order because the paths from micro to macro well-being and from current to future well-being require shared knowledge, coordination, and cooperation. Moreover, the steering logic of governance is complex according with specific "theories and circumstances of justice" (Leßmann and Rauschmayer 2012). From "Governance and Development" (WB 1992), governance is part of the post-Washington Consensus as "the manner in which power is exercised in the management of a country's economic and social resources for development." Subsequent WB Development Reports are on "institutions for sustainable development," "centrality of citizens," "equity and development," and "conflict in fragile states." The 2017 report defines governance as "a process within a given set of rules (formal and informal) that shapes and is shaped by power" to implement policies World Bank (2017). Good governance as governance for development consists of seven components: democracy, human rights, rule of law, effective management, transparency/accountability, developmentalist goals, and a varying mix of policies (Gisselquist 2012).

NIE defines governance as a cluster of political institutions, state capacity, and regulation of economic institutions and suggests the nexus "governance-sustained improvement in human well-being"; governance matters to explain why countries "fail to choose policies that economist argue are Pareto-improving" (North et al. 2008). However, there is no a unique theoretical pattern of good governance for SHD but a "good enough governance" (Grindle 2002) because of the different institutional contexts and resources endowments. As Sundaram and Chowdhury discuss, there is no general empirical evidence on causal relations from governance to SHD (2013); however, two governance alternative strategies for development are identified: the "market-enhancing governance" and the "growth-enhancing governance" (Kahn 2009).

## SDG16 on Peace, Justice, and Strong Institutions

The 2030 Agenda for Sustainable Development (2030 Agenda) was adopted by 193 United Nations (UN) member states in September 2015 to address the global challenges of poverty, conflict, inequality, and environmental depletion. With the definition of specific goals that refer to the most pressing issues of our world, from the access to water to hunger, education, and health for all, it provides a framework of action and monitoring of progress in terms of economic, social, and environmental development for each country. The 2030 Agenda builds on the MDGs (UN 2015), by providing a more comprehensive framework with 169 targets referred to 17 SDGs (UN General Assembly 2015). With the ultimate goals to end poverty by 2030 worldwide and pursue a sustainable future, the Agenda presents an integrated view on people, planet, prosperity, peace, and partnership.

In particular, the SDG16 refers to peace, justice, and good governance and institutions as crucial elements of sustainable development (Fig. 1).

SDG16 defines as primary goal for sustainable development to *promote peaceful and inclusive societies for sustainable development, provide access to justice for all, and build effective, accountable, and inclusive institutions at all levels.*

**Governance and Human Development, Fig. 1** Sustainable Development Goal 16

With the SDG16 the UN wanted to underline (i) the importance of societies free from conflict and violence to achieve sustainable development and (ii) the importance of strengthening institutions at national level on rule of law and justice for all, transparency and higher and inclusive participation and, at international level, with the participation of developing countries in the global governance.

SDG16 calls for a multidimensional plan of actions to promote peace in terms of absence of violence (negative peace, targets 16.1 and 16.2) and build and enforce good institutions for more inclusive and resilient societies, sustaining positive peace as "attitudes, institutions and structures which create and sustain peaceful societies (IEP 2016)."

Effective, accountable, and inclusive institutions are key actors for the progress of humanity as a whole and in relation with the environment. Institutions, as primary organizations of societies and "rules of the game," matter for the capacity of the state to deliver basic services and the definition of concrete actions toward conflict prevention and long-lasting peace, resilience, and inclusion at national level.

SDG16 comprises 12 targets and 33 related indicators on **direct violence**, **drivers of violence**, **governance**, and **justice**.

The following are the SDG16 targets (Table 1):

The systemic approach needed represents itself the intrinsic challenge for the achievement of SDG16, with actions from different institutions and stakeholders at different timing and a high degree of coordination.

Institutions at governmental level have complex and sometimes highly bureaucratized structures that do not enable the correct provision of services. The management of power in many institutions is not balanced, and it represents a brake to effective actions and participation. The principle of interconnectedness, pillar of 2030 Agenda, is translated in the SDG16 in complex relations among and within different structures of power. To this regard, it is important to underline the role at playing by politics in institutions.

**Governance and Human Development, Table 1** SDG16 targets

| | |
|---|---|
| 16.1 | Significantly reduce all forms of violence and related death rates everywhere |
| 16.2 | End abuse, exploitation, trafficking, and all forms of violence against and torture of children |
| 16.3 | Promote the rule of law at the national and international levels and ensure equal access to justice for all |
| 16.4 | By 2030, significantly reduce illicit financial and arms flows, strengthen the recovery and return of stolen assets, and combat all forms of organized crime |
| 16.5 | Substantially reduce corruption and bribery in all their forms |
| 16.6 | Develop effective, accountable, and transparent institutions at all levels |
| 16.7 | Ensure responsive, inclusive, participatory, and representative decision-making at all levels |
| 16.8 | Broaden and strengthen the participation of developing countries in the institutions of global governance |
| 16.9 | By 2030, provide legal identity for all, including birth registration |
| 16.10 | Ensure public access to information and protect fundamental freedoms, in accordance with national legislation and international agreements |
| 16.a | Strengthen relevant national institutions, including through international cooperation, for building capacity at all levels, in particular in developing countries, to prevent violence and combat terrorism and crime |
| 16.b | Promote and enforce nondiscriminatory laws and policies for sustainable development |

The strategies followed by those who dominate the political settlement in using or neglecting institutions impact greatly on development outcomes (Whaites 2016). The political willing is crucial to put in place actions toward positive change in the formal structuring of institutions and on how the institutional powers are used and managed. Politics represents another strategic challenge that might hinder or empower sustainability and the coherence necessary to implement a comprehensive SDG16 policy program. Another element for the SDG16 paradigm is the political dimension of civil society movements to pressure governments on improvements at institutional level, requesting transparency and accountability of the system and/or at policy level on actions against direct violence or drivers of violence (i.e., human trafficking and arm trade campaigns). At institutional level, progress can be monitored analyzing advancement (if any) in service delivery and performance of the civil service as a whole. To this regard, changes in the administrative process as well as improvements in the structural and technical mechanisms within the institutions are determinant to achieve the goal.

SDG16 calls therefore for an integrated approach where the political dimension might be the push factor of change in the structure, organization, and mechanisms at institutional level, being different stakeholders involved from the public and the private sector.

Technical challenges refer to the measurement of SDG16 and to the monitoring of related actions. Data availability and reliability might represent obstacles to this regard. Moreover, as underlined by IEP, many National Statistical Offices (NSOs) do not possess statistical capacity and resources necessary to measure SDG16: a strong investment is needed to develop NSOs capabilities and techniques of measurement, escaping the potential for a capability trap. Third-party organizations already active in data collection and analysis on direct violence, drivers of violence, governance, and justice might play active roles as independent verification and additional support for NSOs (e.g., Small Arms Survey, the World Justice Project, Transparency International, the Peace Research Institute Oslo, Uppsala University).

## Conclusion

The nexus Governance–SHD represents a challenge from different points of view.

At methodological level for "reversal imperialism" and pluralism challenges, there is a need to map and define intra- and interdisciplinary perspectives that best contribute to explain the complexity of the nexus, to disentangle the relational and behavioral components of the different actors

involved, according to their power position and interests, by analyzing the evolution of capabilities through intersectional inequality. Further analysis on the multi-level governance is needed to better understand the networking mechanisms, formal and informal rules of such a system embedded in specific contexts.

At policymaking level, the influence of politics on institutions and governance should be more investigated through the lenses of the normative theories of justice and well-being, ex ante in policy making design and ex post in political bargaining. Referring to the SDG16 framework, a deeper analysis and a shared knowledge on factors of negative and positive peace should be integrated in a capability approach.

# Governance and Indigenous Peoples: New Challenges to Their Conceptualization and Implementation

Verónica Figueroa Huencho
Institute of Public Affairs-INAP, University of Chile, Santiago, Chile

## Synonyms

Indigenous institutionally; Indigenous people's development strategies

## Definition

A model that arises from the interaction of different actors, defined based on consensus, where spaces of power are shared from the establishment of rules defined from different epistemic, cultural, or political frameworks, with the aim of generating beneficial results for the whole of the society.

## Section

Latin-American and Caribbean.

## Introduction

In Latin America, indigenous peoples have acquired greater visibility due to cultural, territorial, economic, and/or political claims, emerging a new social and political actor that challenges not only the traditional ways of doing politics but also the institutional arrangements defined to accommodate them within the states (Bengoa 2000; Pairican 2014; Figueroa 2014, 2017a, b). However, the persistence of gaps in different fields shows the need to continue deepening the definition and application of relevant concepts aimed at improving its main development indicators.

According to the latest World Bank report on the progress in the Sustainable Development Goals (2017), Latin America presents the worst indicators associated with child mortality, access to water, health, and literacy, among others. Studies also show that the isolation of indigenous peoples from state formation processes, together with political decisions that affect their development, have affected the loss of land, the breakdown of community economies, and the loss of rights and representativeness, generating conditions of poverty (Kymlicka 2007). With this, the nation-state model is stressed, generating the need to seek new forms of interrelation between indigenous peoples, public and private actors, among others. It is here that governance emerges as an approach that can give useful answers to new demands of coexistence between indigenous peoples and majority societies, expressed in the interrelations that are generated between actors from the public, private, third sector, and indigenous peoples. The existence of unsatisfied demands, the tension between political institutionality, and the *cosmovisions* or ancestral expressions of these peoples, together with the persistence of conflicts in different contexts, realize the need to delve into mechanisms that not only improve the understanding of the process of indigenous public policies but also identify the critical nodes of it, to generate lessons and recommendations that contribute to an intercultural dialogue. In this context, emerging analytical frameworks such as those that arise from the "governance approach" can favor a better interpretation of the needs of these peoples, where their design and implementation acquire vital importance (Hufty 2008).

From this approach, Bevir (2013) points out that governance considers the processes undertaken by governments and that affect the lives of individuals, families, and formal and informal organizations, executed through laws, regulations, or other mechanisms that imply the exercise of power, where institutions are understood as structures composed of actors with different positions and roles that affect their results (Tsebelis 2000). Therefore, governance is not only a design where roles are assigned to the different actors involved in it but also to pay attention to the implementation processes, where the institutional framework will be impacted in turn by the governance model and where the relationship between the two will not always be virtuous. According to Van der Steen et al. (2015), the problems in the implementation of public policy may be in the policy itself but also in the institutions that make up the context of that policy, such as governance.

In that sense, it is necessary to promote an agenda that contributes to a conceptual clarification around the governance approach and its dynamics of implementation around indigenous peoples, which can support the decision-making of political actors to favor processes virtuous of

development and coexistence, always considering those cultural, social, political, or economic dimensions that arise from indigenous peoples. For this, it is necessary to advance in the following aspects: (a) what the governance approach means; (b) what are the challenges that arise in its design and implementation from the perspective of indigenous peoples; and (c) what are the implications of a research agenda in this area.

## Governance: New Challenges to Its Conceptualization from Indigenous Peoples

In societies increasingly permeable to the influence of international, national, local, and regional actors, it is necessary to account for the diversity of their environment, which has forced governments to seek novel forms of interaction with multiple actors, as well as design public policy interventions that require coordinated action between public, private, and/or third sector organizations (Zurbriggen 2011). This has led to the emergence of new approaches where we can locate governance, which has been defined in various ways in the literature as a "slippery" concept (Pierre and Peters 2000, p. 7) but where its conceptual imprecision has been the "secret of its success" (Schneider 2004, p. 25). The academic interest in this concept is relatively recent and is presented as a paradigm shift, being described as a model in which government, business, community groups, and citizens work together and share spaces of power to achieve beneficial results for all based on consensus (Hye 2000). In that sense, governance is a dynamic concept, so it is relevant to advance in both theoretical and empirical understanding (Farazmand 2012, p. 351).

From a political perspective, the World Bank defines governance as the set of traditions and institutions through which authority is exercised, which includes processes through which its authorities are selected, monitored, and replaced, the capacity of governments to formulate and implement public policies and respect for citizenship for the state, and the institutions that regulate economic and social interactions (World Bank 2016). For Pierre and Peters (2000), governance is the totality of interactions between public bodies, the private sector, and civil society, aimed at solving social problems or creating opportunities for society (Pierre and Peters 2000). From there, governance models are derived, understood as the mode of coordination exerted by governments on social actors, in order to solve collective action problems (Kooiman 2003). That is, governance tries to establish, promote, and support a specific type of relationship between governmental and nongovernmental actors (Howlett and Ramesh 2014). For Graham et al. (2003), governance is the interaction between structures, processes, and customs that determine how power is exercised and responsibilities are distributed, how decisions are made, and how citizens together with other actors can express their opinion. In that sense, governance is about power, relationships, and accountability.

However, in this discussion the tension of incorporating the worldviews of indigenous peoples into the theoretical and empirical discussion of the concept of governance is relevant. These worldviews, understood as the set or system of shared meanings through which reality is perceived and interpreted and that serve as a parameter to assess decisions and actions for a given group, community, or people (Gavarrete 2012), constitute a substantive analytical framework to identify tensions, gaps, and misinterpretations from Western political, institutional, and/or administrative designs. However, this also requires an ethical, political, and epistemological positioning (Melin et al. 2016). An example of this is the Az Mapu of the Mapuche people in Chile, a concept that refers to the organization of life and its complex relationship with "el che" (the Mapuche person), as well as its interaction with the *wallmapu space* (*Walmapu space* is the name that Mapuche people gives to their ancestral territories, located from central to southern part of Chile.) and its internal distribution, which can be an important reference for the generation of an effective governance approach.

For Cornell et al. (2004), when it comes to indigenous peoples, governance implies the establishment of defined rules from different epistemic,

cultural, and even political frameworks, on which we can depend to generate coordinated actions and achieve the proposed objectives, where these rules are the critical piece of the puzzle, because if they are not consensual and legitimized, it is likely that decision-making and its implementation are inconsistent, conflicting, and difficult. Governance is also valuable to indigenous peoples, even if the concept itself must be redefined in the light of its own epistemological frameworks.

In that sense, there are three factors considered crucial: the exercise of sovereignty (real power for indigenous peoples to make decisions); institutions with the capacity to generate governance (creating an environment conducive to sharing and implementing ideas, resources, and actions from the institutions of indigenous peoples); and the "cultural adjustment" (between the participating institutions and the cultures of the indigenous peoples, regarding how authority should be organized and exercised). To these factors must be added the need for strategic orientations (such as a vision that allows thinking, planning, and acting in the long term of indigenous peoples) and leadership (people with the capacity to influence, persuade, and generate confidence in decisions, especially from the point of view of indigenous peoples) (Cornell et al. 2004).

Therefore, governance cannot be treated as a neutral concept, since for indigenous peoples the control of their own interests (understood as the exercise of their autonomy), managed jointly with capable government institutions, with culturally appropriate processes and effective, is essential. However, autonomy is not only important for indigenous peoples, because, in the framework of a governance approach, synergy is also essential between the parties that make up the system. Thus, a governance approach must be understood as a system that involves politics itself in relation to its environment, with the organizations and with the actors that participate, where even being different entities, with different cultures, their acts and consequences are highly entwined (Van der Steen et al. 2015).

This allows us to talk about a "good governance," where the network of relationships should tend to have development being a decentralized system, friendly to the citizens, and attentive to their needs; with levels of political autonomy; with efficient and responsible institutions; and with an empowered civil society (Huque 2001; Minocha 1998). The incorporation of contemporary analytical models such as the governance approach can, therefore, favor improvements in the implementation of indigenous public policies and extract learning for other contexts. This means relieving the role of the state, political institutions, interactions between actors, and the influence of social, economic, or cultural environment factors, among others. In that sense, given the complexity of the problems that current societies must face, it is important to incorporate new dimensions into the analysis of governance, with the understanding that their implementation cannot be analyzed only from an individual perspective, since their results can be based on structural determinants of the political system, of the public sector, or in the interactions between the two (Peters 2015).

According to McConnell (2016), the governance approach provides a broader vision of analysis when considering the convergence of aspects of political design, the identification of the problem, the actions developed by the organizations involved, the interactions that occur between them, as well as the actors that participate and that even influence their configuration by putting their own values and interests into play. Therefore, the implementation of governance is crucial due to the multiplicity of interests and visions that are contrasted but especially because of the incorporation of different worldviews, valuations, and knowledge, typical of each indigenous people, often of an ancestral nature, which are not considered in the analysis frameworks coming from Western epistemological frameworks.

## Implementing Governance from an Indigenous Perspective

The Latin American experience shows that governments have sought different strategies for implementing public policies, giving rise to different governance models. In this way, although

several states have given recognition to these peoples in their political constitutions (such as the cases of Bolivia, Colombia, Venezuela, Ecuador, or Peru) or have ratified International Covenants or Agreements (those that have an impact on the normative or legal configuration of each country) (Fuentes and de Cea 2017), one of the main challenges they have faced is the search for the most appropriate institutional designs to specify, through implementation, the rights there they recognize.

Indeed, progress in indigenous rights has had a direct impact on the institutional configuration. It is there where we see experiences of countries that have established territorial spaces with certain degrees of autonomy (such as Panama, Bolivia, Ecuador, or Colombia), or have modified political institutionality by defining parliamentary quotas or specific judicial systems (as is the case from Ecuador or Colombia), or have adjusted administrative institutionality, creating organizations with responsibilities to formulate and/or implement public policies (at the ministerial level or of agencies and/or public services), or cooperation networks between diverse organizations have been articulated (both inside and outside the public administration), or the inclusion of indigenous managers has been promoted in order to promote greater representation of their interests, among other strategies.

The implementation of governance can be considered space where actors compete and negotiate to obtain control of resources, affecting their results but also leading to the introduction of adjustments to this approach (Hasenfeld and Brock 1991). In that sense, this implementation seeks the execution of a set of activities aimed at achieving the goals established for state interventions (Olavarría-Gambi 2017a), which is the complex process of putting political decisions into practice, through a variety of mechanisms and procedures. In that sense, governments have the prerogative to design a large part of the scope that governance will have in terms of its implementation because they control the allocation of resources, provide rules, manage institutions that establish "who gets what, where, when and how," and administer the symbolic resources that are the basis of the legitimacy of their actions (Howlett and Ramesh 2014). For Peters (2015), the governance approach also shows the multiple biases that are present in the political and bureaucratic institutions and that will have a correlation in the implementation.

Some authors suggest that, from a governance approach, the implementation process should be analyzed as a consequence of three "imperatives": respect for the spirit of laws, public servants' concern for instrumental rationality, and coherence between the organizational and political-institutional design. Van Meter and Van Horn (1975) point out that the implementation will be characterized by financial resources, political support, economic and social conditions, the type of organizations involved, communications between management and political level, and the provision of the functionaries. For their part, Hasenfeld and Brock (1991) established five types of dimensions that influence the implementation process from a governance approach, identified as "domains of driving forces": the search for rationality, the adjustment of the organization and the bureaucratic politics, discretion and adaptation, power relations, and leadership and competence level. According to Olavarría-Gambi (2017b), these driving factors are directly related to the sector in which public policy is located, which vary from aspects associated with leadership to others linked to power.

Mazmanian and Sabatier (1989) point out that the success or failure of public policy will depend on the regulatory and management structure adopted in its implementation and to what extent they respond to the characteristics of the target group. Vancoppenolle et al. (2015), in a comparative study of public policies, identified a series of dimensions that should be considered in the analysis of their implementation from governance: organizational and interorganizational behaviors, level of skills and interests of bureaucrats, interest group expectations, and the incidence of power actors. For its part, May (2012) points out four aspects that can be considered: (a) values, interests, and contents of public policies; (b) policy instruments; (c) ways in which the implementation structure generates "alerts" about the courses

that the policy should have; and (d) the target group. Therefore, the process of implementing public policies is complex, being influenced by the selected policy instruments, the organizations that will administer it, the type of participating actors, the recipients, but especially by the relationship with the political-institutional design.

In the case of indigenous peoples, it is relevant to consider systemic implementation strategies, where the Hufty model (2008) has been especially useful as it clearly identifies the collective, formal, and informal processes that determine how decisions are made and proposes a model of analysis from the governance centered on five categories: (1) the problems (what is at stake), (2) the actors (individuals or mobilized groups understood as counterparts or "stakeholders"), and those who undertake collective actions (agreements or decisions) that lead to the formulation of (3) rules (or rules of the game or decisions) that guide the behavior of the actors and are modified by this collective action. For this author, this collective action results from the interaction between the actors, whether conflictive or cooperative, of the transactions, agreements, and decisions that are made and their application. Interactions can be observed in (4) nodal points (physical or virtual interface spaces where problems, processes, actors, and norms converge) and (5) processes (successions of states through which the interrelation between actors, norms, and nodal points). The processes, the actors, and the norms can be formal, that is, recognized by the actors carrying authority in the observed society (this recognition is "legal" at the level of the societies endowed with a positive right), or informal, defined by the practice of the actors (Benavides and Duarte 2009). The characterization of the interactions between these elements will be equally relevant (McConnell 2016).

However, as noted, the indigenous dimension involves considering new analysis variables to models of this type, in order to capture the dynamism and complexity involved in the design and implementation of governance in multicultural contexts. Cornell and Kalt (2000) argue that the analysis of governance from an indigenous perspective implies considering the effectiveness and legitimacy expressed in the institutional framework that originates in its implementation. This means that the definition of the participants and their interactions, their definitions of power, and the mechanisms to adopt and implement decisions must be appropriate to the reality of indigenous peoples. For these authors, Western governments tend to be much more interested in effectiveness than in legitimacy when designing governance models.

On the other hand, for indigenous peoples, although effectiveness is relevant, they tend to be focused mainly on legitimacy as a basis for their survival, so the elements of a governance model must be analyzed from indigenous perspectives. Also, recent studies in the USA and Australia show that governance can be more effective if it considers aspects such as (a) stable and broadly representative organizational structures of indigenous peoples; (b) capable and effective institutions; (c) corporate governance systems with territorial presence; (d) separation and limitation of powers; (e) fair and reliable conflict resolution and appeal processes; (f) effective financial management and administrative systems; (g) simple and relevant information management systems at the local level; (h) effective development policies and realistic strategies; and (i) cultural adjustment of practices and processes (Sullivan 2007).

In the Latin American case, a study by the Indigenous Fund (2007) shows that institutional designs around indigenous peoples require progress in participation, relevance, and resources for real effectiveness, given that the nature, physiognomy, and contents of state institutions that they have dealt with indigenous affairs have followed a path of marginalization of them (Indigenous Fund 2007). Therefore, implementation is critical in the success or failure of a governance model. An interesting conclusion of this study is that there is broad participation of indigenous representatives in the formulation, but not in the implementation of the policy, thus losing their emphasis and guidance. The World Bank (2014) indicates that indigenous public policies need to be rethought at all stages, especially in implementation.

This is important because it is in this process of implementation that deficiencies can arise that

stress the character of the governance approach and can lead to the emergence of new demands around them. While it is virtually impossible to isolate the effect of political institutions from the success or failure of a policy, most research tends to treat these effects as secondary, compared to the nature of the design itself. In other words, the causes of the failure (and success) of governance tend to be seen as endogenous, leaving aside the analysis of the impact that institutional design can have on it (Peters 2015).

Therefore, it is important to consider that the diversity that indigenous peoples bring could suggest that there is no single concept of governance that adapts to all circumstances or contexts, which requires openness to identify dimensions that may be stable, as well as others that require territorial, ancestral, or other adaptations. This allows us to think about the possibility of multiple frameworks and areas from different potential causes, testing the governance approach itself.

## Governance as a Concept in Reconstruction: Implications for a Research Agenda

In the field of indigenous peoples, both literature and empirical evidence show that governance approaches have influenced the achievement of varied results, which have often influenced the persistence of multicultural claims due to poor adequacy of Western decision frameworks to the needs of important population groups that have differentiated epistemological frameworks. As noted, indigenous peoples are political actors that have influenced the political agenda of several governments and that in the Latin American case continue to press for modifying homogenizing institutional designs, not appropriate for diversity contexts.

In that sense, the definition and implementation of governance are complex due to the nature of its aims and the actors involved, both in its execution and those who are recipients of it. In general terms, aspects such as the lack of institutional adaptation; the scarce integration of cultural, value, historical, and social elements in the programs and projects; the ignorance on the part of political or bureaucratic actors; as well as the diversity of visions of these peoples have been indicated as factors that influence their results (Parvin 2009).

However, little is known about the way in which these dimensions interact to influence their characterization. Various studies realize this. Alkire (2005), in a study on indigenous poverty and public policies, focuses his criticisms on the following aspects: (a) limited and biased scope of the programs linked to policies by not understanding the cultural influence of a people, assuming erroneous positions about behaviors or values; (b) imposition of values, deliberately attempted to change cultural norms or practices that are considered negative but are not understood in diverse cultural contexts; (c) existence of untapped resources, especially for not taking into account their working methods, forms of relationship, cultural wealth, etc.; and (d) unpredictability of unwanted impacts, where the results of the policies can generate new problems.

In that sense, the diversity of strategies in which political decisions are implemented, as well as the multiple actors involved in them, can cause tensions to the governance system or to the results. In the case of indigenous peoples, the diversity of strategies chosen by governments has resulted in dissimilar results. As some authors point out, it is required not only to question the governance models but also structural aspects of the context, because "state projects are still caught in old concepts, where there is no real political will to arbitrate the relevant measures in terms of the latter having real possibilities of development" (Walsh 2006, p. 8).

Advancing an agenda that can put tension on defined concepts from a single epistemological framework can favor better effectiveness in decisions about governance and its implementation, which also advocates a discussion from different disciplinary fields, considering one's own indigenous peoples and their demands, as essential parts of the analysis model (Tuhiwai Smith 2008). Research in this area is still incipient. However,

its progress could generate diverse contributions to a better understanding of the emerging problems around indigenous peoples, from making new dimensions of the problem visible to providing diverse solutions to long-standing demands.

## Synonyms

Public diplomacy; Sino-US relations; Soft power; Transition

## Definition

Public diplomacy is a strategic way to disclose the government to the domestic and international public. The aim of public diplomacy is to form a good image of the government and thus the power of attraction. Public diplomacy is seen as an efficient way to exert soft power. By the means of media and social media, diplomacy becomes the hilarity among the public and the important channel for the government to be close to civilian with certain political intent.

## Introduction

It is difficult to deny that the relation between China and the United States has an influence on world affairs. The United States is the superpower in the world and China is also a giant who is chasing after it. China replaced Japan as the world's second largest economy in 2010 and has been projected to surpass the US economy by 2030 (Barboza 2010).

These two countries have much cooperation in areas such as energy, security, and trade. The fortunes of China and the United States are tying together. Communication, therefore, becomes essential between these two countries. In the new era, public diplomacy is regarded as an effective way to communicate and interact with foreign countries and its publics. On the one hand, public diplomacy is different from traditional diplomacy which is from government to government – the elite to elite; instead, it actively builds a bridge

between government and foreign publics, between publics and foreign publics – elite to mass and mass to mass. It aims to build mutual understanding and respect through dialogue.

On the other hand, it is the important instrument in wielding soft power. It has the side of strategic communication. As McQuail (2010) defines it as "a term to describe the efforts by nations to win support and a favorable image among the general public of other countries, usually by way of news management and carefully planned initiatives designed to foster positive impressions" (p. 568). Moreover, Nye (2008) pointed out politics has become the competition of credibility (p. 100). Similarly, Ronfeldt and Arquilla (2007) suggested that politics in the information age is about whose story wins explicitly or implicitly.

Whether public diplomacy is used as general communication or strategic communication, media play an important role. Media are the direct and influential channel for public diplomacy to work, because it can reach to the worldwide audience rapidly. Moreover, social media can help deliver an exchanged diplomacy because social media are featured by trans-geographical, real-time transiting, interactive and networked. In fact, public diplomacy through social media such as Twitter has become popular since the Obama administration took office (Cull 2013, p. 132).

Public diplomacy by social media is embraced by the Department of State; Secretary of State Hillary Clinton has a team of bloggers to post her activities on blog and Twitter (Khatib et al. 2012, p. 454). Also, US diplomats open blogs or use Twitter to reach out to people (ibid., p. 454). In China, the US Embassy in China has launched its Weibo (Chinese version of Twitter) to communicate with the Chinese people (Zhong and Lu 2013, p. 542). In the information age, however, the flow of information is difficult to control.

To a large extent, it is both a challenge and opportunity for doing public diplomacy through social media. Moreover, in coincidence with the information age, the world power is transiting from the West to Asia, especially the rise of China (Nye 2011a). Then in the context of power transition, how the United States exerts public diplomacy by social media to China is necessary to be analyzed.

## Soft Power

In the seminal work *Soft Power*, Joseph Nye (1990) analyzed the changing face of power in the post-cold war period. In that article, he argued that the traditional way of testing power which is to measure military power is becoming less important, while factors such as technology, education and economic power are becoming more important in the interdependent world (ibid., pp. 153–154). Moreover, power is diffusing from governments and great power to private actors and small states (ibid., p. 162).

According to Nye (1990), there are five factors contributing to the diffusion of power: "economic interdependence, transnational actors, nationalism in weak states, the spread of technology, and changing political issues" (p. 160). After identifying these trends, he suggested a more attractive way to exert power – " ... One country gets other countries to want what it wants might be called co-optive or soft power in contrast with the hard or command power of ordering others to do what it wants" (ibid., p. 166).

In his following books on soft power, Nye (2004) defined soft power as "the ability to get what you want through attraction rather than coercion or payments" (p. x). Put another way, it is the ability to make others want what you want without force or payments. According to Nye (2011b), soft power can use attraction to change one's existing preferences, to make an agenda seen as legitimate and shape one's initial preferences (p. 91). Meanwhile, agenda-setting, persuasion and attraction are three kinds of soft power behaviors which can help soft power to achieve the preferred outcomes (ibid., pp. 91–92). These three behaviors coordinate with each other. Attraction can generate from persuasion which is to use argument to influence the beliefs and actions of others without force or payment; setting agenda can help argument more persuasive by emphasizing on messages you desired while falling others by the wayside (p. 94).

Furthermore, Nye (2011b) pointed out that attraction derives from three fundamental resources: culture, political values and foreign policies (p. 84). Goldsmith and Horiuchi (2012), however, criticized that the resources of soft power described by Nye are invariant (p. 558). Likewise, Hayden (2013) suggests that "a soft power resource like 'culture' is more than a stable guarantor of attraction, but contestable medium for influence" (p. 202). After these critiques, Nye (2011b) has further developed an updated concept which is called smart power. He defined smart power as "the ability to combine hard and soft power resources into effective strategies" (ibid., pp. 22–23). He found that sometimes, military resource can generate soft power but a misuse of hard power will undercut soft power (ibid., p. 89). For example, he argued that the initial American military invasion of Iraq in 2003 might generate admiration from others; however, the scenes of mistreatment of prisoners undercut that soft power (ibid., p. 89).

Similar but different understanding, Mingjiang Li (2009) argued that "soft power does not exist in the nature of certain resources of power but rather it has to be nurtured through a soft use of power" (p. 3). Based on those ideas, Chen and Chang (2013) developed four categories of the application of power: soft power, soft use of soft power; soft hard power, soft use of hard power, for example, economic and military aid; hard power, the hard use of hard power, such as war and economic sanction; and hard soft power, the hard use of soft power, for example, institutional coercion could be the promotion of a change of regime and cultural coercion such as wars of Propaganda (p. 11).

## Public Diplomacy

Public diplomacy is the channel for soft power to be generated and exerted.

Malone (1985) defined that public diplomacy is "one of direct communication with foreign peoples, with the aim of affecting their thinking and, ultimately, that of their governments" (p. 199). That definition worked better in cold war period. At that time, Voice of America (VOA) constantly broadcasted programs to the Soviet Union and had changed people's attitudes toward America (Cowan 2004, pp. 233–234).

Cowan (2004), however, pointed out that the VOA was not the key to success rather it was the broadcasting of the good policies that worked (p. 234). In the information age, the definition of public diplomacy is not that direct and simple, since contemporary concept of public diplomacy has included the new public diplomacy and soft power (Cull 2009, p. 10). The new definition is that "an international actor's attempt to manage the international environment through engagement with a foreign public" (ibid., p. 12). Engagement, the process of interaction and dialogue with foreign publics, has become the core of new public diplomacy (Comor and Bean 2012, p. 204).

According to Cull (2009), there are mainly five aspects that constitute engagement: listening (engaging a foreign public by listening and then adjust one's policy), advocacy (engaging a foreign public by explaining one's points of view), cultural diplomacy (engaging a foreign public by exporting one's culture), exchange diplomacy (engaging a foreign public by helping direct contact between one's own people and foreign people), and international broadcasting (engaging a foreign public by providing news and information) (pp. 17–21).

There are other important aspects related to new public diplomacy. Communication has become more fluid, multi-directed and networked because of the development of communication technologies and internet. It enables the public to engage with each other without the barriers of geography and time. In addition, the communication revolution has increased the importance of public opinion in the process of conducting foreign policy. Therefore, the term for the public diplomacy use of online media – public diplomacy 2.0 has joined the term of new public diplomacy by 2008 (Cull 2013, p. 124). According to Cull (2013), there are three key features in public diplomacy 2.0: it utilizes the capacity of technology to facilitate online relation building; it depends on user-generated content; and it enables the horizontal networks of information exchange

rather than the traditional vertical hierarchical exchange (p. 125). Because of these characteristics of online public diplomacy, Cull (2013) argued that public diplomacy 2.0 can cover all principal areas of engagement as discussed above to facilitate public diplomacy work (p. 125–126).

Public diplomacy 2.0 is a form of exchange diplomacy which operates through networks and people-to-people connection (ibid., p. 126). It departs from the "actor-to-people Cold War-era communication" and arrives to an emphasis on "people-to-people contact for mutual enlightment" (Cull 2009, p. 13).

Moreover, in the information age, new public diplomacy needs to attract people's attention. It is because there is an explosion of information which has produced a "paradox of plenty" (Simon 1998, pp. 30–33). "...people are overwhelmed with the volume of information confronting them, it is hard to know what to focus on, attention rather than information becomes the scarce resource and those who can distinguish valuable information from background clutter gain power" (Nye 2008, p. 100).

## Social Media and Public Diplomacy

Social media, to a large extent, can both achieve engagement and catch people's attention. For example, its successful use in Obama's election campaign in 2008 has been seen as a new important element in affecting politics, for its attraction to young people and connectivity to many (Harfoush 2009, p. VIII).

On the one hand, new media has enabled a new social environment. It changes the nature of participation in online reading and writing "where the online audience moves beyond passive viewing of web content to actually contributing to the content" (Sweetser and Weaver Lariscy 2008, p. 179). Moreover, the use of social media like Twitter has the potential to achieve the goal of the excellence theory in public relations (Grunig et al. 2002). The theory classifies public relations practice into four models: one way or two way and symmetrical or asymmetrical (Gilboa 2008, p. 65).

It finds that it is useful to use the concept of two-way asymmetrical communication and two-way symmetrical communications to study public diplomacy (Yun 2006, pp. 287–289). Two-way asymmetrical means communication is sent and received but with limited effects on the receivers and no effects on the senders, while two-way symmetrical means both senders and receivers are affected through communication although might not be equally affected (Yepsen 2012, pp. 9–10).

There is one trend that argues that social media can be strategically used in public diplomacy. Zhang (2013) analyzed several public diplomacy cases from the United States to China; she identified four phases of social media use in public diplomacy: (a) issue ferments and goes viral (signs of issue emerge on social media and diplomats decide to act or not, at this phase, a triggering issue could make the event go viral); (b) proactive phase (diplomats could do research on the viral trends, to reinforce the preferred trends by using traditional or social media to form the agenda and crystallize the public opinion; (c) reactive phase, (diplomats' actions could cause conflicts on targeted country's social media and attempt to negotiate); and (d) issue recedes and a new issue ferments, (the issue starts to fade, but organizations can still communicate with its key audiences to build long-term relationships through social media, meanwhile new issue could ferment on social media) (p. 1325).

Similarly, Li and Wang (2010) suggested that America's e-diplomacy uses strategic communication to "set media agenda, create new frames, design news context, and form speculative narratives about sensitive topics" (p. 9). It imposes its own value system to the rest and leads to spiraling public opinion pressure in target countries, therefore, causes confrontation or ethnic unrest within those countries (ibid., p. 9).

Yet, in practice, it should be cautious about public diplomacy 2.0. For the reason that media is a two-edged sword. The information is difficult to control. Kelley (2010) suggested that practitioners of public diplomacy 2.0 should realize that the proliferation of ICTs leads to a loss of government control in information flows (p. 296).

The grassroots nature of social media makes it both "difficult and somewhat undesirable to control them" (Dale 2009, p. 8).

Another trend is to examine the contradiction between the discourse of public diplomacy 2.0 and its practice in the real world. Edward Comor and Hamilton Bean (2012) argued that the engagement described by the US government as interaction and dialogue with foreign publics, mutual understanding and mutual respect is in fact to use social media and related technologies to persuade "skeptical audiences to empathize with American policies" (p. 203). They argued an alternative ethical public diplomacy which embraces genuineness, and not a sophisticated manipulative dialogue should be pursued (p. 203). They think, however, it might be difficult if the United States does not do an explanation "explaining not just to the World but also to itself the reasons for its repeated hypocrisy concerning human rights, its political-economic priorities in the Middle East, and its ongoing support of corrupt and oppressive regimes around the world" (p. 215). An examination of the performance of the US Digital Outreach Team (DOT) in the Middle East which uses social media to explain US foreign policy and to counter misinformation shows that DOT posts generate more negativity and DOT itself is not popular on the analyzed sites (Khatib et al. 2012, p. 466).

As Nye (2008) writes "even the best advertising cannot sell an unpopular product. Policies that appear as narrowly self-serving or arrogantly presented are likely to prohibit rather than produce soft power" (p. 102).

From the perspective of strategic communication, Cull (2011) explains that Web 2.0 enables "someone like me" – like-minded people – to constitute a tribe which is a tailored environment with their own tastes (p. 4). Therefore, it might be counterproductive if that intervention is seen as at odds with the identity of the site (ibid., p. 4).

## Twitter and Public Diplomacy

Twitter has the dialogic nature. It meets the public diplomacy requirement of bidirectional engagement and high interactive speed with little time (Yepsen 2012, p. 14). Boyd et al. (2010, p. 1) argued that a retweet is a type of conversation: "While retweeting can simply be seen as the act of copying and rebroadcasting, the practice contributes to a conversational ecology in which conversations are composed of a public interplay of voices that give rise to an emotional sense of shared conversational context." Most study on Twitter focuses on social influence.

Cha et al. (2010) identify three types of Twitter influence: indegree influence, retweet influence, and mention influence. Indegree influence refers to the number of followers a user has; retweet influence shows a user's ability to generate content with spreading value; mention influence measures the ability of a user to join a conversation (ibid.). The other trend of influence study suggests to identify topic-related hashtags (user-generated coding for searchable terms) about a particular issue such as #ObamainBrazil and then measuring the frequency of related posts, the number of followers and retweets or the comments related to the topic (Fisher and Montez 2011). Moreover, there are studies on why people use twitter; Zhao and Rosson (2009) identified three motivations: (a) personal updates about their life in order to keep touch with friends and colleagues, (b) allow posting real-time information, and (c) gather information useful for their work and other personal interests (p. 247). In addition, because of these characteristics of Twitter such as real-time information updates, high speed of interaction, and availability in searching for hashtags, Twitter and other social media are thought to play an important role in political activism.

Arab Spring in the Middle East and North Africa gave inspiration to the assumption that social media can change politics and overthrow the authoritarian (Khondker 2011, pp. 675–676).

However, Khondker (2011) reminds us that it works partly because of the absence of an open media and a civil society in that region (p. 675). Moreover, Burns and Eltham (2009) examined Twitter's role in Iran's 2009 election crisis, in which the United States used social media and Twitter to intervene the crisis and provided technology support to the Iranian activists; however,

they reveal that Twitter can also be used by Iran's "violence specialists" to identify and hunt down pro-democracy protestors (p. 306).

## Findings

The tweets sent by the US Embassy in China are in Chinese simplified characters. If there appear English words, it will provide corresponding Chinese translations. At the starting year of 2010, tweets about *Sino-US relation* and *American politics* are dominant categories. The category of *Other*s, however, follows after those two categories, ranking as the third dominant part in 2010. Category *Figures* rank the fourth (Fig. 1).

In 2011, *American society* is the dominant message, followed by *Sino-US relation*, *Figure*s, and *American politics* (Fig. 2).

In 2012, the top one category is still *American society*. The other tops are *Figures*, *American politics*, and *Sino-US relation* (Fig. 3).

In 2013, *American society* category ranks the first. The other top four are *Customer service*, *American politics*, and *Science* (Fig. 4).

In 2014, the top four are *American society*, *Science*, *Figures*, and *Environment* (Fig. 5).

From these five charts, it can conclude that *American society* is the dominant content in the tweets from US Embassy in China. That category ranks as the top one in 4 years except the first year of 2010. *American politics* and *Figures* categories also dominate the top four in 4 years. Topics about

**Governance and International Development, China, Fig. 1** Tweets in 2010 by themes. (http://weibo.com/usembassy)

**Governance and International Development, China, Fig. 2** Tweets in 2011 by themes. (http://weibo.com/usembassy)

**Governance and International Development, China, Fig. 3** Tweets in 2012 by themes. (http://weibo.com/usembassy)

**Governance and International Development, China, Fig. 4** Tweets in 2013 by themes. (http://weibo.com/usembassy)

**Governance and International Development, China, Fig. 5** Tweets in 2014 by themes. (http://weibo.com/usembassy)

**Governance and International Development, China, Fig. 6** Total tweets by themes. (http://weibo.com/usembassy)

*Sino-US relation* is decreasing from top one in 2010 to the last one in 2014. Tweets about *Science* have increased greatly in the last 2 years. Environment issue also ranks up to the fourth in 2014.

In Fig. 6, we can see the frequency of the themes of the overall data across 5 years. Stories about American society are overwhelmingly more than the other categories which account for more than 20% of the whole tweets analyzed in this research. However, *Others* category is more than *Science*, *Environment*, and American history.

The frequency of top 10 retweeted topics by themes in each year has a similar pattern with the one in Figs. 6 and 7.

The analyzed tweets are categorized into nine themes. The category with the most tweets is *American Society* (1446, 20%). American society is the core message delivered to the public in

**Governance and International Development, China, Fig. 7** Top 10 retweets by themes from each year. (http://weibo.com/usembassy)

China. The large number of tweets describing American society can be interpreted in two ways. The superficial meaning is to give the Chinese population a precise picture of American society which can promote a better understanding about the United States. Moreover, the positive portrayal of American society creates the sense of attraction. The implicit meaning is to form a comparison with the Chinese society. To some extent, it generates an impression that American society is superior to Chinese society.

According to online polls conducted ahead of China's annual parliamentary and political advisory sessions in 2011, the top 10 concerns by netizens are social security system, judicial justice, personal income, fighting corruption and building a clean government, environment protection, housing price control, healthcare reform, stabilizing prices, food safety, and reform of education ("Housing and social security" 2011).

In the analysis of these tweets, it is not difficult to find that some tweets are specific to those concerns. For example, tweets about housing: "What do you spend in buying a house in Washington... houses as shown below, 3 bedrooms with 2.5 bathrooms, living area of 250 square meters, covering an area of about 2 mu, 30 minutes' drive from downtown Washington. The single-family house, at present the market price is 400000 US dollars" (6066 retweets) (translated by the author, http://weibo.com/usembassy). Tweets about food security:

> "America's food safety: many years ago once visited a poultry slaughter houses in State of Delaware, there are two things that cannot be forgotten. One is that the mixed feather and manure wastewater in the abattoir can discharge directly into the stream outside the factory after a strict treatment. The factory technician challenged us: how about having a drink of the water? We looked at each other, no one dares. Then he bent down to pick up the water and drunk up" – 1393 retweets (translated by the author, http://weibo.com/usembassy)

These tweets are not innocent since they appear when certain topics are hot debated in Chinese society. They are very responsive to issues that happened in Chinese society. If these tweets appear in countries with the same developed level, it might not catch people's attention. However, in a developing country like China, its development is not mature and balanced; more important, its society has some problems. The appearance of those tweets is likely to be interpreted as a superior American society, at the same time, embarrassing the Chinese government.

Moreover, it often introduces American culture such as festivals (since America is an immigrant country, it will present varieties of cerebration activities from different ethnicities). It could generate a feeling that American society is cultural pluralism, inclusiveness, and openness. The introduction of American music, famous literature work, Hollywood, the Oscars, and the description of beautiful scenes of the 50 states in the United States are to build a good image of the United States.

Categories *American politics* and *Sino-US relation* have similar amounts of tweets (835,833). They share the second and third highest number of tweets. These two categories have a distinct change in the ranking order in the yearly chart. In the first year of its launch of Weibo account, these two categories are overwhelmingly majorities. In the following years, although they still remain a large number, the category of *American society* becomes dominant.

By a close reading of these tweets about American politics, especially in the first year, it seems that the messages are rather aggressive which demonstrate the superiority of American political and legal system or it can be seen as the dissemination of American "democracy." For example, in 2010, it listed all the ten amendment Bill of Rights in both Chinese and English. In 2012, it posted tweets with hashtag such as "#American Presidential Election," "#Knowledge of American Presidential Election," and "#Terminology of American Presidential Election." These tweets have a detailed description of the process of election, the regulation, and law for preventing illicit campaigns. Moreover, tweets about the local government budget and finance, individual income tax of the president, and property declaration system for government officials show the transparency of the US government.

This, with no doubt, gives its counterpart the Chinese government a hit, since the Chinese government is often criticized as non-transparent and for the lack of a system to supervise its officials. One of the top retweeted tweets in 2013 is "In the United States, although the majority's salary is confidential, but there is a small number of people's salary must let the public know. They include the President, Vice President, Members of congress, the head of government departments and the federal court etc. Moreover, staff in the White House also needs to publicize their wage. According to 2011 report, the lowest salary of staff working in the White House is $41000 and the highest is $172200" (2,273 retweets) (translated by the author). Moreover, from 2011, the air pollution bothered the public and government officials in Beijing. The disputation between the US Embassy in China and the Chinese government about the measurement of air pollution has dominated Chinese media (Zhang 2013, p. 1323). Chinese officials argued that the US data might confuse the Chinese public since they use a different method to measure and demanded the US Embassy in China to stop monitoring the air quality (Chin 2012). During the disputation period, the US Embassy in China had sent a tweet to explain American measurement criteria for air pollution which is to counter the misinformation. In the end, the Chinese government urged that all urban areas in China must measure PM 2.5 by 2016 (Zhang 2013, p. 1325). Thereafter, tweets about American regulations and laws for food security and air pollution are increasing.

Therefore, in the coding scheme, it has to categorize the environment.

Tweets on international issues focus on American contribution to international problems, such as American funding for aids. If it is related to politics such as World Human Rights Day, it will reinforce and promote their political stance and value. This would give people the impression that the United States is playing a constructive role in world affair.

In terms of figures, Obama is portrayed as a brave and smart president in addressing serious issue, a good husband and father, and friendly, easy-going, and approachable to his public. There are many good photos about Obama and Michelle posted under the tweets; this can be analyzed by semantic methodology, however, beyond this research. The most retweeted post in 2011 is

> "Today Vice President Biden and his fellows – 5 people, they ordered five bowls of noodles, 10 steamed stuffed buns… the total cost is 79. Vice president Biden said to the shopkeeper that I have brought a lot of inconvenience to you. He took out 100 yuan to check out; in American custom, he gives the rest as tips to the shopkeeper" Retweets (47099) comments (23181) (translated by the author, http://weibo.com/usembassy).

The second one is a tweet with a picture of "Biden accompanied by Ambassador Gary Locke, tasted Beijing noodles with his granddaughter and say "hello" to other customers" (retweets 6,259, comments 2,630) (translated by the author).

The images of US government officials are portrayed as humble, saving, and approachable. They are in sharp contrast to Chinese officials who are regarded by the public as corrupted at that time.

The other main topic in figures is women. It tells stories about successful women and that they have equal right with the man; American women have political rights, for example, tweet that tells that women won more congressional seats in 2012. Stories about African-American leaders and Asian-pacific American figures, disabled people who can take part in election, can demonstrate that people living in the United States have equal right.

In the analysis of the category of customer service, it finds that it helps to connect the online information with offline environment. Some activities are to reinforce what has mentioned in tweets from other categories. For example, when talking about environment issue, the activity of that week might be to view a film about environment problem. This behavior could reinforce its online ideology and value and attempt to affect the offline life of the public in targeted countries.

In the last 2 years, we see a different change in the ranking of themes. Category *Science* and *Environment* increased sharply, while *American politics* and *Sino-US relation* has decreased. This is probably related to the change that a new Chinese government led by President Xi Jinping is smashing corruption and leading economic and political reform with the campaign of "China Dream" (Hatton 2014). Now the whole Chinese society is inspired by China Dream; therefore, the decreasing of *American politics* and *Sino-US relation* might be a self-adjustment of the US Embassy in China according to the change of Chinese society. The *Science* category has increased radically. This might be an attempt to sell the soft power of technology.

The pattern of the top 10 retweets from each year remains roughly the same with the one of the whole data. *American politics*, *American society*, *Sino-US relation* and *Figures* dominate the first four. The five most retweeted posts by the netizens are as follows:

- 2010 Obama's speech about education equity, work dignity, and freedom of beliefs (745 retweets)
- 2011 Biden visit in China, buy buns eat in a shop (47,099 retweets)
- 2012 Visa information updates (18,878 retweets)
- 2013 New Year greetings retweets (56,372 retweets)
- 2014 Attack at a Kunming train station (42,753 retweets) (http://weibo.com/usembassy)

The last two tweets have led to debates in China. The New Year greeting is "Gold snakes are dancing out the old year, and ten thousand horses are galloping to welcome the New Year! We wish

everyone a happy new year." If you see the comments below, you will find many comments are "repay immediately" which indicates China owns much US debt. The tweet in 2014 has incurred anger from the Chinese netizens, since it says attack in Kunming which left 29 dead and over 140 injured as a "horrible and totally meaningless act of violence" ("Legislators urge US" 2014). The netizens are angry about this; they rephrase the sentence by replacing the Kunming attack to Boston bombing in the United States to show their anger. The officials also criticize the United States using double standard on terrorism (ibid.).

## Conclusions

The relation between the rising power-China and the superpower - the United States is complex. On the one hand, they have different ideologies, political systems, and cultures. On the other hand, they are close cooperative partners in many fields. In this context, communication between these two counties becomes important and subtle. This research has studied the use of public diplomacy 2.0. It primarily answers the question of how the United States uses Weibo to do public diplomacy in China. It collected 5,974 tweets across 5 years from the Weibo of the US Embassy in China. It used content analysis to see the patterns. It also identified the top retweeted posts by the netizens. It found that American society, American politics, Sino-US relation, and Figures (people in America) are the main messages sent to Chinese publics. *American society* has the highest number of tweets. In the analysis, it found that the content of the tweets are the narrative of good things in America. Some tweets are very responsive and specific to what has happened in China. In describing how the United States dealt with such problems such as food problem and air pollution in the past and what America now looks like, it implicitly sends a message of a superior America. It formed a comparison with China. In the aspect of politics, it catches problems in the Chinese government and political systems such as a lack of transparency and corruption. By narrating the stories of the American government, political system, and their law and regulation, the Chinese government seems to be discredited. Meanwhile, it reinforces the American political value. Sino-US relation category is mainly about high-level exchange visit and communication activities. Tweets in Figures category portray a good image of President Obama; high officials have good virtues and women and disabled people have political rights, which have formed a contrast with those who have unequal rights and corrupted officials in China. To sum up, the US Embassy in China uses tweets to tell stories specific to what China lacks of and what problems are dissatisfying Chinese public. The pattern of the top 10 retweeted posts is similar to the one of the whole data. The four categories mentioned above are also the most retweeted themes. From this perspective, the agenda-setting seems successful. However, by examining most retweeted posts in the last 5 years, it finds that controversial tweets can lead to anger among netizens in China. In the case of China, the United States has to change its attitude when anger has spread and Chinese people and the government stand together. In addition, from the reaction of the netizens, it is not hard to see the rising power of China. Since the new Chinese government came into power in 2013, Chinese society has been inspired. The new government is tackling problems that concerned its public; in this case, it used by the US Embassy in China to build a good image of the United States and embarrass the Chinese government. The slogan of China Dream is helping China to gain soft power. This can partly explain why after 2013, the tweets about American politics and Sino-US relation are decreasing. It has a touch on a further research on how public diplomacy is done in the period of power transition and how it deals with the change when they have different ideologies, values, and political system.

# Governance and International Regimes

Paolo Magri
Italian Institute for International Political Studies (ISPI), Milan, Italy

## Definition

International regimes are classically defined as a set of principles, norms, rules, and decision-making procedures around which actor expectations converge in a given issue-area of international relations. International regimes emerge when states realize that, in the pursuit of their own national interests, some objectives are better achieved by, or may not be achieved without, cooperating with other countries.

In the 1990s, the concept further evolved towards that of "global governance". This concept postulates that the traditional predominance of nation-states in international affairs is increasingly challenged by a variety of non-state actors, and that the interactions between state and non-state actors, and among non-state actors themselves, give rise to a complex network of interdependences that may raise both the incentives for cooperation, and the chances of conflict and negative spillovers.

## From World Government to International Regimes

While the concept of "international regimes" only emerged in the late 1970s, at a very peculiar junction of the bipolar confrontation, its origins reach far deeper in the history and theory of international relations (IR).

IR theory was only formalized in the 1920s, but utopian thinkers had advocated for the creation of a world government for centuries. Such a government should serve the purpose to enforce global norms and maintain world peace. Recognizing the far-fetched nature of such an ideal, Immanuel Kant sided in favour of national governments self-regulating their own actions, outlawing secret diplomacy and standing armies (Kant 1795). Even in the face of the recurrent collapse of attempts at establishing "peaceful coexistence" (such as the Congress of Vienna in 1815), Kant's idealistic principles have resurfaced at the end of every major conflict of the XX Century.

In 1918, US President Woodrow Wilson outlined his Fourteen Points, calling for the end of secret diplomacy and a reduction in armaments. It spearheaded the creation of the League of Nations, an intergovernmental organization tasked with improving negotiations and coordination between world governments. However, the US ended up not joining the League, and the League itself could not prevent the emergence of nationalist and revanchist movements and parties in Europe, culminating in the Second World War. WWII brought a number of scholars to formalize what would come to be seen as the realist approach to international relations (Morgenthau 1948), maintaining that states, in their pursuit of power and the protection of national interest, are inevitably prone to conflict.

At the same time, WWII spurred the re-emergence of a tempered version of idealism – international liberalism – that tried to foster cooperation through the creation of a network of multilateral institutions. The victorious Allied Powers set the stage for a new international order, which hinged upon the United Nations for maintaining

peace and security, and on the Bretton Woods institutions (the World Bank and the International Monetary Fund, soon flanked by the General Agreement on Tariffs and Trade) for safeguarding international economic cooperation. This renewed attempt at regulating international coexistence among nations was short-lived as well, due to the onset of the Cold War. In just a few years the UN came to a standstill, while power politics was back in the driving seat. The Bretton Woods multilateral economic institutions continued to operate, but effectively only for the Western bloc.

As zero-sum realpolitik dominated relationships between the Western and Soviet bloc, realist scholars moved to structural explanations of international politics, shifting the blame from a pessimistic view of human nature to the anarchical state of the international system (Waltz 1979). Rational leaders that sought to maximize security for their own country inevitably fell prey to the logic of arms races, as no other competitor on the international stage could be trusted to keep its international commitments unless they matched its own national interests.

Meanwhile, *International Organization*, a journal founded in 1947 with the specific purpose to set the intellectual way for a new world of cooperation among nation-states, retrenched in rigorous scholarly work attempting to find narrow logical and empirical grounds for the possibility of peaceful coexistence in the international context. It was in this milieu that the concept of "international regimes" started to take shape (Krasner 1983; Keohane 1984). Neo-institutional scholars showed that, even when reduced to single states acting rationally in their own self-interest, in a number of occasions states cooperate with each other, choosing to be bound by international norms and to punish states that do not respect them (Bull 1977). Some international rules could prove "persistent", constraining activity and shaping expectations above and beyond what simple self-interest would dictate (Keohane 1989). These rules ranged from the development of international law regulating the actions allowed during war against soldiers and civilians (*jus in bello*), to the coordination of international economic policies via the Bretton Woods institutions, to the nuclear non-proliferation regime. In sum, international regimes were intervening variables, born out of nation's self-interest, that could then influence state behaviour, limiting the range of options available to governments without incurring in international condemnation, stigma, or even sanctions.

In the late 1970s and early 1980s, the Cold War threatened to become "hot" as the USSR invaded Afghanistan and US President Ronald Reagan fell back to the logic of arms races. Paradoxically, it was right around this time that events converged to show that international organizations retained a degree of effectiveness and legitimacy even at the height of the bipolar confrontation. From 1978 onwards, a number of recently-independent post-colonial states rebelled against the conditional policies imposed by the IMF when lending to countries in crisis. These countries chose to rely on the inflow of "petrodollars" made possible by high hydrocarbon prices after the 1973 oil shock. Borrowing at unsustainably high and volatile interest rates caused a series of major debt crises in the early-1980s, and eventually the IMF was called upon to intervene in Latin American and African countries to avoid or manage debt defaults. This political backlash allowed the IMF to attach even stricter conditionality to its lending. At around the same time, the World Bank increased its lending and granting activities to least developed countries to manage a sudden shortage of commodities, especially food during famines. And, a few years later, new specific international regimes started to emerge, such as the Montreal Protocol (1987) aiming to phase out the production of those substances responsible for ozone depletion.

This newfound importance of new and old international regimes was just the starter for a broader trend, which was only waiting for the Iron Curtain to come down to become a properly global phenomenon.

## The 1990s: From International Regimes to Global Governance

With the end of the Cold War, "international regimes" boomed, but the term was rapidly losing

ground as the concept of "global governance" emerged. This conceptual shift signalled a move from a focus on narrow, specific sectors in which international cooperation between nation-staes was deemed feasible, to an overarching and universal "way of managing" international cooperation, expanding the number of issues and actors. The UN itself heralded this change, establishing in 1992 the Commission on Global Governance, which in 1995 issued a seminal report, *Our Global Neighborhood*. Above all, the report stated that global governance was "the sum of the many ways individuals and institutions, public and private, manage their common affairs" (Commission on Global Governance 1995).

Four factors help explain the shift from international regimes to global governance. First, the collapse of the Soviet Union left only one superpower dominating the world stage. The US had invested heavily in the existing international regimes, especially in multilateral economic institutions, and therefore had a specific interest in supporting and bolstering them.

Second, societal changes in advanced economies – higher living standards and workforce specialization – allowed the middle class, scientific communities, and political elites to become increasingly aware of problems that needed to be tackled at the global level, such as climate change, environmental degradation, poverty and hunger, and human rights violations.

Third, the collapse of the Soviet bloc enabled many countries to access world markets, while trade was increasingly liberalized. In 1995, GATT was upgraded from simple treaty to a formalized international organization, i.e. the World Trade Organization. As globalization took off, increasing economic interdependence, coupled with the Asian economic crisis of the late 1990s and the 2001 global recession originated from the US dot-com bubble, showed that no country could consider itself as completely insulated from developments in the wider global economy. Bearing this in mind, countries entered in an increasing number of international agreements. The number of international governmental organizations (IGOs) almost doubled between 1989 and 2009 (UIA 2015).

Fourth, and most important, national diplomacies and ministries were increasingly eager to recognize the role of non-state actors on the global stage, starting from multinational corporations (including financial corporations managing huge capital flows able to destabilise countries), non-governmental organizations (NGOs), the scientific community, civil society representatives, and even individual figures (such as rich donors). Non-state actors had a more and more important role in shaping policies, setting standards, and monitoring their enforcement (Miller and Rose 1990). They were also important in order to legitimize agreements reached at the level of national governments (Scholte 2002).

The expansion of formal and less formal international organizations and *fora* (such as the G7, an annual summit of rich advanced economies), together with the newfound role for non-state actors, connected with the debate on globalization and its critics. This brought about a polarization in the debate on international regimes and global governance: for some scholars, these concepts acquired a very positive, almost utopic meaning; for others, they became synonym for everything that was wrong with globalization.

In the positive sense, "global governance" could be intended as a neutral ground in which even non-state actors could shape national agendas, influence policies, and monitor outcomes for global public goods. One example for this is the global governance of environmental policies, ushered in by the 1992 Earth Summit in Rio de Janeiro, which saw countries finding common grounds on a set of targets for reducing carbon emissions with the support of research from the scientific community (Young 1999).

Outside policy circles, Rosenau (1995) conceived of "global governance" as a structural change in the way in which nations and international relations were governed: as societies were becoming more complex, it was inevitable that the state left the stage for new non-state actors, and a looser, deeper network of self-coordinating groups. Around the same time, David Held (1995) conceptualized global governance as a means to foster the expansion of democratic and cosmopolitan values, ushering in a new role for civil society.

On the contrary, those who saw globalization forces as a tool for big-power dominance contested that "global governance" and "international regimes" only implied "rule by a few, big actors", be they states or multinational corporations (Scholte 2002; Wilkinson and Hughes 2002). For Robert Cox and Timothy Sinclair (1996, eds.), globalization was bringing about the emergence of a "transnational managerial class" that furthered the development and implementation of neoliberal economic and social policies. The rising trend of civil society movements contesting globalization and the role of the ruling classes exploded at the 2001 G8 protests, and reached its apex at the 2007 Atlanta Social Forum.

During the early 2000s, debate around global governance was therefore subsumed within the debate for or against globalization, and the term – that thrived when used as implying the possibility for international coordination and peaceful coexistence – appeared to be in decline.

## Today and Tomorrow: International Regimes and Global Governance in a Multipolar World?

Over the past decade, a new boost to the concept of global governance has come from two of the biggest crises affecting the "Western liberal order," which had supported multilateral institutions beforehand: the Great Financial Crisis (GFC) and the rise of new powers on the world stage.

The GFC brought the world to the brink of the greatest economic depression since 1929, persuading countries to address this global threat together. Meanwhile, a decadal shift in the international economic balance of power did not bestow to advanced economies the necessary credibility and firepower to tackle the crisis alone. At end-2008, the Group of 20 (G20), including G7 countries plus a number of major emerging economies representing most world regions, was upgraded to a summit at the level of Heads of State and Government.

Successful action by the G20 in avoiding the worst consequences of the global recession – mainly by committing to and enacting monetary and fiscal stimulus policies – was hailed by policymaking circles and academia alike as the symbol of the rise of a more inclusive, more effective mechanism for global governance.

The crisis brought about a number of explicit and subtle changes to the concept of global governance, and at the same time exposed a number of new, serious hurdles to its functioning and effectiveness. Compared to the 1990s, one of the main changes was the newfound centrality of state actors, both in diplomacy and power politics. States regained prominence not only in the annual G20 summits from 2008 onwards, as national governments representing about 80% of the world GDP convened to decide how to coordinate a host of national policies, but also in the central role national diplomacies played to reach the consensus of the 2015 Paris Agreement on climate change.

Overall, this change appeared to mark a deeper shift in the way global governance is conceived, moving from an idealized cosmopolitan community of policy actors to a more pragmatic view in which the functioning of global governance is affected by the international balance of power, relegating non-state actors to a secondary – albeit still crucial, especially in the most technical matters – role. This view was bolstered by the fact that, initially, pragmatism brought results. However, as time passed and the economic crisis subsided, such a flexible approach focused on nation-states appears to have reached its limits, essentially for three reasons.

First, as the G20 group moved from crisis fighting to the management of global problems in ordinary situations, a large number of issues crept on its agenda. As a consequence, the overall efficiency and effectiveness of the Summit declined markedly (Smith 2011). Second, as crises receded, differences between national governments started to resurface. Thus, global governance *fora* experienced increasing difficulties in coordinating action, pointing to common

solutions, or at times even in singling out specific global public goods to be safeguarded, such as economic growth, financial stability, or economic sustainability (Henning and Walter 2016). Third, advanced economies, first and foremost the US, were slow to respond to the shift in the world's economic centre of gravity by reforming existing multilateral institutions, especially economic ones. For instance, shareholder quotas in the IMF, which translate into voting power, have been reformed three times since 2008 (even in the face of US Congress hostility), but still do not reflect the current economic power of some emerging economies such as China and India, while as a whole European Union countries remain the most overrepresented group. This has reignited attempts by emerging economies to coordinate through alternative *fora*, such as the BRICS summits between Brazil, Russia, India, China and South Africa, and to launch new multilateral institutions. In 2014, for instance, BRICS countries launched the New Development Bank, while at end-2015 China spearheaded the Asian Infrastructure Investment Bank.

The challenge for the future of global governance in this narrower, intergovernmental sense is whether new institutions will act as complements to, or substitutes for the current system. Were they to act as complements, this may even benefit – for instance – lending activities by the IMF or the WB. On the opposite, if ambitious emerging countries chose to rely on new institutions to launch an open challenge to the current system, the jury will still be out on whether global governance will be able to survive in its current form.

## Synonyms

Adaptive Governance; Contingency Approach; Knowledge Governance; Reflexive Governance

## Definition

Governance knowledge could be defined as the knowledge or experience required to manage resources (material, nonmaterial, and human) and actors within systems to enable people achieve their interests as well as objectives. Governance and knowledge both are the essential attributes of an effective governance process. It may entail political, social, economic, and administrative rules through which policy-making processes are planned and implemented.

## Introduction

Governmental institutions in developed and developing countries have been facing complex challenges regarding the diverse communities they govern. Different communities represent diverse interests within the larger sociopolitical context. There are certain principles which determine the role of governance and the mechanisms of knowledge that can sustain and strengthen it. Good governance can be conceptualized in accordance with the values by which social actors interact in a certain context of participation, rule of law, transparency of decision-making, coherence, and effectiveness. These principles lay the foundation for sustainable development and often involve negotiations for all members of the society as key actors in the governance process. In addition to participation, the knowledge systems of various stakeholders are invigorated into the governance process through roles in decision-making. But, the question largely relies on – how governance and knowledge mutually constitute each other in terms of the complex layers of governance at local, national, and transnational levels.

Generally, a governance mechanism entails some important dimensions to manage the process. Caluser and Salagean (2007) emphasize on some of the dimensions which are important: "technical dimension" consisting of the economic aspects of governance such as the transparency of government accounts, the effectiveness of public resource management, etc.; "social dimension" consisting of strengthening mechanisms to promote democratic institutions and tolerance throughout society; and "political dimension" consisting the legitimacy of the government, the political elements of government, and respect for human rights.

It has been realized that knowledge is very crucial in the governance process. Drawing from such concerns, a new area of research erupted in the form of "knowledge governance." This can be considered as an evolving concept which focuses on organizational coordination of knowledge processes of using, sharing, integrating, and creating knowledge in accordance with set objectives through governance initiatives (Pemsel et al. 2014). However, the degree and nature of knowledge governance varies across different countries and time, in accordance with the acquisition of knowledge and organizational behavior through environments such as academic disciplines and expert groups. But, it is important to recognize the distinction between action and knowledge which is often bounded into complication without clear-cut formations. Knowledge lies beyond the application of policies, culminating it in different systems of hierarchy, as there is no single method of conducting evidence for policy research.

Accordingly, governance and knowledge mutually overlap each other in effective planning

and implementation of projects, international and transnational politics. Collective action is impossible without agreement of some kind. For instance, the usage of information and communication technology in enabling "digital" mode of governance, during the COVID-19 pandemic, can serve as a living example of such integrations. Education, health, and policy actors effectively manifested knowledge tunnels in designing social security and social protection schemes, while negotiating collective and individual circulations of interest at global levels. So, knowledge acts as a critical resource in identifying solutions of certain issues and exploring the nature of knowledge from each individual in an information-rich environment of complex social realities. But the role of knowledge in governance is difficult to delineate as different models require different theoretical articulations and casual mechanisms, leading to conceptual difficulties in comparing the models. For instance, any welfare models might come into conflict with interest groups. People belonging to different professions might participate in decision-making and governance within various spaces.

Jane Jacobs (2005) considered that in the context of American cities and urbanization, people of a neighborhood often work in self-governance, as an integral unit of power and opinion. She cited an example where the proposal to dissect the Washington Square in Manhattan's Greenwich Village and the decision asserted in favor of highways were unanimously criticized by the urban residents on the one hand and favored by influential leaders on the other hand. The contribution of knowledge governance crucially performs in deciding the degree of inclusiveness, openness, and opaqueness in policy making and organizational activities. Inclusive knowledge-generation also reflects its own share of challenges. The illuminating diversity of knowledge and fragmentation in complex governance sheds lights on the distortions in appearances of things. The discussion on the identification of the problem cannot be solved merely by facts but by how actors observe and make a sense of deeper levels of disagreements. Consensus is also reached based on definition and interpretation of factual knowledge as facts should be validated. It is the generation of validation which is often ambiguous and lies at the discretion of various interest groups. Arwin Van Buuren (2009) analyses multiple processes of knowing in the process of governance and how different conflicts present challenges on the successful implementation of the collective action. The WOK (ways of knowing) is how "one interprets the elements in a policy space and makes sense of the relationships among them. It is a narrative or story that holds all the pieces together in a relatively coherent way. The elements include people, objects, ideas, and relationships among them" (Schneider and Ingram 2007, p. 2). So, the mechanisms of knowledge should not lead to the dispossession of marginalized groups or the powerless, from their basic access to services, but enhance moral and community regeneration.

## Perspectives

In a generic sense, governance is the shift of power which relates to the interdependence between various avenues, either governmental or nongovernmental, leading to the distribution of effective functionalities in the management of state-subjects and political machineries. It might acquire a normative concept in relation to transparency, accuracy, accountability, however, exposing the intricate complexities in the proliferation of knowledge – systems, cutting across several disciplinary frameworks. The sharing of knowledge plays a pivotal role in organizations, leading to the mutual exchange of individual tacit knowledge, which is not easy to express (Kogut and Zander 1992). There might be unsurmountable obstacles in the transfer of knowledge leading to knowledge governance. While several network connections stress on knowledge systems for competitive dynamics, international strategies, resource building, and

management needs, there might be agreements on comprehensive formulations and pluralism in terms of governance of human capital, working in governmental sectors and other organizations. Human capital organizations significantly added value to humans and their specialized skill set rather than physical asset. The boundaries of firms radically transform not only as firms disaggregate, but also as the boundaries of firms become problematic when the human capital dominates physical capital (Foss and Foss 2002). It is the knowledge sharing and generation that take into account the human capital while shaping the patterns of organizational routines, behavioral conditions, individual factors, and knowledge sharing performance. The interaction between individual cognition and driving forces necessitates the materialization of formal prescriptions and even self-governance. But the use-value of human capital in large organizations is not without contradictions. For instance, the multinational corporations employ large number of employees belonging to diverse nationalities and ethnicities but are caught between the institutional pressures to conform to the company norms and values, and the cultural and social influences of its local national environment (Westney 1993). So, the broader diffusion of markets and consumer culture led to the formation of human capital as an instrument of knowledge sharing and governing the nexus of decision-making in corporate houses.

Consequently, governance moved from unilateral strategic planning to meta-governance, enabling collaborative processes of governance. These decisions and validation of collaboration are often mapped through the capacity of organization, decided by the authority at various levels of "collaborative capacity." Collaborative or organizing capacity leads to the ability of the people and institutions to deal with collective problems, leading in turn to perceptions that are practice-oriented and foster actions. It emphasizes on how knowledge serves as a means of changing the world. It also aims to overcome the fragmented segmentalization of organization as the complex problems are no longer only solved by the government within the bureaucratic forms but also dispersed among actors in their own locations and capacities (Koppenjan and Klijn 2004). For instance, several voluntary organizations, such as health clubs, political clubs, and religious congregations, have enough capacity of changing the life processes of individuals who join it and establish the collective identity of the people entering into relationship with others on the basis of their commonality and work equations. These institutions can serve as creating functionalities for the people to effectively exercise certain forms of power with knowledge. But certain conflictive choices might appear within the threads of cohesiveness. Different actors might have to make a decision on who gets to express their opinions and in what contexts. It depends upon differential ways of knowing and upholding the values of being and discovering the nuances of everyday lived experiences within the complex coordination kinship, caste, class, ethnicity, etc. Even if fair play, equity, and reciprocity are important for facilitating an inclusive process of action, joint activities often delimit the ability of one to strategize their own demands. Actors frame and reframe their priorities through the framing process, which is an act of balancing consensus and institutional arrangements together and provides a mechanism for implementing diverse knowledge mechanisms and models for future collaboration. The dominant framework of knowledge can be dented for a more possible mechanism of locally situated knowledge.

Knowledge is complex, and several disciplinary backgrounds, such as sociology, organizational economics, organizational behavior, and cognitive psychology, entered into several debates on the theoretical formulations of categorizing knowledge governance and redefinition of it. It cannot be relegated to the dimension of philosophical treatises but can provide a variety of linkages, across the cross-disciplinary domains. Various management researchers led to renewing of old traditions either in

implementing schemes of knowledge in built environmental projects or academic scholarship, international strategies, and multistage collaboration of firms. But, policy-making is often made into contradictory outcomes through the stakes of academicians, government officials, and workers from international organizations, working through conferences, seminars, and colloquiums. Drawing the concerns of academicians' contribution in policy agendas, Turner considered the marginal position of sociology in important policy decisions. Sociology, as an academic discipline studying human organization, should have been the major player in public policies but is left "standing on the side-lines, while presidential historians, economists, political scientists, lawyers, and even psychologists engage the public and whisper in the ears of those who have the power to make decisions that affect the organization of society and, hence, people's lives" (Turner 2005, p. 27). This leads to an imperative consideration that the transfer of knowledge is also influenced by the designs of the organizations and the multilevel governmental structures, placing it within the influential power hierarchies. The structures of domination and subordination within systems of knowledge accumulation are often generated through the units holding the means of economic and social production.

Knowledge governance has also been effectively utilized by the institutions which act as a basic mechanism of social, political, and cultural development across variegated actors, producing experiential frameworks of thought and practices. Research institutions facilitate opportunities for knowledge governance where innovations, modes of network processes, and peer-group researches brought significant transformations over the centuries. While in the pre-globalization era, epistemologies were concretized through the interactions between professors and students, the process of writing also added value on the process of knowledge dissemination. But, with the advent of digital technologies, the governance of knowledge constituted a complex mechanism, operating through the global transactions of knowledge across strong and wider research communities. It is quite apparent that the nodes of Internet are revolutionizing the spaces of work and life and obscuring the visionary domain of professional and private circles. John Wilbanks and Carolina Rossini (2009) considered how knowledge governance in the contemporary and traditional systems complement each other, potentially distributing knowledge as a public good across and beyond boundaries and limited spheres. While following the transformations chronologically, they stated that the "modern governance of knowledge in institutions covers a complex ecosystem of government, funders, universities, professors, students, textbooks, network – accessed content, software, research tools, research methods, and more" (Wilbanks and Rossini 2009, p. 3).

Articles, books, and theses, as a recognized unit of knowledge, have been preserved without significant changes, coexisting with the ability of digital networks to facilitate rapid and widespread knowledge structures such as online library systems. For instance, SWAYAM is an initiative by the Government of India enabling learners a lifelong learning through Massive Open Online Courses (MOOC). It provides learners an opportunity to choose from hundreds of courses from high school to PG level including skill-based training facilities. The governance of knowledge through digital repertories often engages people from wider networks, leading to the emergence of knowledge eco-systems and self-governance of each and every individual within their specific roles, rights, and responsibilities. Large indexing companies often serve as a generator and buyer of knowledge, subjected to policy mandates, terms, and agreement. They facilitate the research community through new discoveries, paper contributions, and research strategies. It is the strategic role played by large information companies which attempted to leverage knowledge in order to enhance performativity.

Knowledge management system is also dependent upon organizational cultures, enhancing the performance management of employees as well as

the larger exchange community. The leaders within organizations influence the organizational culture through their attitudes, management, and professional attitude, while also fostering positive climate and task achievement (Zyngier et al. 2016). The Information Technology is seen as an important discourse in enhancing the capacity of organizations to leverage knowledge. It led to the fast transfer and efficient reuse of knowledge. The role of IT has undergone a vast set of transformations over the course of developmental stages in generations such as the first-, second-, third-, and fourth-generation innovations simultaneously. The specialized process of coding and decoding information facilitated better access to knowledge and developed social capital to enable organizational learning across communities of practice. The communities of practice (COP) can be actualized for describing "a group of people naturally created inside an organization oriented towards sharing experiences about professional expertise (tacit and explicit) as a 'knowledge space' developing a process about 'training in working' (Orr 1990) or 'cognition in practice'" (Lave 1987). The technological platforms require a set of objectives to work to measure the impact of businesses, which is not only based upon resources but also the organization of human factors. Even "supplier evaluation," according to Olga Rivera Herna′ez and Eduardo Bueno Campos, is an important component of community of practice, where "a common certified supplier's database allows saves in the evaluation process, avoiding an evaluation per plant ... complemented by technological functions to control certification deadlines, cross-section analysis, supplier incident reports, etc." (Herna'ez and Campos 2011, p. 26). COP is mostly influential in creating formal evaluations, internally as well as externally as an important role lies in the retention of knowledge for the next generations. Most of the knowledge systems are susceptible to lose their value over the course of new advancements. So strong communities of practice can ensure stability of an organization through knowledge governance. They share knowledge among themselves which enables them to learn the work patterns of the others. So it is a bridge between working and learning, which circulates simultaneously across different workers working at different levels to obtain innovations. The flow of knowledge is also dependent upon the social environment which facilitates positive stimulus among workers. This can be referred through Albert Bandura's social learning theory, which is based on the idea that one learns from the interaction with others in a social context, as after observing the behavior of others, people assimilate and imitate that behavior if the observational experiences are positive ones and include rewards, leading to cognitive learning, retaining memory, and motivation (Nabavi 2012).

Consequently, strategic approaches to business management follow the basic principle of what can be posited as observation, learning, and sharing. In a more broad light, these processes can be explicated through the third-generation knowledge management, which encapsulates organically embedded systems, with applications such as business platforms, networks of actors, and technical systems devolving into social entrepreneurship. For instance, as per the report titled "The Future of Commerce in India," the social commercial sector in India ranges from $1.5 to $2 billion gross merchandise value (GMV) market. The growth of these markets has been facilitated through the conversational commerce on chat-platforms to video-commerce and social reseller community (Sheth 2020). So knowledge governance has been realized for its strategic benefits, as it helps to strike the right balance between people, process, and technology, and resulted in the standardization of operations for better collaboration and corporate governance along social ethics.

## Knowledge Governance: Challenges and Prospects

Knowledge functioned as the bedrock of governance across various historical trajectories of revolutions, changes, and resistance. It appeared as the major component and tool for struggles and enabled marginalized communities to portray their narratives through different forms of objective and subjective disbursal of realities. In the years following World War II, the policy sciences

reiterated the need for sciences and expertise within the field to discover facts, and make observations and judgments to implement new methodologies and principles of technical knowledge. This can be argued with reference to the work of several international organizations such as the World Bank, which funded projects for preservation and acceleration of knowledge across developed and developing economies. It served as the largest development research institute in the world (Gilbert and Vines 2000). President Wolfensohn stated that the World Bank embarked on a new vision in 1996 to become the knowledge bank that spurs knowledge revolution in developing countries and acted as a global catalyst for creating and sharing the cutting-edge knowledge necessary for poverty reduction and economic development (World Bank 2001). The dissemination of knowledge was mostly concentrated on the basis of developmentalist paradigm but acted as a global knowledge paradigm governing the social, political, and economic issues across national and local governments. The disciplinary policy actions from organizations such as the World Bank, International Monetary Fund, UNICEF, UNESCO, etc., made it possible for different stakeholders in civic institutions to obtain upgraded data on how a specific system is functioning and dimensionally integrating governance mechanisms with the protection of rights, public health systems, education, and even elementary well-being. These functionalities strengthened the rhetoric of knowledge governance.

Notwithstanding the relevance of nonlinear and linear forms of governance models, governance is a challenging process lying across the significant linkages between governmental decision-making and conflicts, often represented through political instabilities, violence, authority, and lack of stability. The dynamics of such conflicts and rules of sovereign power massively transformed with the transnational political economy of responsibilities and negotiations in relations of trade and market integration. While knowledge governance is considered as an economic activity, it is also a measure of well-being in social development indicators. Strong and effective governance is important for economic activity, enhancing the capabilities of global market mechanisms in developed and developing nations. The elements of governance, physical, human, and social capital, become intrinsically inter-linked through institutional qualities. These estimations can be realized with reference to M.H. Khan's (2007) work on "Governance, economic growth and development since 1960s." He states that liberal economists tend to think of governance as market-enhancing capabilities that reduce transaction costs and enable markets to work more efficiently, whereas economists following heterodox governance have the capacity to overcome entrenched market failures. Such forms of governance are linked to the economic growth of the nation in enhancing productivity, but Khan considered the knowledge mechanisms and subsequent governance are unequally processed in developed and developing countries. But, the suitability of the local context makes certain modes of governance adaptable. Governance is not related to being universal but has heterogeneous modes of operations across diverse sociopolitical contexts that shape the fabric of administrative ideologies.

It may be quite evident that, through governance, citizens are generally concerned with the government's responsiveness to the needs and protection of their rights. Good governance pertains to the management of public issues and problems while involving the intensive participation of citizens themselves. For instance, environmental movements and land-use planning characterize the involvement of the "public" in increasing the effectiveness of the planning process and legitimation of taking the decision on what is imperative for one. While planning has always been extolled on the basis of an instrumentalist parameter, scholars from various folds of academic scholarship stressed the need for a more humanistic perspective in institutional conduct. There is a need for different kinds of participation and organization, inviting issues and concentration on the local context. The larger question which arises is – how citizens are to be represented and involved in varying situations and how consensus-creating signifiers can be achieved in the backdrop of multivariegated

locations of the knower? Communities of interests and practices might be based on the individuals within organizations, professional communities, who share practices and even consequences. It refers to constellations involving standardized norms. Wenger identifies that "when a social configuration is viewed as a constellation rather than a community of practice, the sustaining of constellation must be maintained in terms of interactions among practices involving boundary processes" (Wenger 1998). Members of the community become full participants engaging as mediators between different communities of practice. Their role involves the tensions between agency and opposition of interests.

Management practices can be considered as an effective practice, where varying groups are involved in the complex process of production and consumption of knowledge, acquiring multiple memberships. In mutual engagements, business schools and managements led to the diffusion of new management knowledge, supplying education, MBAs, DDAs, practitioners, etc., for the maintenance of professional associations. Language, styles, and performance techniques disseminate systems of surveillance in organizations, forming different contexts for knowledge governance across interested communities with specific goals. The business media interacts and forms partnerships across other organizations, for drawing information on designing strategies and integrating packages for sale and profits. For instance, several business enterprises enter into partnerships with advertising agencies for the marketization of their products. Advertisements produces a vital visual medium of knowledge, integrating general masses with the products of opinion and choices. Competitiveness of managers, consultants, and business schools further provides more impetus to the process of management knowledge. Building a knowledge system can lead to decreasing cost of support, increasing consumer happiness, and improving overall customer experience and success. Providing these resources can help the customers to spend more time on high leverage activities and help people utilize knowledge to achieve better tasks. For instance, the mew mechanism of product grading enables the consumer to receive benefits of offers and enhance their level of satisfaction. The benefit of knowledge management systems lies in the way in which best practices are available to the customers. Even chats with customer support agents can lead to a way of knowledge transmission, integrating opinions and choices along the systems of product consumption. Even membership cards of popular brands and the small-scale knowledge on product utilization lead to a better consuming experience and increase the popularity of the brand by allotting discounts for the consumers. So, the knowledge management systems include characteristics such as commercialization, market modeling, privatization, training programs, structural modeling, etc.

Drawing from such forces of market management, knowledge governance can be supplemented across micro- and macrolevels, individual and collective dimensions, respectively, focusing not only on the generation of tools but also attitudes and motivations at the workplace or organizations sustaining such forms of governance. The differential elements achieve competitive positioning in the market, which received a large impetus with the emergence of globalization. The spaces of participation can be organized beyond geographical considerations, forming incentives and protocols of secured relationships with others. Globalization induces discussions on the corporate governance models resulting in dispersed ownership, strong legal protection of stakeholders, freedom to merge businesses, etc. It ensures possibilities of stability on the one hand, while on the other hand posing formidable challenges for the communities with poor incentives. The pressure of standardization often marginalizes groups with diachronic forms of arrangements and legal protocols. For instance, with the privatization policies in India in the 1990s, several small and petty businesses lost their ray of hope to large brands, which brought with them use as well as status values. The LPG (liberalization, privatization, and globalization) model of development led to significant sources of generation for employment, creating avenues for financial and technical support. So, globalization processes led to a worldwide network of multilateral organizations producing efficient

governance standards, along with taking into account the historical, cultural, and political organizations.

## Conclusion

In the age of competitiveness and complexities of organizations, knowledge governance remains an essential process consisting of several elements at disposal ranging from the community of practices, shared knowledge, policy spaces, work culture, management practices, etc. It enables the participation of different stakeholders in unique elements while developing insights for stability and dynamicity of boundary experiences. The potentiality of conflictive processes always remains through certain "ways of doing" in maximizing fruitful cooperation and synergy, mobilizing content, managing a collaborative governance process, and facilitating interaction. So knowledge and governance form an exclusive combination in fostering relationships between actors in the process of dissemination and creation of knowledge, while championing the connections across human resources and the larger structures of administration and technological disciplines.

## Introduction

Governance and leadership are essential in public life and, accordingly, are very worthy of practical and scholarly attention. Their efficacy must be a matter of considerable public interest. They complement one another, while also being interdependent. This is so irrespective of their types or modes, which are diverse within and across countries and political systems.

Governance and leadership are, and have always been, fundamentally about goal-oriented alignments of people, structures, processes, resources, and place (Gulick 1937; Simon 1946; Peters 2010, pp. 139–154). Such alignments, which are usually even more diverse than the governance and leadership around which they are configured, inevitably involve forms of organization as instruments of public action. Consequently, and significantly, most types of governance and leadership are both organizationally founded and organizationally dependent, with organizations as instruments concomitantly being means, centers, and results of governance and leadership as purposeful constructs and endeavors (Thynne 2015, 2016).

## Governance and Organizations

Very broadly, governance comprises "the totality of interactions" (Kooiman 2003, p. 4) of the state, market, and civil society as interrelated sectors of activity. Its multidimensional organizational bases embody various patterns of integration and autonomy, coordination and specialization, and accountability and control (Thynne and Peters 2015, pp. 77–79; Thynne 2017). The patterns are shaped and conditioned by a multitude of people, legal foundations, relationships, decision-making, and spatial considerations, which become intermingled in practice as organizations crosscut sectoral boundaries. As such, they involve a "shifting mix of deliberate design and adaptive behaviour" inherent in the duality of organizations as "deliberately created and reformed in order to achieve substantive ends" and "social organisms that evolve over time as an unplanned result of historical processes" (Olsen 2010, pp. 18–19). A consequential task is to understand and interconnect differing legal prescriptions, structures, norms, decision approaches, and delineations of people and place to maximize goal achievement in the public interest (Thynne 2015, p. 268).

More specific notions of governance include "the minimal state; corporate governance; the new public management; 'good governance'; socio-cybernetic systems; and self-organizing networks" (Rhodes 1996, pp. 652–659). All have organizational dimensions, with actual or potential mixes of intra- and interorganizational arrangements that can heighten tensions especially of integration, autonomy, accountability, and control. They can exist alone or be intertwined in the one organizational arena. In their differing guises, they are examples of, and testimony to, the scope and breadth of governance in theory and practice (Grindle 2016; Osborne 2010).

Associated conceptions of governance are manifest in interrelated approaches to how public action can be organized. The approaches are "statism," "state-market dualism," and "state-market-civil society synergism" (Thynne and Peters 2015). They, too, have significant organizational bases, with distinctive features, as well as existing alongside and often complementing one another in various arenas. This gives them a mutually supportive quality in collectively embracing all

forms of action involved in the design, delivery, and review of policies, programs, and projects concerning goods and services of public significance.

Statism is classic "interventionist governance" (Knill and Tosun 2012, p. 210), with the state owning, producing, providing, regulating, and facilitating a wide array of goods and services. It accords with the "welfare state" (Wilensky 1975), "administrative state" (Waldo 1948), and "developmental state" (Johnson 1982). Hierarchy involving command and control is its dominant mode of governance (Pierre and Peters 2000, pp. 15–18). This mode is used comprehensively and extensively as the state serves society and manages the economy, as enabled and shaped by a large body of law (Thynne and Peters 2015, pp. 79–80).

State-market dualism, largely as "regulated self-governance" (Knill and Tosun 2012, pp. 210–211), recognizes the value of strategic alignments of the state and the market in serving a society and managing an economy. It embraces the "regulatory state" (Majone 1999; Oliver et al. 2010) and the "state under contract" (Boston 1995). Command and control continue to be significant but are relaxed and complemented by contracts based on exchange as a market mode of governance (Pierre and Peters 2000, pp. 18–19). The aim is to maximize the relevant, interconnected attributes of the state and market in relation to the ownership, production, provision, and regulation of many goods and services in the public interest (Thynne and Peters 2015, p. 80).

State-market-civil society synergism, essentially as "cooperative governance" (Knill and Tosun 2012, p. 211), sees inter-sectoral alliances and conflation as keys to the effective provision, regulation, and facilitation of various goods and services of public importance. It is variously "interactive" (Torfing et al. 2012), "collaborative" (Emerson et al. 2011), "constellational" (Thynne and Massey 2013), and "holistic" (Perri et al. 2002). Accordingly, with networks as its main mode of governance (Pierre and Peters 2000, pp. 19–20), the expectation is that knowledge, skills, and related resources will be effectively dovetailed and shared in the pursuit of common goals, as supported where relevant by contractual exchanges and flexible means of command and control (Thynne and Peters 2015, p. 81).

The approaches to organizing public action involving differing modes of governance have distinctive state-based organizational arrangements: see Table 1. Organizations in statism and state-market dualism are distinguishable largely by their legal-structural foundations, while those in state-market-civil society synergism are distinctive in having significant capacities which need to be developed and applied whatever their

**Governance and Leadership, Table 1** Approaches, organizations, and roles. (Source: Thynne and Peters (2015, p. 82))

| Approaches | Distinctive organizations | Main roles |
|---|---|---|
| Statism | Ministries and departments | Policy advice provision |
| | | Social service provision |
| | | Social and economic regulation/facilitation |
| | Statutory corporations | Public utility ownership/production/provision |
| | Review and audit bodies | Administrative and financial regulation/facilitation |
| State-market dualism | Executive agencies | Social service provision |
| | Government companies | Public utility ownership/production/provision |
| | Regulatory authorities | Public utility, social, and economic regulation/facilitation |
| State-market-civil society synergism | Service collaborators | Social service provision |
| | Network synthesizers | Social service provision |
| | | Social and economic regulation/facilitation |
| | Instinctive adaptors | Social service provision |
| | | Social and economic regulation/facilitation |

foundations, roles, and commitments. This makes the latter more structurally variable and potentially more operationally dynamic in how they address the provision, regulation, and facilitation of goods and services (Thynne and Peters 2015, p. 82).

Where hierarchy-command and contract-exchange are the prominent modes of governance, as they are in statism and state-market dualism, respectively, the organizations differ in their levels of integration, autonomy, coordination, specialization, accountability, and control. The differences are reflected in the organizations which characterize the approaches, as depicted in Table 1. Not surprisingly, there are important variations within and across the approaches in response particularly to the roles being performed. At the same time, the arrangements are sufficiently distinctive to confirm the extent to which modes of governance and forms of organization are normally quite closely aligned in practice.

Issues of alignment and associated levels of integration, autonomy, coordination, specialization, accountability, and control are also applicable to the network mode of governance which underpins organizations and their relationships in state-market-civil society synergism. The mode includes a "self-governed network," a "lead organization network," and a network with a "network administrative organization" (Popp et al. 2014, p. 38). Each represents a specific form of organizational coordination in a network, with corresponding levels of autonomy, integration, accountability, and control. Thus, a self-governing network involves all organizations in it together coordinating with one another; a network with a lead organization sees one of the organizations in it being the endorsed coordinator; while a network with an administrative structure has an organization at its center or above it with formally prescribed coordinative responsibility. Such arrangements are influenced significantly by the capacities, obligations, and resources of the organizations involved, with important implications for the efficacy with which the organizations in the network interact with one another and achieve their individual and collective objectives (Popp et al. 2014, pp. 37–40; Thynne 2017).

## Leadership and Organizations

Whatever the modes of governance and forms of organization, governance and leadership have continually to cope with the needs and dynamics of continuity and change. Strategies, policies, and processes should coalesce organizationally around what has proven over time to be effective and worthy of retention and what requires adjustment, more substantial transformation, or complete replacement. This invokes a mix of "exploitation" and "exploration" in which making the most of "rules, routines, and knowledge that are known to work" is coupled with "a willingness and an ability to experiment with rules, routines, and knowledge that might, but often do not, provide improvements" (Olsen 2010, p. 21). The astuteness and subtlety of the mix affect the extent to which the needs of continuity and change are effectively blended and met.

Various types of leadership and leaders are possible in governance. For example, identified "organizational leadership in the public sector rather than political or policy-making leadership" entails "leading for results," "leading followers," "leading organizations," "leading systems," and "leading with values" (Van Wart 2013, pp. 553, 555). The leaders involved, as cast, in "classical management and role theory," "transactional leadership theory," "transformational leadership theory," "horizontal or collaborative leadership theory," and "ethical and critical leadership theory," respectively, face corresponding challenges concerning administrative and financial performance, people and their responses to management, technological and structural imperatives, collective action and cooperation, and ethics and public trust (Van Wart 2013). Such challenges, while individually significant, combine to highlight the considerable extent and importance of what has to be addressed and achieved by leaders across the

approaches to organizing public action through the adoption of modes of governance and forms of organization.

Similar and other challenges are seen as requiring "political, administrative, and citizen leadership" with "competencies which governments need in order to cope with volatile environments" in an increasingly complex and ever-changing world of governance and organizations (Bouckaert 2010, p. 51). Especially challenging are the demands of securing public legitimacy and trust and of strategically fostering policy and service integration through a diversity of interrelated structures and alliances in local, national, and international arenas. Essential competencies are foresight, vision, and an ability to facilitate appropriate change and reform (Bouckaert 2010).

Perspectives on change and reform in governance embrace leaders and leadership in the design, use and evaluation of organizations, other instruments, and action. Possibilities include "architects" and "builders" (Thynne 2010, pp. 71–72), who align, respectively, with the architecture and construction approaches outlined in Table 2. Accordingly, architects address deciding, taking, and reviewing as interrelated but separate phases of activity which need to be managed sequentially. By contrast, builders respond to deciding, taking, and reviewing as intertwined phenomena to be managed as an iterative process of creation, assessment, and adjustment. Of course, the differences are abstractions, with inevitable overlaps and interdependencies in practice. But they do highlight how leaders can variously respond to the design, use and evaluation of organizations, other instruments, and action in governance (Thynne 2016, p. 67).

All leaders, irrespective of their particular dispositions in governance and organizations, are bound by stringent integrity requirements. Integrity, as "a quality of individuals as well as of organizations," entails performance "in accordance with relevant moral values, norms, and rules" (Lasthuizen et al. 2011, p. 387). It demands internal self-discipline and right practice, coupled with external control and review (Huberts et al. 2008; Lawton et al. 2016). Its essential publicness has to be complemented by accountability, which "involves establishing facts and assigning causality and responsibility, formulating and applying normative standards for assessing conduct and reasons given, and building and applying capabilities for sanctioning inappropriate conduct" (Olsen 2015, p. 425). This supports the question "does public accountability work" frequently being revisited from "democratic," "constitutional," and "learning" perspectives alike, with their respective concentrations on "control by citizens' elected representatives," "prevention of corruption and abuse of power," and "enhancing government effectiveness" (Bovens et al. 2008, pp. 225, 230–232).

**Governance and Leadership, Table 2** Contrasting approaches to deciding, taking, and reviewing. (Source: adapted from Thynne (2016, p. 68))

| Phases | Architecture approach | Construction approach |
|---|---|---|
| Deciding on organizations, other instruments, and action | Blueprint deciding: organizations, other instruments, and action are decided on independently of taking and reviewing | Pilot deciding: organizations, other instruments, and action are decided on by trialing taking and reviewing |
| Taking action through/ by using organizations and other instruments | Sanctity taking: organizations, other instruments, and action must accord fully with the blueprint | Adjustable taking: organizations, other instruments, and action can be modified in response to relevant circumstances |
| Reviewing organizations, other instruments, and action | Summative reviewing: organizations, other instruments, and action are reviewed only when considerable experience has been gained | Formative reviewing: organizations, other instruments, and action are reviewed on a regular ongoing basis |

## Concluding Comment

Governance and leadership matter greatly for, and well beyond, reasons embedded in this discussion. Organizations are a common foundation, with significant consequences for the scope and efficacy of public action. The alignments involved are complex and diverse, in respect of which comprehensive thinking, research, and analysis remain essential, building on the very extensive literature already available. This applies alike to governance and leadership through organizations and to how organizations themselves are governed and led in public life.

## Synonyms

Adaptive leadership; Followers; Leaders; Motivation; Social leadership

## Definition

Leadership is a process in which leader and followers interact in a way that enables the leader to influence the actions of the followers in a non-coercive way, toward the achievement of certain aims or objectives (Rollinson and Broadfield 2002).

## Introduction

Research on leadership focuses in the activity in which followers consent to a leader exercising influence with a view to achieving something. Also, one leader's influence cannot be coercive; at the same time, subordinates must accept to be influenced. A wonderful leadership is a significant factor to a victorious group or a successful organization and even to a flourishing nation. Leaders usually have the powerful influence on the performances and behaviors to members of organizations. It's distinguished to naked use of power. There are rising interests on leadership in recently two or three decades. It is worth to note that Pettinger (2002) has emphasized the importance of leadership in integrating motivation in the working process. Similarly, Jones and George (2003) were proponents of the idea that motivation from leaders can be defined as, according to its nature, psychological forces which influence and even determine the direction of people's behavior in organizations.

The purpose of this entry is to provide a common overview of what is under the debate of the role that leadership acts in the process of governing process. This begins with the theoretical perspectives that focus on the understanding of adaptive leadership and social leadership. Then, the second part of this entry is to identify the leadership in public organization. Finally, it concludes the perspective on Leadership and Governance.

## Theoretical Perspectives

Difference management is usually regarded as getting things done through subordinates to achieve the goals of organization. The manager may react to specific situations and be more concerned with solving short-term problems. Leadership doesn't necessarily take place within the hierarchical structure of the organization. A leader often has sufficient influence to bring about longer-term changes in people's attitudes and to make change more acceptable (Mullins 1996). Leadership can be seen primarily as an inspirational process (Hunt 1992).

Managers and governors are concerned with doing things right: to master routines and maintain control so that they can achieve their assigned goals in the most efficient manner. Leaders, on the other hand, are more concerned with being effective: doing the right things to accomplish the organization's mission (Hunsaker 2001).

Both leaders and governors are all needed within organizations. If people want to be effective managers, it is necessary to cultivate the role of leadership. Many methods of management training can also be used as a means of measuring leadership style.

Supportive leadership involves leader behavior that shows concern for subordinates' well-being and personal needs. Leadership behavior is open, friendly, and approachable, and the leader creates a team climate and treats subordinates as equals, such as policy "fair treatment of employees" and "fair management without discrimination."

Directive leadership occurs when the leader tells subordinates exactly what they are supposed to do. Leadership behavior includes planning, making schedules, setting performance goals and behavior standards, and stressing adherence to

rules and regulations. Participative leadership means that the leader consults with his subordinates about decisions. Leader behavior includes asking for opinions and suggestions, encouraging participation in decision-making, and meeting with subordinates in their workplaces.

Achievement-oriented leadership occurs when the leader sets clear and challenging goals for subordinates. Leader behavior stresses high-quality performance and improvement over current performance. Achievement-oriented leaders also show confidence in subordinates and assist them in learning how to achieve high goals (Daft 1997).

## Leadership in Public Organization

Existing literature on adaptive leadership distinguishes between technical challenges (solved through the application of expertise and past experience and requiring no change in values or culture) and adaptive or wicked challenges (underlying dynamics which require a new evolutionary step in problem-solving processes) (Heifetz 1994; Rittel and Webber 1973; Grint 2005). Adaptive leadership theory has diagnostic strength in distinguishing between technical and adaptive issues. However, it has less strength in revealing the type of actions which can be taken to address adaptive challenges.

By 2000 it was estimated that there were around 35,000 definitions of leadership in academic literature (Dubrin 2000). Leadership research has traditionally been placed into three broad approaches (Heifetz 2004, pp. 16–17). Firstly, the trait approach, best known as the "heroic" or "big men" approach, focused on individual personality, talents, and skills. Secondly, the situationalist approach essentially attributes leadership to the extraordinary times in which events occurred, hence relying on the context in which leadership is exercised. Thirdly, the transaction approach based on reciprocity. This focuses on the interactions between leaders and followers based on expectations and influence.

Leaders' responsibilities are to increase followers' motivation and confidence to achieve personal goals and organizational targets. And now, we usually find: first of all, leaders carry out open communications with subordinates in order to make common goals or even particular targets together. Organizational goals are also individual missions. As a result, employees get the profile of annual assignment of the organization and direction of their work. According to individual characteristic and competence, managers allocate specific roles to them, encourage employees' creativities, develop their knowledge and professional skills, and build up confidence to face challenges. On the other hand, through the communications between leaders and followers, the former certainly get acquaintances about needs of the employee. Therefore, requirements are satisfied by leaders via establishment of comfortable work environment, carrying out generous benefits programs, labor management consultation, and formal system of promotion and appraising (House and Mitchell 1974).

Such approaches, especially the heroic notions of leadership, have been seriously questioned in the context of community development and collaboration where the nexus between leadership and agency was seen as inseparable (Raelin 2014, pp. 1–5). Moreover, the outcome of community collaborative practices began to challenge traditional leadership theories which consistently failed to make progress on difficult underlying issues (Chrislip and Larson 1994, pp. 15–36). In contrast, the theory of adaptive leadership provides greater clarity as to the practical diagnosis and potential actions in engaging a community.

Although "adaptive leadership" is a more recent term, parallels can be found throughout history. Adaptation as a concept spans many disciplines from Charles Darwin (1859) in his *On the Origin of Species* to Thomas Kuhn (1962) in *The Structure of Scientific Revolutions*. However, difficult contemporary adaptive problems were first labeled as "wicked" problems by Rittel and Webber (1973) and later expanded on by Grint (2005). Such problems could not be solved through the application of technical knowledge and expertise but required constant experimentation. This framing gave some further clarity to the nature of such challenges, but potential responses to wicked problems remained elusive.

A more formal theory of "adaptive leadership" was outlined by Heifetz and Sinder (1988) and extended by Heifetz (1994) in *Leadership Without Easy Answers*, basing it on the biological analogy – adapt or perish. While the term "wicked" was more descriptive of the problems, the term "adaptive" gives a better appreciation of how to approach such challenges (requiring a new evolutionary step in problem-solving processes). Adaptive challenges represent competing values in society (often expressed as tension and conflict) and require engaging different perspectives and questioning basic values and assumptions. In this context, leadership clarifies values by asking challenging "questions" rather than having "answers." Communities tend to avoid difficult questions, and the role of leadership is to engage that resistance through confronting problematic realities to promote learning.

Social leadership contributes to understanding how communities can engage in this adaptation. Placed in the context of social learning and action learning, social leadership helps reveal the critical local dynamics which act as obstacles but which can also mobilize people to action. This is important when communities are facing stressful periods in which social capital is strained. During periods of stress, leadership too often becomes reduced to an extension of "managerialism" – a focus on increased efficiency, performance management, mission statements, strategic planning methodologies, and ten-point plans and processes. This may lead to greater efficiency on limited tasks but does not improve the ability to engage people in facing difficult realities. In contrast, understanding the nature of adaptive or "background" challenges and dynamics at a local level gives clearer insight into potential paths for progress through collaboration. Social leadership becomes not a "tool" to apply but a way of engaging, exploring, and discovering these underlying dynamics which act as obstacles to progress. Additionally, it draws out the potential for reinforcing what is valuable in the cultural narrative and helping communities "let go" of practices which contradict their aspirations. Social leadership contributes to the study of adaptive leadership through four key perspectives:

1. Learning: Instead of framing social challenges as "problems," they are reframed as potential "learnings." That opens up new opportunities and allows communities to see the reality of threats and opportunities more clearly.
2. Sustaining purpose: Purpose needs to be dynamic and constantly unfolds as the environment changes, as values shift in the community and as new obstacles are encountered and overcome.
3. Localism: Local responses embed an understanding of the underlying dynamics and competing values at stake and the extent to which people are prepared to confront a new reality.
4. Collaboration: Instead of competing agendas, the focus shifts to the creative activity of adapting to new environments and discovering how competing values can be modified to make progress rather than avoiding tough conversations and just seeking sanctuary in a like-minded group.

## Parting Shot of Leadership and Governance

Social leadership does matter as a way of helping communities under stress work through some of their most difficult underlying issues. A social leadership approach puts emphasis on discovery, diversity, and local experience. This generates the necessary "learning" that needs to be orchestrated among competing values and interests through surfacing contradictory assumptions, beliefs, and values. This reframes issues and allows for continuing adaptation to a changing environment, as new obstacles are encountered and overcome. It is a dynamic approach which goes beyond strategy, process, and solutions to instead expand a community's problem-solving capacity. In practice, that means diagnosing a situation, building partnerships, crafting interventions as experiments, and monitoring a constantly changing environment. The key finding of this thesis is that social leadership contributes to a deeper understanding of underlying dynamics and increases communities' capacity to work difficult adaptive challenges.

A social leadership approach reveals underlying dynamics work at multiple levels. This means that if we can learn to address problems facing our local communities, we will be better able to progress them nationally and globally. Conversely, if our local communities cannot successfully deal with issues of poverty, inequality, injustice, violence, child abuse, alienated youth, and race relations, then we are unlikely to successfully deal with similar issues at a national or international level. If our communities are mired in conflict, discrimination, and an intensely individualistic approach that promotes a "them and us" attitude, then we should not be surprised when it flows through to conflict and "them and us" competition at the national or international level. Social leadership is required as a catalyst for the social learning required to progress these issues.

Exercising social leadership goes beyond being a bystander and instead engages people, communities, and nations around complex realities. Our responsibility to the future is to engage with the underlying problems we face today rather than just bequeath them to future generations. The trauma of people currently facing conflict, poverty, and inequality is passed on from generation to generation. The values which initially helped build a nation might actually retard its progress, as the environment changes and new threats and opportunities emerge. Simply allowing systems to replicate themselves will not provide an answer. Rather, social leadership requires that we intervene into systems, to make them more resilient and at the same time more responsive, not only to the challenges we currently face but also for those yet to arise.

# Governance and Network Formation Triggers

Karen Heard-Laureote
Faculty of Humanities and Social Sciences, School of Social, Historical and Literary Studies (SSHLS), University of Portsmouth, Portsmouth, UK

## Definition

Policy networks are formal and informal linkages between and among clusters of policy-makers and those who are in positions to influence.

## Introduction

Policy network has come to be used most often as an umbrella term to describe any network that works to influence policy. They can be described

as formal (i.e., institutionalized) and informal (i.e., ad hoc and/or noninstitutionalized) contacts or linkages between and among clusters of policy-makers and those who are in positions to influence, i.e., policy agents from the business community as well as from civil society. These contacts are structured around shared albeit continuously negotiated beliefs and interests, for example, in policy-making and implementation. They often bring together a range of scholars; experts, advocates, and professionals congregate around issues and concerns impacting society. Importantly, these actors have a shared assumption about the appropriate course of policy action.

Policy networks tend to emerge around specific policy issues and their in/formal interactions shape policy decisions and the directions taken by policy-makers.

In most cases, policy networks are primarily associated with modern, democratic and pluralistic political entities. They often replace or successfully compete with traditional notions of hierarchy or the neoconservative ideal of privatization as the main vehicles for shaping and delivering policy. Policy networks actually infer a kind of hybrid arrangement for policy-making in modern, democratic governance, where a range of actors are involved at all stages of policy from agenda setting to decision-making and implementation.

Policy network analysis is the field of research in political science developed to study policy networks. The field focuses on the links and interdependencies between policy-makers and societal actors, aiming to understand the policy-making process and public policy outcomes. In modern government, policy outcomes can be explained by investigating how networks are structured in a particular policy sector. Various taxonomies of policy networks exist and have been diversely used to describe or model patterns of state-interest group relations, i.e., corporatism and pluralism, iron triangles, subgovernment and clientelism, policy communities, and issue networks. The key differences between these differently labeled network arrangements lie in their degree of integration, the nature of state-interest group relations with in them, their boundaries (i.e., included and excluded actors), their membership size, and the distribution of resources in the network.

Policy networks are increasingly omnipresent in transnational systems like the EU and the USA and have also progressively coalesced around international organizations such as the UN, WTO, and IMF. They are a product of a wider and growing movement of "transnationalism," a term which broadly refers to the numerous and increasing ties and connections that link people and/or institutions across borders, be they national, regional, or local. This dynamic movement responds to the basic processes of globalization.

## State of the Art and Future Perspectives

### Network Formation

An interesting question pertaining to policy networks is why do they form? Despite the increasing prevalence of policy networks and their role in transnational political mobilization noted above, little is actually known about their formation. Investigations into the origins of networks are often hindered by limited access to the early, developmental stages of networks by researchers. Notwithstanding these hindrances in studying network formation, it is important that we do so given the substantial impact formation processes can have on future network structures as well as their effectiveness. Moreover, policy networks are continuously evolving and change activities, remit of action, and membership. Within this perpetual evolutionary process, the past is a primary shaper of new choices because policy networks develop in a path-dependent manner. As such, network formation will have an impact on their subsequent development and indeed their outcomes. It is during the formation process that network traits are established and which might turn out to be persistent as the network evolves. Thereafter, these network traits may affect their future effectiveness and success such as their ability to influence policy. The upfront, high costs of network formation also underline the importance of research into this area. The costs often include for example time, human, and financial investments associated

with instigating interactions among previously unlinked actors. As a return on any onerous up-front investment of time and resource, it is important to ensure that policy networks deliver policy impact. By developing understandings of how networks form, their participants, including policy officials, can engage in effective decision-making processes within the resulting networks.

In short, policy network formation is significant and understanding what initiates these phenomena and warrants further investigation. The key question is what spurs a group of otherwise autonomous actors and/or organizations to begin interacting with each other and to form a policy network? The discussion now turns to those triggers, which are important in understanding network formation and subsequent network evolution.

## Network Formation Triggers

Network formation and network evolution are contingent on (a) a mix of internal pressures in *and* between organizations and (b) on external pressures. As such, we can distinguish between (a) environmental and (b) organizational network formation triggers. Organizational triggers refer to the influence, incentives, and pressures of member organizations involved in the network building process, whereas environmental triggers refer to, for example, key external events such as policy changes that occur at the same time the network is established and becomes formalized. Although the key triggers of policy network formation have been disaggregated here into two distinct categories – organizational and environmental triggers – it is noteworthy that disaggregation is used as a heuristic device. Sometimes, triggers are both environmental and organizational in their nature.

### Environmental Triggers for Network Formation

Environmental triggers for network formation are those occurring outside the network and contributing to its formation and development. They are, for the most part, beyond the control of the network and its members. Despite occurring externally, these environmental triggers can have a significant influence on the activities and long-term sustainability of the resulting network because they determine the focus of the network's work (aims, objectives, mission) and the political agendas it may seek to respond to through advocacy, lobbying, or influence.

In terms of key environmental triggers, a policy network may be activated where certain conditions are present. For example, where there is a ripe external setting such as an active political culture, which promotes interest group involvement in politics. Political culture refers to the set of attitudes, beliefs, and sentiments, which give order and meaning to a political process and which provide the underlying assumptions and rules that govern behavior in the political system. It encompasses both the political ideals and the operating norms of a polity. A policy network may also emerge where there are formal institutional structures in place, such as clear regulations governing the policy field and its decision-making processes. Networks are also likely to develop in environments where there is a strong external coordinating function in the delivery of governmental programs by the emerging network. Where policy networks are involved in implementation, they are more likely to emerge where there are clear and definable programs requiring operationalization. In addition, and to reduce uncertainty and promote problem solving, networks will form more readily where all of the stakeholders responsible for implementation are included in decision-making discussions.

Three further key environmental triggers can be highly significant in activating policy networks. First is the release of new data on a given policy issue, which can provide a strong incentive for interested actors to coalesce in response. Second, policy networks can emerge more readily where there is a role-model example of network formation to emulate. This role-model network is likely to be considered more established or perceived as functioning in a highly effective manner. Third is the existence of (a) competitor network(s). The emergence of a new network – which is perceived as a competitor in terms of its core mission – can provide an incentive for another group of actors to coalesce and form an alternative network.

### Organizational Triggers for Network Formation

Organizational triggers refer to the influence, incentives, and pressures of the member organizations involved in the network building process. These triggers are therefore internal to the

network and indicate the way that societal organizations are conceived of or established individually or are already working together on the basis of loose ties.

In terms of key organizational triggers, a policy network may be activated where certain conditions are present. For example, where there is a high internal management capacity within the network such as a formalized steering group. Another key trigger is the existence of similar belief systems among network members such as the perception of a situation as a crisis. A policy network may also emerge in an environment, which promotes discursive practices such as face-to-face interaction for consensus building. The presence of actors with strategic oversight capabilities or the existence of one or two focal actors within the network is also a key trigger for network formation.

Three further organizational triggers can assist with the emergence of a policy network. First is the existence of network entrepreneurs. The long-term success of initiatives to build networks is not a given. Networks sometimes fail for a number of reasons, including lack of interest/buy-in from potential members, time and resource constraints, and an inability to coalesce around shared problems. Indeed, network formation processes are often kick-started and assured over time by key actors, who, by exerting their influence and providing momentum, drive the process forward. Such actors can be described as network entrepreneurs. These are often individuals instrumental in organizing, facilitating, and managing a network from the outset and doing so with considerable personal initiative and risk. Second is the existence of network mentors. The role of a mentor in introducing individuals to networks is commonplace. Yet the presence of an effective mentor is also a key driver in creating new networks. Third, the presence of a network member organization, formally or informally recognized by other members as the network leader, is key to network formation processes.

## Future Perspectives

Key future perspectives for network formation research focus on applying these triggers to comparative cases in order to test their broad applicability and to help establish patterns of generalizability. Two approaches are intrinsic to this. First, we need to learn more about how transnational networks form in specific regional integration contexts like the EU and second whether the same processes are present across international settings. Only by exploring the relevance of environmental and organizational triggers for network formation on this wider scale is it possible to have a better understanding of processes linked to network formation. Network formation triggers could also be tested in comparative contexts across novel as well as more established networks. Such comparison could bring out the relevance of these triggers in network formation in wider contexts. Future research could also explore whether the response of network members to formation triggers shapes the ever-evolving structure and outline of new networks and their effectiveness. Finally, additional qualitative work into individual organizational and environmental triggers to explore overlaps between categories of triggers will be important. Disaggregating triggers and studying them individually may achieve further insights. For example, the role of network mentors is a potentially crucial organizational trigger for new network formation, and it would be interesting to explore the role of such mentors in facilitating the formation of multiple networks.

## Conclusion

Policy networks characterized by a group of actors linked formally or informally around common concerns are omnipresent in society. Little is known however about the manner in which such networks form and develop at the earliest stages. To explain what spurs a group of otherwise autonomous actors and/or organizations to begin interacting with each other to form a policy network end, a range of triggers, categorized as either environmental or organizational, can be identified and have been explored in this piece.

This exploration was not however exhaustive. Additional network formation triggers exist, which point to the benefits of being part of a network and which consequently act as drivers for their formation. These include the opportunity

of burden sharing by operating as part of a network; the prospect of mutual assistance and information exchange between organizations operating as a network on complex issues such as legal compliance and technical advice; the increased access to resources individual actors achieve by operating in a network; the prospect of more intense (informal) communication, diverse knowledge, and trust relationships that can be achieved as part of a network; and the overall reduced uncertainty in decision-making which networks can provide. It is also worth highlighting that individual organizations are more likely to access policy-makers via a network, because advocacy messages are amplified in network settings.

Although there is a great deal of research into the contexts in which policy networks are manifestly flourishing such as specific political contexts like the USA or in international organizations like the EU, we know little about their internal workings. This is particularly true of internal cooperation among members, including their bargain-striking practices, which often reshape decisions, day-to-day operations, or broader impact on world-politics. So although policy networks may play out differently in different international organizations or political contexts depending, for example, on the political system type, whether they can be characterized as more neo-corporatist or pluralist or whether their society can be defined as monocultural or multicultural and so on, policy networks provide a useful lens through which we can better understand these aspects.

# Governance and Power

Piero Mastroberardino and Giuseppe Calabrese
Department of Economics, University of Foggia, Foggia, Italy

## Definitions

| | |
|---|---|
| Governance | Governance can be defined as a process of negotiation among different bundles of interests in which actors (individual or coalitional) pursue a mutually acceptable outcome. The governance (of an organization) is a result of a power game based on continuous individual and coalitional strategies. It appears as the effect of a complex network of interdependent actions, as a never-ending continuous construction. |
| Power | Power is a sort of exchange value. It can be defined as a set of processes by which certain actors (individuals or coalitions) interact, cooperating and/or conflicting in a complex social work of construction of fields of strategic action. |

## Introduction

The management literature shows a sort of continuum between two main approaches to describe the processes of governance and power (Mastroberardino 2010):

1. On one hand, the traditional view of top management as the helmsman of the organization, which has all the relevant information and all the levers needed to lead and coordinate, organically and harmoniously, all the parts and activities of the business. Wide and referenced scientific studies define the "true" or the "best" rules of governance and determine the strategies for success and development.

   Smart groups of leaders, supported by technicians and experts, enlightened by science, conceive and design a rational strategic road map and the compliant organizational structure and operative mechanisms. Governance is a top-down process, interpreted in a prescriptive pattern, as it should be or as we would like it to be, coming to a complete explanation of the organizational phenomenon. Within this view, organizations are fully designed entities, starting with the vision of a designer's mind, able to define, according to a model of exante rationality, both strategies and operations, both organizational modules and their functions, and both differentiation and integration mechanisms. In one word, the equilibrium. Under this light, power is a key factor for the process of governance; particularly power is intended as a strength: "A has power over B to the extent that he can get B to do something that B would not otherwise do" (Dahl 1957). Power is also defined "as the ability of an individual or group to achieve their own goals or aims when others are trying to prevent them from realizing them" (Weber 1978). The hierarchical power is the only healthy form of power. Any other source of power is qualified as dysfunctional.
2. On the other hand, using biological metaphors, there are many approaches that show the process of governance as a spontaneous ordering process, due to the phenomena of self-organization and able to create virtuous development processes. Models of self-government (of the firm, of the territory, of the country) should then come out, according to a bottom-up pattern, able to eliminate any power effects and reduce to unity the multiplicity of interests of the actors. The concept of power itself tends to blur; the organization evolves according to its organic life cycle.

All the cited approaches refer to the same paradigm, which is widely dominant in management studies, the so called as "unified approach" (Burrell and Morgan 1979). This paradigm, although with significant differences between the "board of designer" option, or top-down perspective (Bertalanffy 1968; Beer 1966, 1967; Scott 1981), and the "self-organization" one or bottom-up perspective (Morin 1990; Prigogine and Stengers 1981), reifies the organization and interprets it as a collective entity with its own identity and strategic thinking aiming at generating order, harmony, and integration. In other words, organizations are defined as a "predetermined system with respect to the actors" (Maggi 1990; Mastroberardino and Calabrese 2013). This paradigm is characterized by the interpretation of each organization as a system, which is divided into subsystems at lower levels and is part of inclusive, higher-level systems. In this way, all the social actors are interconnected in a total and charming – at first glance – representation of functioning of the whole society. The actors, in the frame of predetermined systems, operate for common good of the organization. The healthy forces of cooperation and convergence are projected to prevail over individual diverging interests. The strategic goal becomes the survival of the system. The actors operating within the organizations become human components.

In the following, according to previous considerations, an alternative paradigm is shown to understand the processes of governance and power. It is called "the Situationist View of the Organizations" (SVO). In a situationist view, some new topics – institutional processes, coalitional games, and power dynamics – suggest different considerations about the processes of governance and power. Two theoretical approaches, seemingly divergent, are linked to these roots (Barley and Tolbert 1997; Mastroberardino 2006): the political approach and the neo-micro-institutionalism in organizational studies. The political approach emphasizes the strategic action of the actors (individual or coalitional) oriented to protect their own specific interests. On the other hand, neo-micro-institutionalism focuses on "material and symbolic constraints that institutions make on human

behavior" (Bonazzi 2000). Within the SVO, the concept of actor (or strategic actor or local actor) is particularly relevant. It refers to an individual (human actor) or, more often, a coalition of individuals able to act strategically for the protection of their specific interests. The concept of strategic actor goes far beyond the organizational boundaries, as often a coalition is composed by both internal and external members.

## The Situationist View of the Organizations

Prior to present the peculiar meaning of governance and power, as provided by the situationist view, it is appropriate to briefly introduce and epistemologically locate the framework itself (Sparti 2002).

First of all, let's point out its clear distinction from the contingency theory, which is – in organizational studies – also called "situational approach" (Burns and Stalker 1961; Lawrence and Lorsch 1967). The distance is relevant: the paradigm of "concrete system built by the actors" refers to the micro-actionist epistemological framework, in particular, social phenomenology (Berger and Luckmann 1966), symbolic interactionism (Mead 1934), and ethnomethodology (Garfinkel 1967).

This different paradigm, a synthesis between political and neo-institutional perspective, qualifies each organization as a space of games, a place of different interests and different strategies, and a place of interaction, negotiation, and conflict among actors and their coalitions (Mastroberardino et al. 2013).

On one hand, the neo-institutionalism (Powell and DiMaggio 1991) allows to take distance from the settings of strong rationality (both individual and systemic) which populate the management literature, and to focus our attention on the institutional framework (beliefs, rules, constraints, pressures, practices, and myths) and institutional pressures that work on the actors of a specific "field of concrete action" (Thompson 1967). On the other hand, deepening the concept of power (Crozier and Friedberg 1978; Pfeffer 1981), the complex coalitional dynamics that really orient innovative action within the organizations come in evidence, beyond the pseudo-engineered and naive representation proposed by some school contributions. The situationist view leaves the "pretense of knowledge" (Hayek 1989) that characterizes the epistemological framework of the prevailing paradigms in management and their integrated and coherent idea of the organizations. On the contrary, the effort is oriented toward a weaker vision, less desirous of catching – sooner or later – the general laws of explanation of the governance phenomenon, and oriented to understand, case by case, the complex institutional and power dynamics that produced certain results.

The organizations do not exist as strategic actors. They are not qualified as a "predetermined system with respect to the actors" but as a "concrete system built by the actors." The organizational strategies, then, become rationalized myths, an intersubjective construct not assisted by an aura of objectivity and functionality to the interests of organization itself. It is the result, influenced by unintended effects, of the strategic action of a protempore dominant coalition. The situationist view of the organizations is focused on the processes of "action" and "institutionalization," based on the concrete contexts of human action in everyday life. The continuous work of these two processes produces building, breaking, and reconstruction of social reality (Giddens 1984; Searle 1995). Between action and institutionalization arises the vision of an actor who, even institutionally constrained, does not surrender to act strategically (Fig. 1).

The strategies of the actors contribute to – even not strictly determine – the construction of the complex social reality that we call organization. In a situationist point of view, an organization is therefore defined as a "concrete system built by the actors," never a "predetermined system with respect to the actors."

## Governance and Power in a Situationist View of the Organizations

Shifting from the paradigm of the "predetermined system with respect to the actors" to the paradigm of the "concrete system built by the actors," the concepts of governance and power radically

**Governance and Power, Fig. 1** (Source: our elaboration)

change. Understanding the organization as a "concrete system built by the actors" means focusing on the political and institutional dynamics among different interests from which interaction, conflicts, and negotiations arise. The process of governance, therefore, cannot be seen as the solid and rational effect of a rational strategic planning: it has to be considered as a pro tempore local order, that is, at the same time, product and constraint of human interaction between action and institutionalization.

The actors (individual or coalitional) work to structure social interactions within a "field of concrete action" for their own advantage, in order to gain, preserve, and increase their degrees of freedom and unpredictability (Friedberg 1994). Strategic action is accomplished by using power and political mechanisms (communication, negotiation, cooperation, and conflict) in order to increase their influence. So they contribute, even not wholly intentionally, to create, preserve, or change structures of organizational governance, which are only protempore stable.

The concept of power with respect to a specific field of concrete action is central to this approach. Power is defined as power-exchange and not as power-strength (March 1994), a social work of construction of fields of strategic action and degrees of freedom with respect to the constraints of a specific local context and not just a struggle among opposing groups.

On the other hand, neo-micro-institutionalism focuses on material and symbolic constraints that institutions generate on human behavior, institutional frameworks, and institutional pressures that work on the actors of a specific field of concrete action. Institutions, however, are not natural entities: they appear as the non-deterministic result of strategic action of the actors who, even unintentionally, end up creating a pro-tempore coercive local order. With respect to this order, the strategic actors, with the aim of achieving legitimacy, adapt their strategies to institutionalized rituals and behaviors to common practices and procedures, reinforcing the "iron cage" of institutional isomorphism (DiMaggio and Powell 1983).

The process of governance, even building an institutional framework defined by the balance of power among actors and compelling to them, never produces a definitive and irreversible outcome. It appears as the effect of a complex network of interdependent actions, as a never-ending continuous construction. In other terms, governance can be defined as a process of negotiation among different bundles of interests in which actors (individual or coalitional) pursue a mutually acceptable outcome (Pruitt 1981). As well as social order is a product of negotiations, so negotiating is in turn limited by previous interactions. Rules and constraints, thus, on one hand create order and minimize uncertainty while on the other hand generate new conflicts, contradictions, and ambiguities.

The natural, social, cultural, and economic characteristics of the environment, the indeterminacy of human action, and the political nature of the phenomenon do not allow an approach

to governance aiming at defining its general laws. On the contrary, priority should be given to qualitative research methods aiming at understanding, hic et nunc, the specific power relations among the actors. The pretense of knowledge inherent in the paradigm of "predetermined system with respect to the actors" is weakened, as well as the idea of governance as a consistent, defined, purely technical perspective. Exante rationality of strategic planning is replaced by expost rationality of the "dynamic, contextual and practice dimension of acting of the actors" (Ogien and Quéré 2005).

This approach does not deny the existence of strategic planning processes or other systematic mechanisms of management, but debunks them and switches them among the "strategic games" that characterize the process of governance as a process of social construction of reality. The process of governance, therefore, looks like a general frame which has few, blurred requirements of a map, to be followed by actions that resemble a path to open along the way and not a track on predetermined rails. In this perspective each pattern of corporate governance shows the coding of a social and political negotiation and, at the same time, the crystallization of certain power relations among local individual or coalitional actors. The actors evaluate, select, and use these patterns depending on the objective to be pursued. Each pattern, in fact, is not merely a technical vehicle for governance but underlies a symbolic dimension and a political dimension that, in concrete, produces asymmetric consequences among different local interests. Moreover, once adopted a pattern, the actors, with respect to their perception of the constraints and opportunities resulting from its adoption indefatigably work to limit its effectiveness or adapt its consequences. On one hand, the adoption of a pattern of governance creates a push toward the institutionalization; on the other hand, it triggers new power strategies (actions) through which the actors try to become the masters of the game.

These considerations invite us to overcome the temptation to obtain an explanation model of the dynamics of governance and, finally, maybe a general theory of governance. The process of governance is not the result of a specific cause, is not induced by any objective set of resources or constraints, and cannot be abstractly planned. On the contrary, it is a political and institutional process among the actors, different and divergent stakeholders, working strategically to obtain resources within the constraints generated into the institutional framework.

| Unified approach | | Situationist view |
|---|---|---|
| The organization is a predetermined system with respect to the actors<br>The organization is reified, as a strategic actor itself, with a proper strategic thinking | | The organization is a concrete system built by the actors<br>The organizations do not exist as strategic actors |
| Top-down perspective (board of designers) | Bottom-up perspective (self-organization) | |
| Governance is a rational process, driven by a small group of people, oriented to optimize the value of the system with the aim to pursuit the common good | Governance is a spontaneous process that generates order through which the organization goes toward higher levels of complexity both in terms of organizational structure and operations | Governance is a process of negotiation and conflict among different bundles of interests in which actors (individual or coalitional) pursue a mutually acceptable outcome |
| Power is a strength, particularly: A has power over B to the extent that he can get B to do something that B would not otherwise do. Power is also defined as the ability of an individual or group to achieve their own goals or aims when others are trying to prevent them from realizing them | The concept of power itself tends to blur; the organization evolves according to its organic life cycle | Power is an exchange value and can be defined as the set of processes by which certain actors (individuals or coalitions) interact, cooperating and/or conflicting in a complex social work of construction of fields of strategic action |

## Conclusion: Power and Institutional Dynamics about Model of Governance

Through these lenses, the process of governance becomes a result of a power game based on continuous individual and coalitional strategies. Communication and negotiation processes structure a protempore local order, that is, at the same time, product and constraint of human interaction. Putting these different lenses on, a deep pattern of political actions comes in evidence, aiming at protecting the interests of specific coalitions but systematically communicated as functional to the harmonious development of the organization in order to pursue "common good."

The protempore dominant coalition works to give an identity to the organization, helpful to a looked-for positioning and to the acknowledgment of the role of collective actor in a wider institutional framework. In this institutional work (Lawrence and Suddaby 2005), this coalition in pursuit of legitimacy and consistency with the institutional framework tries to connect with the key players, evaluates the available options, and chooses a path rather than another based on the opportunities that aims to catch.

The available options are undoubtedly influenced by certain characteristics of the environment, but the strategic choice of a specific development path is the result of political and institutional games among the actors who later on, in a justificatory perspective, build a coherent and rational story that strengthens – or weakens – the social construction of corporate vision and mission.

The objective character of some strategic decisions fades. It rather appears as a social construct, emerging from a complex institutional work in which specific strategies of power and communication are compared (Cyert and March 1963).

Once erected and appropriately justified, a certain model of governance becomes a specific dimension of meaning for the actors, who are pressured to conform their behavior to gain legitimacy and not be excluded from local practices of distribution of value (funds, institutional roles, etc.). In this perspective, a model of governance, like any other form of social construct, is an instrument of power – cognitive, semantic, and cultural – through which it is possible to steer the behavior of the actors and the dynamics of business development.

For example, the opportunity to obtain some funds for a department project, linked to a certain model of governance, applies a pressure with respect to middle management choices and increases the degree of institutional thickness toward the model of governance embedded in those plans, generating the well-known phenomenon of self-fulfilling prophecy (Merton 1948). Through these processes of isomorphism, strategic actors reinforce the model of governance. Macrolevel (model of governance as a social construct) and microlevel (individual or coalitional strategies and power dynamics) are inextricably intertwined.

In other terms, once institutionalized, a certain model of governance generates and endorses socially correct beliefs and practices, becoming a rationalized myth (Meyer and Rowan 1977). A rationalized myth is a powerful taken-for-granted rule or belief system that embodies stories about cause and effect and successful solutions to problems. It appears rational because it specifies what the actors must do to be efficient, but it's a myth because its effectiveness depends on the fact that it is widely shared rather than inherently correct (Scott 1983). A rationalized myth is expressed in various forms: classifications, evaluation criteria, performance criteria, quality or environmental standards, product standards, contracts, and so on. A rationalized myth challenges the notion of an objective rationality, arguing that concepts of rationality are socially constructed by widely accepted norms and patterns of behavior.

On the other hand, rationalized myths are not immutable but constantly changing: the actors (individual or coalitional) continuously challenge a certain model of governance – which obstructs or damages their interests – to build a new, different one, where they could have wider degrees of freedom. The potential for change depends on the degree of cultural persistence. In particular, there are three fundamental aspects to understand: generational uniformity of cultural understandings, maintenance of these understandings, and resistance of these understandings

to change (Zucker 1977). The higher is the degree of objectivity and exteriority of a rationalized myth, the more effective will be the transmission of cultural values to the actors and the smaller the potential for change and the probability of break-up of the institutional framework.

In the situationist perspective, a model of governance provides a temporary general screenplay to the actors. In relation to this screenplay, coherent scripts are written (vision, mission, strategic plan, development projects, etc.) emphasizing some aspects rather than others. Roles, behavioral expectations, schemes, and procedures emerge to regulate the relationship among the actors.

## Synonyms

Professional control; Professional governance; Professional self-regulation

## Definition

Professionalism is a form of governance that is often used to organize and control work performed by occupations with specialized competencies, skills, or knowledge and the ability to provide society with especially important services. Professionals are able to organize and control their own work thanks to a set of interconnected institutions providing economic support and social organization.

## Introduction

Organizational theory uses the term "professionalism" to explain how the work of specific occupational groups is organized and controlled. Doctors, nurses, lawyers, advocates, teachers, social workers, and journalists are typical examples of occupational groups whose work is organized and controlled through the logic of *professionalism*. To distinguish professionalism from managerial and bureaucratic forms of governance, Freidson (2001) defines this form of social control, professionalism, as a "third logic": "Professionalism may be said to exist when an organized occupation gains the power to determine who is qualified to perform a defined set of tasks, to prevent all others from performing that work, and to control the criteria by which to evaluate performance" (Freidson 2001, p. XI).

From a functionalist perspective, professionalism emerges as a superior form of governance when (1) the job is based on technical (not scientific) knowledge acquired only through long prescribed training and (2) the professionals adhere to a set of professional norms (Wilensky 1964, p. 138).

From this perspective, the professional autonomy of workers using complex technical knowledge descends from the ineffectiveness of bureaucracies and markets in overseeing professional work. Unlike market-based and bureaucratic models of governance, professionalism represents a primarily non-hierarchical model of governance. Hence, professionalism is based on collegial relations, skills, competencies, and expertise, on shared social identities, professional values, and moral obligations (Evetts 2003). Markets and bureaucracies are two ineffective modes of control for work that requires a vast body of highly specialized knowledge; this work is also complex in the sense that it cannot be formalized in complete written procedures, because it relies on the application of complex tacit knowledge to specific situations. Neither clients nor bureaucrats can master the complex knowledge needed to evaluate ex ante or ex post what is the best decision in a specific work situation involving complex and tacit technical knowledge. Under this contingency, social control of work requiring professional autonomy can only be left to the professional community of workers performing that specific kind of work. To execute such control, the professional community sets up a set of interconnected social, cultural, and economic institutions to monitor, evaluate, and discipline the professional behavior of each member. Professional associations, certifications, licensure, conferences, professional standards, and professional ethics are examples of such institutions.

As stated by Noordegraaf (2007, p. 766), "Professional associations determine who is 'in' and who is 'out' and what professionals ought to do; when professionals do things, they reinforce professional associations. As content and control reinforce each other, classic professionalism is a matter of controlled content that sets professional work apart from nonprofessional work. This occupational closure is a matter of both functional, as well as social closure; it is about membership criteria as well as professional identity."

On the one hand, social control of professionals happens in professionalism-based governance arrangements through what Ouchi calls *clan control*, a "relatively complete socialization process which effectively eliminates goal incongruence between individuals" (Ouchi 1979, p. 833). Long training processes and professional closure have two functions; they serve to transmit complex technical knowledge and to socialize occupational workers through a set professional norms (Kendall et al. 1957; Salvatore 2006). Professional norms, ethics, and best practices aim at guaranteeing that the members of the profession act in the interest of their clients even when the client is unable to effectively control the work of the professional (Carr-Saunders and Wilson 1933; Goode 1957). From this perspective, the elevated economic and social status traditionally enjoyed by professionals has the function of letting professional workers focus on the client's interest rather than having to worry about their own mundane financial needs (Konzelmann et al. 2007).

On the other hand, professionalism happens when, at the collective level, an organized occupation gains the power to determine who is qualified to perform a defined set of tasks, to prevent all others from performing that work, and to control the criteria by which to evaluate performance (Freidson 2001, p. XI). This power ultimately depends on the power of the State, because it emerges and is maintained through laws and regulations passed by law- and policy-makers who support the occupation's quest for self-control (Sarfatti-Larson 1978).

The "third logic" of professionalism therefore requires the bureaucratic logic of public authority in order to operate: the State protects the tasks in the profession's jurisdiction from those outside the profession using its laws and law-enforcement institutions. Moreover, professionalism alters the governance mechanisms that are typical of markets and bureaucracies, but it is not entirely an alternative logic: professionals either are self-employed (i.e., in market arrangements) or work in public, private, or private not-for-profit organizations (i.e., in bureaucratic arrangements).

## The Rise of Professionalism

Some of the characteristics of contemporary professions may be traced back to eleventh-century Europe, when a great movement toward associations of workers (e.g., doctors, teachers, merchants, or craftsmen) created institutions such as guilds and corporations in order to defend their tasks from those outside the occupational community (Carr-Saunders and Wilson 1933, p. 289).

Magali Sarfatti-Larson (1978) describes the *professional projects* of occupational groups aimed at establishing their professional status with the support of the State and of corporate capitalism. Rather than taking a functionalist perspective, she focused on social mobility, power, and inequality and examined how occupations organized themselves to attain market power in the nineteenth and twentieth centuries in England and in the United States. From this perspective, she shows that professional knowledge is a "crucial element in the structure of modern inequality and professionalism appears *also* as a collective assertion of special social status and as a collective process of upward social mobility" (Sarfatti-Larson 1978, p. xvi).

The rise of professionalism as a form of governance of a specific economic activity, therefore, depends on the (ever-changing) nature of knowledge used in the activity and on the success of the collective action of an occupational group in having its professional project recognized by the wider society and by the law.

Professional groups claim jurisdiction over the use of a specific set of expert knowledge to gain

status from the public, but they also pursue intra-professional status; the result of the actions of these groups is a complex *system of professions* (Abbott 1988) defining the set of tasks reserved for each group and the status of each group compared to that of other professional groups.

## De-professionalization

Professionalism has recently been exposed to significant changes and subjected to external influences. In a sense, professions have increasingly been governed. In other words, we can speak about a move from the governance *through* professionalism to the governance *of* and *through* professionalism. Occupations' new and existing professional projects face many obstacles in obtaining or preserving their professional status. Professional self-regulation has come under critical scrutiny in many different contexts, and the word *de-professionalization* has been used to label a set of phenomena leading to the diminished monopoly of tasks in the professional jurisdiction, autonomy in work performance, or authority over clients (Haug 1988).

A threat to professional projects is the rising level of public schooling and computerized access to information, which may erode the monopoly of esoteric knowledge as a basis for professional autonomy (Haug 1988). Education and the availability of information contribute to the de-professionalization of occupations by changing the professions' monopoly over knowledge and increasing clients' power.

Moreover, from an economic perspective, professional licensing artificially restricts the supply of services and raises prices (Friedman and Kuznets 1954). Indeed, many critics charge that professional self-regulation inhibits competition, is unable to regulate transnational work effectively, and facilitates professional misconduct (Adams 2016, p. 70). The "new public management" (NPM) movement, with its focus on making serving provision more efficient and effective through the introduction of competition and managerialization, is most often seen as the main driver of changes to the organization of professional work. These processes inspired the introduction of the notion of hybrid professionalism (Noordegraaf 2007).

## Future Perspectives

Managerialization of professional work has drawn attention from scholars of NPM-based reform, and an ontological *clash of cultures* (Raelin 1986) between professionalism and managerialism has been posited, on the grounds that a core characteristic of professionalism is that members of a profession use their autonomy in the best interests of their clients, whereas a core characteristic of managerialism is a concern with efficiency. Recent studies suggest that scholars should move away from this binary approach to acknowledge a more nuanced perspective (McDonald 2015; Numerato et al. 2012), because reviews of empirical studies show that strategic adaptation, cooptation, and negotiation among the two logics of managerialism and professionalism are much more frequent than hegemony and resistance. Many authors have described the hybridization processes of professionals in managerial roles (Kitchener 2000; Noordegraaf 2007; Kuhlmann et al. 2013; Spyridonidis et al. 2014; Thomas and Hewitt 2011; Thomson et al. 2014), suggesting that managerialism and professionalism should be viewed more as overlapping discourses than as competing logics (Olakivi and Niska 2017; Toren 1976).

Moreover, further research will examine the scenarios of collaborative, networked, and highly dynamic professional communities. Market and organizational pressures will not necessarily be seen as principles, which are averse to the logics of professionalism. On the contrary, market and hierarchy have recently been viewed as vehicles that stimulate collaborative and frequently multidisciplinary work with possibly innovative outcomes (Adler et al. 2008). We can expect that further perspectives will also critically examine their performance of selected clusters of clients, customers, and citizens who are knowledgeable

about various aspects of professional work. In this regard, professionalism faces not only the challenge of managerialism but also the challenge of critical public involvement. The voice of citizens is heard thanks to emerging institutional arrangements and deliberative public policy. In this vein, professionalism will listen to the citizens' voice (Renedo et al. 2018). Finally, the role of digital technologies in these processes will be explored. Digital technologies not only enhance the collaborative professional communities but can also increasingly serve as bridges between professional communities and clients who benefit from professional services.

# Governance and Public Administration

Sadik Hasan
Department of Public Administration, University of Dhaka, Dhaka, Bangladesh

## Synonyms

Governance; Government; Public Administration

## Introduction

Governance and public administration are two key issues, which can be described as two sides of a coin. These two concepts are intertwined through another one – government. The traditional use of "governance" and its dictionary entry define it as a synonym for "government" signifying the exercise of authority over a territory or system, or in an institution, a state, or an organization (Stoker 1998). Governance, to Badun (2004), "refers primarily to government, and one of the pillars of government is public administration." Yet the growing work on governance comprises a variation in its use and construction. It would not be far from truth to say that in recent times "governance" has become a buzzword, replacing commonplace "government."

## Governance: Meaning

The concept of governance draws attention of different sets of stakeholders, e.g., social scientists, donor agencies, philanthropists, and civil society, who have come up with their own understandings of the concept. Such attempts have made it a bit difficult to agree on a universal definition of governance.

The situation can be understood from the words of Kohler-Koch and Rittberger (2006) when they opine that the conceptualization of governance still faces "confusion." For Pierre and Peters (2000), the concept of governance is "notoriously slippery," while Schneider (2004) views the conceptual vagueness of governance as the "secret of its success."

However, the attempts to conceptualize governance produce two major perspectives: the aid agency-driven perspective and the academic perspective (Haque 2011). State-market relations and technical issues like better management, state capacity both in policy formulation and facilitating implementation, etc. are the focus of the aid agency-driven perspective. On the other hand, academic perspective concentrates on "developing a better understanding of different ways in which power and authority relations are structured in different contexts" (Haque 2011). Despite that, the conceptualization of the term seems inconsistent as it has generated various definitions and meanings as discussed below.

To Jon Pierre (2000), "governance refers to sustaining coordination and coherence among a wide variety of actors with different purposes and objectives". For Hirst (2000), "governance can be generally defined as the means by which an activity or ensemble of activities is controlled or directed, such that it delivers an acceptable range of outcomes according to some established standard."

Institute on Governance (2018) in Canada offers a general definition of governance by saying that "governance is how society or groups within it, organize to make decisions." Beate Kohler-Koch (1999) relates governance to the process of policy-making. Adrienne Heritier (2002) defines governance as a "mode of political steering."

Pierre and Peters (2000) focusing on state observe: "governance relates to changing relationships between State and society and a growing reliance on less coercive policy instruments. . .the State is still the centre of considerable political power." To Rhodes (1996), governance signifies "a change in the meaning of government, referring to a new process of governing; or a changed condition of ordered rule; or the new method by which society is governed."

Lynn et al. (2000) provide a substantive definition of governance: "[as the] regimes of law, administrative rules, judicial rulings, and

practices that constrain, prescribe, and enable government activity, where such activity is broadly defined as the production and delivery of publicly supported goods and services." This definition indicates that distinct but interrelated elements formed governance. These elements include organizational, financial, and programmatic structures; statutes and laws; policy mandates; available resources; administrative rules; and institutionalized rules and norms. For Frederickson and Smith (2003), "the combined elements that make up Lynn et al.'s concept of governance are argued to describe the ends and means of governmental activity and how these ends and means connect."

Stoker (1998) also provides a detail definition of governance as five propositions of governance: "governance refers to a set of institutions and actors that are drawn from but also beyond government; governance identifies the blurring of boundaries and responsibilities for tackling social and economic issues; governance identifies the power dependence involved in the relationships between institutions involved in collective action; governance is about autonomous self-governing network of actors; governance recognizes the capacity to get things done which does not rest on the power of government to command or use its authority. It sees government as able to use new tools and techniques to steer and guide." These propositions indicate the "need for a collaborative action involving the state, market and civil society" (Thynne 2000).

After the World War II, Bretton Woods Institutions, i.e., the World Bank and the International Monetary Fund, promoted their own model of governance as a precondition of lending loan. Another international organization, United Nations Development Program, also promoted a theoretical framework of governance for both developed and developing nations. Moreover, aid-agency perspective of governance theme received a momentum after the disintegration of Soviet Union and the fall of communist rule in the Central and Eastern Europe in 1989–1992 (UNESC 2006).

In this context, the World Bank (1989) defines governance as the "...exercise of political power to manage a nation's affairs." In another definition, the World Bank (1992) observes, "...use of power in management of a country's economic and social resources for development." This definition incorporates the nature of functioning of a state's institutional and structural arrangements, decision-making processes, policy formulation, implementation capacity, information flows, effectiveness of leadership, and the nature of the relationship between rulers and the ruled (Landell-Mills and Serageldin 1991).

United Nations Development Program (UNDP 1997) defines governance as "the exercise of political, economic, and administrative relationships, and institutions through which citizens and groups articulate their interests, exercise their rights and obligations and mediate their differences." This definition focuses on three key domains of governance: the state (political and governmental institutions), civil society organizations, and the private sector (Farazmand 2013).

The Asian Development Bank (1995) also provides its own definition: governance is "the manner in which power is exercised in the management of a country's economic and social resource for development." Here, the focus is on management of the development process, involving both the public and private sectors. International Monetary Fund (2017) describes governance as a "broad concept covering all aspects of how a country is government, including its economic policies, regulatory framework, and adherence to rule of law."

Lastly, combining most of these definitions, Frederickson (2007) opines that governance is: the way government gets its jobs done; structure of political institutions; shift from bureaucratic state to the hollow state or to third party government; market-based approaches to government; the development of social capital, civil society, and high levels of citizen participation; the work of empowered, muscular, risk-taking entrepreneurs.

## Public Administration: Meaning

The literature on public administration find a wide variety of definitions of the term. Perhaps

"the rapid growth in the twentieth century of public administration, which today seems to be encompassing" is one of the major difficulties of arriving at a precise and universally accepted definition (Stillman II 1996). Some view public administration in the executive branch of government providing a narrower traditional approach while some believe public administration has some responsibilities in formulating governmental policies, besides executing them reflecting the modern approach. Despite that, the following definitions are noteworthy in defining the discipline:

To John J Corson and J P Harris, "Public administration. . .is the action part of government, the means by which the purposes and goals of government are realized."

Dwight Waldo observes: "The process of public administration consists of the actions involved in effecting the intent or desire of a government. It is thus the continuously active, 'business' part of government, concerned with carrying out the law, as made by legislative bodies (or other authoritative agents) and interpreted by the courts, through the processes of organization and management."

According to James W Fesler, "Public administration is policy execution and also policy formulation."

For Felix and Lloyd Nigro, "Public administration: (a) is a cooperative group effort in a public setting; (b) covers all three branches—executive, legislative and judicial—and their interrelationships; (c) has an important role in the formulation of policy, and is thus part of the political process; (d) is different in significant ways from private administration; and (e) is closely associated with numerous private groups and individuals."

Besides, international agency like UNDP (2003) views that public administration has two closely related meanings: (a) the aggregate machinery (policies, rules, procedures, systems, organizational structures, personnel, etc.) funded by the state budget and in charge of the management and direction of the affairs of the executive government, and its interaction with other stakeholders in the state, society, and external environment; and (b) the management and implementation of the whole set of government activities dealing with the implementation of laws, regulations, and decisions of the government and the management related to the provision of public services.

However, to understand the present status of public administration as a discipline, it is useful to have a look into its development in historical perspectives. Nicholas Henry (2012) has described the development of public administration through six overlapping paradigms: (a) Paradigm 1: The Politics/Administration Dichotomy (1900–1926); (b) Paradigm 2: The Principles of Administration (1927–1937); The challenge (1938–1947) and Reaction to the Challenge (1947–1950) (c) Paradigm 3: Public Administration as Political Science (1950–1970); (d) Paradigm 4: Public Administration as Administrative Science (1950–1970); (e) Paradigm 5: Public Administration as Public Administration (1970–present); and (f) Paradigm 6: Governance (1990–present). As Golembiewski (1977) opined, these six paradigms of public administration may be characterized and understood in terms of their *locus* (institutional "where" of the field) and *focus* (specialized "what" of the field).

## Governance and Public Administration: Supplementing or Supplanting?

Governance and public administration are as old as human civilizations, and Rhodes (2000) has identified seven applications of governance in the domain of public administration. These are: the new public management or managerialism; good governance, as in efficiency, transparency, meritocracy, and equity; international and interjurisdictional interdependence; nongovernment-driven forms of sociocybernetic systems of governance; the new political economy, including shifting from state service provision to the state as regulator; and networks.

Even then the domains of academics and practitioners are witnessing the rise of a worldwide trend of replacing governance with public administration (Farazmand 2013). To be specific, industrialized democracies have undergone a basic change in terms of purposes and methods of government during the last quarter century. Elements

like "increasing deficits, economic stagnation, disenchantment with the intermittently met promises of the welfare state, and a general sense that government was encroaching on individual liberty" have played key role in producing this change (Frederickson and Smith 2003). Frederickson and Smith (2003) opine that these changes, however, raised questions about the scope and nature of public administration, both as an academic discipline and practice, and existing theories of public administration as they redesigned the core concepts of the discipline. Thus, administrators are to shift from the bureaucratic state to what is called the "hollow state" (UNESC 2006). Hollow State is a metaphor for government that contracts out public service to network of nonprofit organizations and reduces government's role as a direct supplier of public goods (Milward and Provan 2000).

According to Frederickson and Smith (2003), "The hollow state literally redefines what the "public" in public administration means. At a minimum, the definition of public must now include a broad variety of institutions and organizations traditionally considered outside the realm of government, as well as the relationships these organizations have with each other and with policymaking authorities." Frederickson and Smith assert further that, with more emphasis on governance, "the administrative state is now less bureaucratic, less hierarchical and less reliant on central authority to mandate action. Accountability for conducting the public's business is increasingly about performance rather than discharging a specific policy goal with the confines of the law." Moreover, American Society for Public Administration (ASPA) conference of 2012 adopted "governance" as a major thematic area reflecting the growing use of "governance" in the scholarly literature of public administration (Farazmand 2013).

However, Farazmand (2013) raises question about this trend of replacement: "The contemporary shying away from, or hesitation with, the use of the traditional public administration concept, and the more inclusivity of governance may have some advantages, but they also raise problems or confusion—for example, like management, governance applies to corporate and business governance, and should we not use the prefixes of 'public' or 'private' governance—we should."

Despite that, this expansion of scholarly domain of public administration reflects as the growing interest on the concept of governance (Frederickson and Smith 2003). To Frederickson and Smith (2003), "The linguistic morphing of public administration into the study of governance acknowledges the new realities of the administrative state and is argued by some to herald a new and theoretical orientation for the discipline." As for example, Garvey (1997) uses the concept of governance to distinguish between a theory built on the politics-administration dichotomy and a new theory based on understanding the diffuse networks increasingly responsible for providing public service. Frederickson and Smith (2003) opine that such concepts of governance expand and complicate the challenge of developing public administration theory.

Although the need for public administration theory to clarify the changes in the role and practice of government is recognized, it is uncertain whether a theory of governance would be able to meet this challenge. Frederickson and Smith (2003) assert that "the Weberian model of bureaucracy and management are undoubtedly less relevant to public administration than they once were, yet they remain a sharper set of intellectual tools that the still-fuzzy concept of governance." However, it is seen that various literature of public administration nowadays lack the definition of the term "governance" and perhaps the reason for that it is understood naturally and intuitively (Osborne and Gaebler 1992).

Finally, the lack of universal definition makes governance a recognition of the empirical reality of changing times that it is a body of comprehensible theory. Yet, some believe in the potential of governance to reshape public administration as an academic discipline as inevitable (Frederickson and Smith 2003).

## Concluding Remarks

The concepts of governance and public administration have received unprecedented attention in contemporary literature. However, it seems there

is no consensus as to what they mean. Some view these concepts as synonymous while some like to keep a line between them. The nature of relation between governance and public administration – supplementing or supplanting – depends solely on the potentials of the dominant themes in the governance debate to provide the theoretical tools required to comprehend and explain public administration in today's context.

# Governance and Punishment

Sultana Jahan
Stamford University Bangladesh, Dhaka, Bangladesh

## Synonyms

Bangladesh; Justice; Penal governance

## Introduction

Governance is "the process of decision-making and the process by which decisions are implemented (or not implemented)." Governance in the context of penal policies is a matter of adjudications and execution of the criminal justice system of any state and execution of such adjudication through proper punishment if any. From the very emergence of the institutions whatever in nature in early age of civilization, governance was there for proper functioning of those very actions of the institution (society or state). Theoretically, punishment oriented in the society to prevent the crime, by its preventive and deterrent way, and to a greater extent for reaching the people's sentiment was retributive in nature (Code of Hammurabi); but always the state or government was and is very much authoritative to impose punishment in the name of better interest of the society or state. Retributive justice is a system of criminal justice based on the punishment of offenders rather than on rehabilitation. So punishment and governance and governance of punishment are to be interlinked and studied from a common "welfare-of-state" perspective, since the punishment process and punishment itself depend on socioeconomic resources of the state, though punishment and governance follow distinct procedure to fulfill their purposes and objectives. Punishment is dealt with largely by moral theorists. The neglect of punishment on the part of political theorists suggests the implausible assumption that political systems need not to worry about the issue beyond punishment. This silence is surprising given that deliberative democrats have both internal and external reasons to address the issue of punishment.

In this entry, to articulate the significance of indirect connection between two disciplines, the notion of governance is assumed as a term that refers mainly to running governments and other public agencies or private ones with social purposes of management of a country's economic and social resources.

Thus, evidently, management of economic and social resources are essential components of governance, and how far a government is executing its function in punishment policies for utmost utilization of its resources should be taken into consideration. It comprises mechanisms, processes, and institutions through which citizens and groups articulate their interests and exercise their legal rights. It's undeniable that the idea of good governance and punishment policies can go hand to hand to ensure respect for human rights and the rule of law, strengthen democracy, and promote transparency.

Another term in the realm of governance very much linked with criminal justice system is "humane governance" as it involves those structures and processes that support the creation of participatory, responsive, and accountable political governance. This process has a potentiality to be successful in punishment policies. It's true that for real execution of governance in penal policies, at first a country is likely to have an obligation to accommodate the elements necessary for establishing governance and then rearranging the penal system to ensure these elements. A developing country like Bangladesh does not clearly accept the obligation of maintaining good governance. However, it has put emphasis on good governance in its strategic development plan. Additionally, Article 77 of the Constitution of Bangladesh provides the notion of Ombudsman – an official appointed to investigate individuals' complaints against a company or organization, especially a public authority, to ensure transparency and accountability of public administration and pre-people governance. Many developing countries have prepared their own Poverty Reduction Strategy Paper (PRSP). Good

governance is an essential component in implementing the plans and strategies to achieve the targets set forth by PRSP. Good governance to enhance access to justice for the poor and improve sectoral governance has been deemed as one of the PRSP's "policy priorities."

This short write-up is the prime attempt to articulate the necessity of examining penal policies from the good governance mechanism since there is only punishment for the crime in question rather than reduction of causes and probabilities of criminal activities by proper administration of justice.

This entry also refers to justice reinvestment, a data-driven approach to improve public safety, examine corrections and related criminal justice spending, manage and allocate criminal justice populations in a more cost-effective manner, and reinvest savings in strategies that can hold offenders accountable and decrease crime.

## Connecting Dots Between Governance and Penal Polices

Since this entry concentrates on reflection of humane governance in the penal course of action, government initiatives on making use of resources in the punishment procedure as well as the effectiveness of the usage are observed and questioned. For linking the idea of governance with penal policies, people's participation is a striking point to be talked about. In addition, the responsiveness of the penal institution through crime control measures is argued here.

It can be simply started from the proposition that as far as the rule of law is concerned, each stands separately but is related to and dependent upon the others. The quality and enjoyment of each builds on the strength of the other. In this regard, sociological, economical, and political aspects of punishment are pointed out.

## Sociological, Economical, and Political Aspects of Punishment

If we look into the enforcement measures in the criminal justice system, we will observe differences in the method of penalizing offenders. For example, in some social systems, the reaction to law breaking is annihilation, in some systems severe corporal punishment, in others imprisonment or probation, and so on. Similarly the number of variations in the official policies for implementing the social reactions to crime is enormous. However, it is only the forms of punishment that have undergone historical change, not the functions. At present, modern sanctions – such as imprisonment – are considerably less severe than the terrible punishments of medieval or ancient societies, from its basic raison d'être. Interestingly, the imprisoning system is also facing criticism for its failure in certain cases. Most prisoners are not reformed, new generations of criminals go undeterred, and national crime rates are not forced into decline, so that by all these criteria, the prison is deemed an inefficient instrument. Despite recurring hopes and the exaggerated claims of some reformers, the simple fact is that no method of punishment has ever achieved high rates of reform or of crime control – and no method ever will. All punishments regularly "fail" in this respect because, as Emile Durkheim and others have pointed out, it is only the mainstream processes of socialization (internalized morality and a sense of duty, the informal inducements and rewards of conformity, the practical and cultural networks of mutual expectation and interdependence, etc.) that are able to promote proper conduct on a consistent and regular basis. Punishment, so far as "control" is concerned, is merely a coercive backup to these more reliable social mechanisms, a backup that is often unable to do anything more than manage those who slip through these networks of normal control and integration. For penal governance, the criminal justice sector generally comprises the police, judiciary (including courts, prosecutors, and defense counsel), traditional and nonformal conflict resolution mechanism, and the prisons. In addition, a number of civil society organizations also carry out activities such as legal aid in the sector. In fact, in the system of governance, judicial systems and civil society organizations perform as accountability arrangements to maintain check and balance of the government. More or less, policies of

punishment depend on the cultural and legal values behind each country's policies, because a penal system is not only deeply embedded in a state's budget but also in its political, cultural, legal, institutional, and social fabric. The criminal justice system in Bangladesh which inherits the common law system is essentially impoverished (confidential system of Bangladesh): crime is under-reported and poorly investigated by the police, the court system is slow and inadequate, and the prisons are dilapidated and overcrowded. It is not uncommon to have views expressed that the criminal justice system is a burden and part of the "problem" rather than the solution to deteriorating law and order problems. Hence a drawback in penal policies of a country which is related to political, institutional, and social factors fatally affects the society at large. To solve these problems, governance of penal policies should not be a separate factor but rather related to governance policy of a state in financial and social matter which plays a pivotal role in this regard. For better achievement of justice in the true sense of the term, we have to take a holistic approach to detect common purposes of these two separate systems (governance and penal policies) in respect of penal procedure in trial and posttrial more specifically the social and psychological impact on the accused and his family which is barely considered in any legal system.

Not only are the prisons grossly overcrowded, but the problem is exacerbated by the high number of prisoners incarcerated because of delays in the judicial system. There is no effective classification system in Bangladesh prisons, and remanded and convicted persons are often not separated. The conditions for women and juveniles held in detention require considerable improvement to ensure appropriate levels of classification, security, and humane confinement. Medical, rehabilitation, and vocational facilities are also inadequate. This element denies responsiveness of a government towards it citizens. It's true that rights of privacy, free speech, etc. are restricted for criminals and that deprivation of liberty is the sine qua non of legal punishment, in the sense that it and it alone comprises defensible legal punishment for serious offenders, but apart from that they are subject to vulnerable situations that deny their right of dignity and reintegration in society. Offenders are likely to face harm beyond imprisonment especially to the prisoner's family which is an entirely neglected topic in public policy. Though incarceration can stop the offender from drug or alcohol abuse and help him to be disciplined, study reports that problems resulting from the incarceration were more extensive. For instance, having an incarcerated parent is correlated with emotional and behavioral disturbances, such as depression, anxiety, and aggressiveness of children, and they are more at risk of becoming criminal offenders themselves. In a study it is articulated that characteristic of anger is that its action tendency is to attack if triggered by unfair behavior. An individual who experiences unfairness can have various reasons to punish the initiator of the unfair action. A reason to punish could simply be to harm the other party.

## Inquiring Rationality of Fear-Based Penal Governance

Compared to authoritarian government, a democratic government is unlikely to be arbitrary and corrupted. However a change in political system merely cannot assure the rule of law which is ultimate aspiration of governance. For instance, the majority of Latin Americans regard the law and the judicial system mainly as instruments of oppression on behalf of the elites; fear and mistrust of the justice system are common. The inefficiency and lack of credibility of the law and the justice system are crucial factors that at least partially explain the contested legitimacy of Latin American states and the feeble embeddedness of democracy in the region. But at the same time, the law and justice systems in many Latin American countries are ineffective and arbitrary precisely because the political regimes in which they are grounded have been traditionally authoritarian and exclusionist. In fact, when the government, in the name of reform, reduces complex social problems to a policy of social control, it actually weakens the rule of law and increases violence in

the region. Fear is also a fundamental element as far as the punitive policy of Bangladesh is concerned. It's true that fear of painful punishment was a strategy generally applied in the medieval ages, but with the development of democratic norms, its application decreases. Basically the role of fear is very marginal. So penal policies based on fear with the expectation that harsh punishment would be successful in prevention of crime is an outdated idea.

## International Obligation on Access to Justice and Its Significance in Penal Policies

The Universal Declaration of Human Rights 1948 deals with access to justice in Articles 7–11 where it has declared that everyone is equal before the law and has a right to get equal protection of the law and everyone has a right to an effective remedy by a competent tribunal.

The Constitution of the People's Republic of Bangladesh 1972 provides the provisions of access to justice as fundamental rights in Articles 31, 32, 33, and 35, where it has provided the right to protection of the law, protection of the right to life and personal liberty, safeguards as to arrest, and detention and protection in respect of trial and punishment as the fundamental rights of every citizen or person. The right to move the High Court Division to enforce the fundamental rights is also declared as fundamental rights in the Constitution. The UNDP has got its own standard to assess the access to justice of a particular judicial system. UNDP determines five operational aspects of access to justice. For assuring access to justice, the right of the victim as well the right of the accused should be counted as it is the fundamental principle of criminal law that the quantum of punishment should be regulated by the principle of proportionality between the sanction and the gravity of the offence. A rational sentencing policy proportionate to the magnitude of harm inflicted on the society is prerequisite for a sound criminal justice system. Furthermore, only implication of harsh punishment is unlikely to response effectively in crime prevention as potential offenders commonly do not know the legal rule either directly or indirectly.

## Governance Through Participation and Its Impact on Criminal Punishment

It is undeniably true that larger involvement of citizens and civil society is necessary for proper function of governance. "Engaged governance" is another key ingredient in advancing poverty eradication and broad-based development by promoting greater participation of citizens and civil society institutions in public governance. The rule of law refers to a principle of governance in which all persons, institutions, and entities, public and private, including the state itself, are accountable to laws that are publicly promulgated, equally enforced, and independently adjudicated and which are consistent with international human rights norms and standards. It requires, as well, measures to ensure adherence to the principles of supremacy of law, equality before the law, accountability to the law, fairness in the application of the law, separation of powers, participation in decision-making, legal certainty, avoidance of arbitrariness, and procedural and legal transparency. In other words, application and accomplishment of the principle of governance in punishment measures immensely depended on the presence of accountability and transparency of the authority concerned as well as active participation of the community. Restorative justice is a glaring example of governing penal policies through participation of the people and authority concerned to ensure rule of law. Restorative justice is a system of criminal justice which focuses on the rehabilitation of offenders through reconciliation with victims and the community at large. In Bangladesh, restorative justice is practiced under the Village Court Act 2006. Although a village court can only pass order for compensation, it creates space for the community to apply, to a great extent, community sentiments, understanding values and preference in the decision-making process. It focuses on the root causes of disputes in participation of the community representatives and looks for win-win solution so that no spiral of

further disputes takes place. What is more, the communities are responsible for situations which are causing or encouraging crime so consequently, and accountability of the community can be examined. Ideally, restorative justice can provide a catalyst and forum for exploring and assigning these needs and responsibilities. On the other hand, in the formal judicial process which is based on more retributive principles, the system requires the punishment of the offender, focusing on the law that has been violated, rather than taking into account the victim's interest or priorities. In this system the victims and offenders have an active role and right to participate in the choice of adjudicators. These positive effects contribute towards minimizing social conflict and human rights violation and improving respect toward each other. The village court process can successfully address the underlying problems that emerge as crime and disputes, rather than continuing the criminal justice system's focus on the offenders only. The type of motivations must be present, among the punishers and the punished, for punishment to be an effective institution for the promotion of cooperation.

## Social and Economic Development Results into Crime Prevention

It is widely believed that job creation can reduce crime. Participants in CWP, most of whom are women, receive CWP wages that enable women in poor communities to better provide for their children. The possible impact of CWP wages may be in reducing childhood risk factors for involvement in crime. In addition, emotions are an essential component of decision-making. So, a decision under emotional redress and economic insecurity carries the possibility of causing antisocial activities. Reducing the economic uncertainty and emotional redress is possible as CWP works against poverty and economic instability. Another significant impact is increasing women's economic resources which empower her to bargain for a better situation for herself, therefore reducing her risk of abuse. Consequently an economically solvent woman is unlikely to be a victim of gender-related crime. In this way resources of a state can be utilized for ensuring social and economic development as well as preventing potential crime. A government should think about probable socio-economic impact on crime prevention before prioritizing budgetary allocation in this regard.

## Reinvesting Justice

As a philosophy, justice reinvestment holds that money spent on incarceration instead could be much better spent on community-based development. Justice reinvestment can be understood best as a broad strategic plan of action; incarceration rates are purposefully reduced through new sanctioning policies and practices, and the money saved by doing so is invested in local communities hard-hit by crime and cycles of incarceration.

## Conclusion

The criminal justice system has a broader goal of both crime control and crime prevention rather than simply the reaching of judgement. Unfortunately the criminal justice system of Bangladesh has excessively focused on goal of crime control through imposition of harsh punishment rather than its prevention. Harsh criminal laws and colonial and pre-independence statutes tend to create serious human rights implication for those accused under these laws. In keeping with the growth of human civilization, social values and knowledge of criminal behavior, the penal philosophy has shifted its emphasis from retribution to deterrence and finally top reformation and social regeneration of the deviants. Therefore, penal laws need to be re-examined in the light of current penal philosophy of reformation. Establishing restorative justice, access to court, and crime prevention should also be acknowledged and fully integrated in the criminal justice system. In this way political notion of governance can play a vital role by ensuring its true

response to crime, participation of the community concerned, and arranging penal policies with keeping into mind moral, sociological, and financial aspects of both the victim and the offender. It's undeniably true that a society cannot be absolutely exempted from crime; nevertheless, with the holistic approach of the state through proper utilization of socioeconomic resources in development activities, reintegration of the offender in society can ensure accountability of the state to maintain the rule of law in society.

# Governance and Regulations

Md Nurul Momen
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Governance; Government; Regulation; Regulatory governance; Regulatory framework

## Definition

*Governance* may be described as the rules and processes of decision-making that affect the way in which powers are exercised.

*Regulation* is the diverse set of instruments through laws, formal and informal orders, and subordinate rules by which all levels of governments use to intervene in the economy and life of their citizens.

## Introduction

Regulation is placed at the important debates and discussion in public administration. It refers to a process under the rule of the government, usually in the centralized nature and in more or less independent regulatory agency. This agency makes decisions in certain conditions where there are conflicting of interests in economy and society. The idea behind the regulation is that decision-making is so complex and dynamic in today's world; as a consequence, a specialized regulatory agency will be well equipped to perform, compared to the regular bureaucrats (Kleinsteuber 2004). The domain of regulation is continuously expanding that could be the regulation of financial systems, regarding food intake, or criticism of red tape; debates about the appropriate level of regulation are never far away (Lodge 2016). Hence, it is pointed out that it is increasingly a necessary mode of political intervention which is being applied to many areas ranging from agriculture to health and environment and even touching on the new areas of technologies.

However, the late twentieth century witnessed the rise of the regulatory state, in the case of introducing regulatory institutions, rules, and processes of governance in many of the developed countries. On the other hand, it is also witnessed the delegation of power in the nature of state intervention has been pointed out by challenges to traditional ideas about the role of the centralized nature of the government in regard to its dominance in some areas such as collection of revenue and maintenance of law and order and promotion of the rule of law and democratic process, as transnational and non-state power have received growing importance in society (Scott 2001). However, the paper shortly discusses regulation and its relationship with governance and the factors for emergence and importance of regulatory policy and finally examines the necessity for good regulatory governance for the sake of economy and society.

## Relationship Between Regulation and Governance

Regulation is not easy to define due to its highly contested topic. It is found different interpretation to different people. Hence, the notion needs extensive clarification and determines its boundary. From the critical perspective, regulation refers to the hands of authoritarian governments and their formulated rules that limit human or national liberties (Levi-Faur 2010). The first point regarding regulation and governance, it is more or less as synonyms. In this sense, regulation and governance both refer to systems and process that aim at influencing public goals. It could be explained in a way that regulation is a subset of activities that is encompassed with the overarching term governance. However, regulation indirectly affects the distribution of scarce resources in society by introducing monitoring and enforcing norms and standards. On the other hand, governance refers to both direct and indirect attempts to achieve public goals by way of "providing, distributing, and regulating" (Mascini and van Erp 2014).

## Importance of Regulatory Policy

No doubt, regulatory policy as a discipline is a comparatively new area of social science. In regard to the question, why should governments have a regulatory policy? These questions need to be debated and explored against the earlier complex economic and societal sectors. Over the last three decades, the introduction of regulatory policies to promote effective regulation is now an important agenda as policy objective in the governance process in the OECD countries. The continuous financial crisis and recent debates on climate change focused on the importance of effective regulatory policy, as the countries faced serious regulatory failures. Furthermore, business sector and citizens continue to complain that excessive red tape inside of bureaucracy stops the better performance in economy and makes ordinary people suffer for excessive time filling out government paperwork. Therefore, it needs to focus on the current regulatory institutions, tools, and processes on why they have been failed to deliver consistently better performance (OECD 2011).

As already stated, regulation is important to the proper functioning for financial institutions and in societies. Added to that, effective public governance creates a boundary of relationship among citizens, business, government, and civil society, which protect the civil and political rights and maintain safety and security of citizens and develop the delivery of various public goods and services. A good regulatory policy helps to achieve economic objectives, the fulfillment of wide range of societal goals including social services and environmental protection and preservation, as well as maintains the rule of law. For doing so, regulations and its legal frameworks need to maintain high-quality policy objectives. It supports the policy-makers to reach a rational decision-making about what to regulate, whom to regulate, and how to regulate (OECD 2011).

The use of regulatory policy to develop decision-making process has various tools and processes. It is pointed out that different kinds of tools and processes should be deployed in a systematic so that quality improvement is easily maintained. However, different tools include analysis of regulation, the design of regulatory alternatives, simplification of administrative procedures, maintaining transparency in regulatory process, and ex post evaluation of the current regulation.

## Rationality of Regulatory Governance

Sound regulatory governance maximizes the benefits which deliver regulations in such a way that supports transparency in activities and active participation of citizens in the application of regulatory powers, through the uses of public opinion and open communication. It is important to note that complexity of regulatory governance such as the absence of transparency in introducing new regulations and inefficient and improper execution of regulations provides a scope for corruption; hence, in some developed countries, they adopt regulatory policy in such a way which may lessen the scope of opportunities for corrupt behavior and reduce its negative impacts on economy and overall society (OECD 2012).

Why does the central government, in these days, decide to delegate some administrative decision-making power to other bodies? In replying to the question, there are varieties of debates and discussion about why political actors should voluntarily transfer important power to other. Having reviewed the arguments, three points could be highlighted. Firstly, it refers to the credibility of a regulatory decision, also called the credible commitment rationale (Westrup 2007). If, it is felt that regulatory decisions are withdrawn suddenly due to changing public opinion or policy of the government, the consequence will certainly be considered a less desirable policy outcome. Given the context, the credible commitment rationale is justified, for instance, the main function of the central banks are given independence to conduct regulatory decision regarding monetary policy, claiming that it helps to establish a lower rates of inflation than a monetary policy regime directly adopted by the government (Grilli et al. 1991). This argument provides a rationale for the current regime to hold the future governments not to change the existing policies.

The second justification is that it helps the government not to be criticized for unpopular decisions; rather, the blame could be shifted to the regulator (Egan 2004). However, regulators must provide decisions in important policy issues, so there will be political advantage of the governments to take the responsibilities for decisions they made that could bypass movement of civil society and interest groups (Westrup 2007). As the third rationale, it requires a high level of technical expertise in the regulatory decision-making. It is pointed out that regulation and regulatory bodies involve complex policy issues with high technical requirement that pose significant challenges to the existing departments of the government, as they suffer sufficient expertise (Majone 1997). Hence, the new establishment of an independent regulatory body provides the cultivation of technical expertise, both in terms of allowing for high levels of trained officials and in the ability to appoint outside of normal public service staff (Westrup 2007).

## Need for Good Regulatory Governance

Features of a good regulatory regime refer to effective regulatory institutions, tools, and processes. It is argued for the establishment of legitimacy of the bodies (through law or government order) as indictors of regulatory effectiveness. Many studies found that a good performance of a sector depends on whether it maintains sound regulation. Apart from that, it is pointed out that shortage of resources for the regulatory body, absence of legal authority to get important data and information, and poor management or union constraints or intervention from the executive correspond to poor performance of a sector, although regulatory tools and processes are effective (Berg 2009). In the OECD countries, regulatory policy is grounded on the perspective that it is the role of the government who operates the "rules of the game." In this regard, every government must be fully involved in improving the quality of regulation, and the approach must not always be reactively responded to the non-execution of regulation (OECD 2011).

Regulatory governance is based on the principles which encourage inclusion of different stakeholders, namely, the legislature, the judiciary, subnational and supranational levels of government. Effective regulatory governance reaps the benefits of regulatory policy which positively impacts on economic growth and development and societal advantages, which fulfill public policy goals (OECD 2011).

Financial system oversight agencies recognize the importance of sound regulatory governance. In order to counter economic recession, there has been a growing importance on tools and processes of financial system, which is developed by regulatory decision-making authority (Das et al. 2004). Das and Quintyn (2002), for the first time, introduced a systematic approach regarding the significance of regulatory governance in order to maintain financial stability. They pointed out three views which are necessary for effective regulatory governance: (i) an operational framework on regulatory governance; (ii) the process of financial governance for the standard – setting activities of the nonfinancial sector – and (iii) the existing operating practices in regard to the tools, processes, and institutions of regulatory governance.

Effective regulatory bodies have a dominant role in overseeing the execution activities in the financial institutions. However, it is expected that in order to achieve the policy objective in financial sector, regulatory bodies themselves need to maintain sound governance practices. It is pointed out that effective regulatory governance relates to good performance of financial institutions which runs through the credibility of regulatory agencies. If regulatory agencies fail to operate democratic principles, they must lose the hope of upholding the credibility, thus a resultant moral hazard to operate sound practices in the financial institutions under their oversight (Das et al. 2004). Sound regulatory governance is explained as (a) the capacity to manage scarce resources efficiently and to design and execute sound policies and regulations which are considered as the duty to attain the delegated responsibilities and (b) the fulfillment of objectives of the regulatory bodies which is decided under the policy of elected regime (Das et al. 2004).

### Transparency and Accessibility

Transparency and accessibility to regulatory institutions are the important agenda for effective regulation. It holds the regulators into account for their activities which show confidence among the citizens toward the legal environment of local jurisdiction. This will make regulatory institutions more accessible and will not be influenced by special interest groups or group lobbying. However, transparency of regulatory bodies involves a range of activities covering clear process or steps for making any changes in regard to regulations, watchdog procedure, and provision of regular reporting that will be applied consistently by regulators, effective communication channels and wide dissemination of regulations and simple language drafting, controls on the excessive use of administrative discretion, and effective grievance reprisal and appeal procedure. It is also argued that public opinion and prior consultation of appropriate stakeholders for the formulation of new regulation help to engage citizens that develop the quality of regulations. Therefore, there has been a recent phenomenon to the introduction of e-government to improve the transparency of regulatory bodies.

It is to be noted that regulations contain much information in regard to the rules of the political game. If common citizenry and businesses access easily and clearly understand regulations and, furthermore, if the steps or processes for regulatory decisions are transparent and maintain standardized procedures, in that case, public officials may face difficulties to apply arbitrary rules. Furthermore, strong oversight mechanisms maintain quality controls, and provision of regular public reporting must ensure compliance with the tools and processes of regulatory institutions (OECD 2012).

### Impact Analysis of Regulatory Agencies

Regulation adopted by the government is sometimes very complex and not easy to understand; therefore, it requires plain drafting in language. If otherwise, governments will be in trouble in executing regulatory decision-making, as regulatory tools and processes are unnecessary complexities or badly designed. As already mentioned, the resultant unnecessary complexities of regulation can potentially encourage corrupt behavior in offices that brings failure to the desired policy outcome. This provides privilege to the vested interests of specific groups at the expense of maximum social advantage. This poor quality of regulation may engage and support to the opportunistic behavior of public officials, which may promote them for their own private gain but at a cost to public office. Therefore, a systematic evaluation over the regulatory agencies on a regular basis is essentially required; otherwise, it may disproportionately benefit to a specific interest group (OECD 2012).

### Avoidance of Complexity

If it is found that regulatory rules and processes are too complex; in that case, it may create excessive regulatory burdens to citizens and businesses and ample of opportunities for corrupt behavior in public office which encourage the growth of informality in economy. It is worth to mention that there is a negative relationship between regulatory quality and corruption. Considering the issues in mind, the OECD introduced a "Guiding Principles for Regulatory Quality and Performance" which ask to the governments to reduce the aggregate regulatory burden in an objective to lessen administrative costs to those affected, especially for citizens and businesses, as a part of policy to promote growth and economic efficiency (OECD 2012).

There is no doubt that the more complex the regulations are, the more opportunities for public officials and specific interest groups to find alternative paths on how to ignore the regulation through adopting unfair means. Furthermore, excessive complexities of the regulation make users unable to understand easily. This condition creates a possibility for public officials or regulators to "be creative" to those affected citizens and businesses who depend on it. Hence, it requires proper guidelines, appropriate tools, and clear processes of regulation, if, otherwise, it may create confusion and lead to arbitrary and unreasonable administrative discretion, thus potentially discriminatory exercises (OECD 2012).

The above conditions can be explored on business sector. For instance, if there is a complex

system as regards business licenses and permits that required approval from several institutions to start a business, steps and requirements for obtaining those permission are not clearly mentioned, in this regard, the whole process may be delayed and have complications to get approval. No doubt, these conditions may create a perfect incentive to public officials for using bribes to speed up the handling of licensing or permitting procedure that is a typical example. Note also that in some other countries, the license or permit procedure is further complicated due to additional intermediaries (e.g., notaries) which are required to deal with the approval process (OECD 2012).

### Effective Inspection

Regulatory bodies act in increasing public trust and integrity in economy and society. Regulatory bodies are those public agencies that are primarily focused on execution and inspection. In this regard, inspection is an important issue for a successful implementation of public policy by pointing out that their regulated areas function effectively and regulators are accountable for their actions, transparent in their activities and responsive to any claims, and also not prone to wastage of public money and unethical and corrupt behavior.

Inspection, as an important public policy instrument, allows regulatory agencies to monitor and regulate the activities whether they have legitimacy, are efficient in discharging responsibilities, properly respond to public interest, or are prone to wastage of money, criminal activities, and corrupt behavior. It is also important to note that inspection conducted and organized by regulatory bodies helps to comply with the regulatory guidelines and enhances enforcement levels. This condition obviously strengthens the rule of law but also lessens the informal economy and illegality which are the main promoter of corruption (OECD 2012).

However, a number of strategies and requirements should be deployed by on businesses and citizens (de Luiz 2016). If this is a motto to fight against corruption effectively, first thing, government should discard any scope for incentives and opportunities that cause corruption. In this process, a regular but professionally performed inspection can identify systemic risks and failures which provide possibilities for wastage of public money and bribe while on official duty. Note also that skilled and trained inspectors offer comprehensive and effective solutions in the designated reports to solve risks and failures. For taking action, regulatory authorities notify to the concerned institutions including public prosecutor's office and/or anti-corruption agency in regard to corrupt practices and to bring those accused who have been involved in corruption before the judiciary (OECD 2012).

## Definition

The governance of social enterprise includes systems and processes ensuring the overall direction, supervision, and accountability of an organization.

## Introduction

In organization and management studies, the term "governance" refers to the processes, rules, and structures used to govern an organization and ensure its accountability. It includes mechanisms for balancing the interests, or answering the needs, of a range of stakeholders including shareholders, employees, clients, suppliers, donors, communities, and governments. Governance structures are used to govern all types of organizations, including social enterprises.

However, due to the hybrid nature of social enterprises, in which both a social mission (similar to non-profit organizations) and a financial mission (similar to for profit organizations) co-exist, an ad hoc governance structure applies, which reflects their organizational complexity.

G

## Defining Social Enterprise

Different people in different countries at different times have understood the concept of social enterprise in distinctive ways (Kerlin 2013; Sepulveda 2015; Teasdale 2012). The term was initially used in the 1990s in Western Europe and the USA, and different traditions within and shared by the two continents have shaped the meanings assigned to social enterprise (Defourny and Nyssens 2010).

In Western Europe, social enterprise has been seen as a (partial or total) nonprofit-distributing organizational form, operating with democratic governance, which works mainly in partnership with the state to address specific societal goals (Defourny and Nyssens 2010; Poledrini 2014). This definition was principally developed by the EMES network (EMergence des Entreprises Sociales en Europe), which started as a European research network and emerged from a mainly cooperative tradition. Social enterprise has also been conceptualized as the managerialization or "hybridization" of nonprofit organizations which aim to deliver public services (Evers 2005; Haugh et al. 2010). It has also been recognized as a means of developing local communities, which is why the term "community business" or "community enterprise" was previously used (Pearce 2003; Taylor 2003). From more of a US-based perspective, social enterprise in Europe has also been framed in relation to business organizations aiming to provide goods and services addressing societal needs (Leadbeater 2007).

In the USA, social enterprise has implied an increased reliance of nonprofit organizations on commercial revenue sources (Kerlin 2013; Alter 2007; Dees 1998; Dees and Anderson 2006). Alongside this conceptualization, another definition focuses upon the role of individual innovators pursuing social change (Dees and Anderson 2006). Here, a strong emphasis is placed upon the idea of "heroic" entrepreneurs as change agents creating social value and operating to provide public or social goods (Dees 1998). Finally, a "mission-related impact" approach has also been promoted, in which both for-profit and nonprofit organizations can operate as social enterprises. In this view, their mission is to provide "disruptive change" in answering the societal needs of their targeted group and/or of society at large (Martin and Osberg 2007).

Differences in the definitions of, and the traditions within, organizations operating for a social purpose have been observed by Teasdale (2012) as occurring in two dimensions: on the one hand, in collective versus individualistic governance, and on the other hand, in reliance on commercial versus social goals. Democratic governance is important in the European conceptualization because of its historical roots in collective action and participation in cooperative and mutual traditions (Evers and Laville 2004; Peattie and Morley 2008). The American approach focuses more on individualism and entrepreneurship, and here, social entrepreneurs play a key role in fostering innovation and acting as "change makers" (Dees 1998). In terms of commercial and social goal orientation, in Europe the public sector represents one of the favorable areas within which to pursue social goals through contractual agreements (Alter 2007; Borzaga and Defourny 2001; Defourny and Nyssens 2010; Kerlin 2010). However, drawing on both the USA and European traditions, in recent years an approach has emerged which identifies any organizational form which aims at achieving positive societal impacts as a social enterprise (Doherty et al. 2014; Ridley-Duff 2015; Teasdale 2012). This conceptualization includes both social enterprises that trade with the public sector and organizations that aim to achieve a positive societal impact in distinct markets.

Among all these conceptualizations, only two common characteristics exist: the primacy of the social mission and the adoption of some form of trading (Defourny and Nyssens 2010; Doherty et al. 2014; Peattie and Morley 2008; Peredo and McLean 2005). Therefore, an inclusive definition is one which sees social enterprise as a market-based activity which aims to further a social purpose (Hayllar and Wettenhall 2013; Kerlin 2006). Governance mechanisms must therefore reflect both of these characteristics.

## The Governance of Social Enterprise

Corporate governance has been defined as: "[A] set of relationships between a company's management, its Board, its shareholders and other stakeholders [. . .] also (providing) the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance are determined" (OECD 2004, p. 11).

In corporate governance theory, paradigms are defined by building either on a competitive or a collaborative relationship between boards and management. Conceptualizations that emphasize competition dynamics consider boards and management as bodies responding to different interests which are inspired by different goals. Therefore, governance mechanisms are set either to ensure a board's control over management or, from the opposite perspective, to ensure that managers have a large space in which to maneuver in setting organizational goals and the means to reach them. Conceptualizations that focus on the cooperation between boards and managers, on the other hand, see governance as a means by which to ensure that both the board and the managers fine-tune their interests and mutually support each other for the overall wellbeing of the organization.

A similar theoretical elaboration has occurred in social enterprise studies. Among the theoretical approaches emphasizing competitive dynamics, the agency theory model understands governance as a means for a board to ensure that management always acts in the organization's best interests. In

other words, in the agency model, the aim of a social enterprise's board is to make sure that the social purpose of the organization remains at the core of its activities, while management may tend to prioritize profit-making instead (Spear et al. 2014). Among the models focusing on the cooperation between boards and managers, the stewardship model of governance considers managers and boards as partners each with their own, complementary, task: boards focus on strategic organizational direction, while managers contribute their managerial skills, as well as their own ideas, to organizational success (Muth and Donaldson 1998). When stewardship theory is applied, it focuses on the role of noneconomic factors in facilitating the achievement of the social mission, such as the quality of the relationships within the organization (Mason et al. 2007).

Other theoretical models include the democratic perspective, in which organizational governance is conceptualized as ensuring the adoption of the decision-making mechanisms typical of democratic settings (a board and management appointed by open elections; pluralism in the representation of interests and ideas; accountability). Here, boards represent the range of the organization's interests and adopt policy decisions respecting and reflecting such differences. In this model, all the organization's members can put themselves forward for board appointment, as the board composition prioritizes membership representation over candidates' expertise (Spear et al. 2014).

From a different perspective, stakeholder theory emphasizes the variety of social interests which a social enterprise may represent; therefore, according to this paradigm, governance mechanisms should ensure an optimal combination of the relevant different social interests when boards and managers are appointed. Boards have the power to take decisions in case of conflicting interests and to decide which interests should be prioritized. When stakeholder theory is applied in a social enterprise perspective, the organization's interests are explicitly recognizable, and governance processes should prioritize them over others. A combination of the stakeholder approach with a democratic governance will allow stakeholders to be directly involved in organizational operations, contributing to realizing the mission upon which the organization has been founded (Pestoff and Hulgård 2016). However, this may raise the issue of prioritizing the needs of different stakeholders as well as the risk of shifting away from the needs of the intended group of beneficiaries.

Another approach is proposed by resource-dependency theory, which considers governance as a tool by which to secure the resources the organization needs. As such, boards' members, along with managers, have to contribute their personal social capital as well as their professional skills to maintain a vibrant set of ties with potential public and private funders, communities, activists, volunteers, and clients (Spear et al. 2014).

Another theoretical approach, managerial hegemony theory, assumes that due to the increasing professionalization and formalization of social enterprises, the management is the key decision-making actor in the organization, due to possessing the competences and skills the organization needs to succeed. Therefore, the governance structure of social enterprises should ensure that boards are mere executors of the management decisions (ibid.).

Because of the variety of organizations in the social enterprise sector, a wide variety of governance structures can be found, with different levels of formalization, board size, and composition. Board structures are also influenced by the client group, the size of the organization, the typology of the market served, and the main resources being accessed (Spear et al. 2014). Client group issues can influence important aspects of governance such as users' involvement (e.g., if the organization deals with mental health patients or intellectually disabled people, getting them involved in the organization's functions might be challenging or sometimes inappropriate). The size of the organization directly influences the levels of formalization and professionalization needed, and therefore the degree of "managerialism" requested. A start-up organization may operate with a small, informal governance structure, while a large organization managing more significant sums

of money would require adequate expertise and skills to do so, and therefore a more complex governance structure. Finally, the type of market served and resources required influence governance models with respect to risk (Spear et al. 2014). An organization providing services for the public sector should be ready to face risks arising from policy and political changes, and also to manage service delivery compliance issues, all of which requires well-developed governance. Similarly, if a social enterprise operates in the health sector, it should apply clinical governance standards that imply a heavier level of governance (ibid.).

Another aspect through which the governance of social enterprises can be understood is the system of board reproduction (Spear et al. 2007). Models include:

- *Self-selecting* boards: New board members are appointed by existing board members. Board members derive their power from being accountable to themselves, as usually these types of organizations have no or very few members (e.g., foundations, trusts). Their power may be mitigated by their social mission drive.
- The *democratic member-based structure*: Board members are democratically elected by the wider membership of the organization. This type of social enterprise should pay attention to its membership's involvement in activities, but also to how they control the management. The democratic model emphasizes how governance mechanisms make board members and managers accountable to them.
- The *hybrid* structure: Board members and the wider membership both exert influence over board recruitment and appointment, and the board is composed partly by elected and partly by co-opted members. While board members manage selection, it is the wider membership that manages appointment, thus ensuring democratic accountability and the harnessing of members' support, but still leaving space for maneuver to the board with respect to hiring competent or well-connected individuals (ibid.).

## Conclusion

Governance is an important aspect of social enterprises, as it provides them with the structure and mechanisms they need to govern their actions and ensure accountability. But it is also a means by which to ensure that the organization achieves the social purpose for which it was funded. Governance mechanisms allow social enterprises to penetrate societal needs and to reach a range of interests and ideas, by adopting a multistakeholder model in which different actors become the organization's points of reference. When governance is inspired by democratic principles, social enterprises can also foster people's participation, simultaneously increasing civic values and strengthening their own social legitimacy.

However, governance is also an area in which challenges and potential conflicts arise, especially at a time of rapid change in the economic, social, and political landscapes in which social enterprises operate. For example, the increasing professionalization and formalization of social enterprises due to the complex co-production of public services may generate conflicts between boards and managers. It may also lead social enterprises to prioritize their own survival as a business operator regardless of their social impact. Finally, governance is also the mechanism allowing social enterprises to find those energies and ideas which will enhance beneficiaries' and communities' participation and providing them with the tools to re-invigorate their original purpose of contributing to the common good.

# Governance and the Entrepreneurial Society

Oluwagbemiga Oluwaseun Ajayi
Department of Sociology, Osun State University, Osogbo, Osun state, Nigeria

## Synonyms

Authority; Business; Human development; Leadership

**Governance**: The social and political context within which people interact, and by which activities are coordinated

**Entrepreneurial Society**: A society where the habits of entrepreneurship which include identifying, creating, and maximizing opportunities are widespread and deeply ingrained, and in which the structures and institutions support these habits.

## Introduction

What is the entrepreneurial society? What is its link with governance? What is the link between entrepreneurship and social transformation?

Academic literature is replete with information on the role and importance of entrepreneurship in the society, but relatively little attention has been paid to the concept of the entrepreneurial society. The pertinent questions are, given the importance of entrepreneurship, how can an entrepreneurial society be created and what, if any, is the role of governance in the process? These questions constitute the central idea of this article.

In the following paragraphs, a new and modern definition of entrepreneurship shall first be presented, while contrasting this with the classical definition of entrepreneurship. The entry will then move on to a discussion of the entrepreneurial society, focusing on its description, characteristics, and importance. The focus of the entry then shifts to governance by comparing governance with government. This is important so as to clear up any confusion that may arise due to the similarity of the two terms. That section concludes with a discussion of the concepts of governance and leadership. The rest of the entry will then discuss the role of governance in entrepreneurship development. The entry concludes with the argument that the future of the world, particularly the developing world, is in the creation of entrepreneurial societies.

## A New Definition of Entrepreneurship

The classical definition of entrepreneurship originates from the Frenchman J.B. Say who defined the entrepreneur as someone who "shifts economic resources out of an area of lower and into an area of higher productivity and greater yield. The agent who unites all means of production and who finds in the value of the products.... the re-establishment of the entire capital he employs, and the value of the wages, the interest and the rent which he pays, as well as the profits belonging to himself" (Say 1816). Say thus set the stage for the entrepreneur to be regarded primarily as someone whose activities are confined to the economic arena. Hence, Schumpeter (1934) initially suggested that "The carrying out of new combinations we call 'enterprise'; the individuals whose function it is to carry them out we call 'entrepreneurs'," and later defined entrepreneurs "as individuals who exploit market opportunity through technical and/or organizational innovation" (Schumpeter 1965). Onuoha (2007) sees entrepreneurship as "the practice of starting new organizations or revitalizing mature organizations, particularly new businesses generally in response to identified opportunities" and Bolton and Thompson (2000) defined an entrepreneur as "a person who habitually creates and innovates to build something of recognized value around perceived opportunities." Following these definitions, the entrepreneur creates businesses and attempts to maximize profit. This classical view of entrepreneurs and entrepreneurship binds the entrepreneur with two limitations: her activities are confined to the commercial arena. Secondly, she only seeks to maximize profits.

But the definition of entrepreneurship has since become more inclusive, allowing activities apart from the economic to be included into the term. The modern definition encompasses all activities involved in identifying, creating, and maximizing opportunities in any social sector. This modern viewpoint sees entrepreneurship as possible in all areas of life. This is what Westlund (2011) calls multidimensional entrepreneurship. Thus, contemporary scholarship recognizes terms such as religious entrepreneurship, political entrepreneurship, social entrepreneurship, and entrepreneurial governance.

A number of differences can be noted between the old and the modern conceptions of entrepreneurship. In the past, the entrepreneur is the one who starts a personal business. Now there are those who start new lines of businesses for large established companies. These are called intrapreneurs. In starting a new business within an established organization, intrapreneurs must be as adept and innovative as those who start companies for themselves. Intrapreneurs must eliminate of greatly minimize both the internal and external risks of the organization while fully exploiting all the relevant advantages of the parent company. In this way, large established companies may be entrepreneurial themselves. A large, established company can deliberately create internal structures that allow it to be nimble and agile so as to be able to quickly identify, create, and exploit new market opportunities. Or it may create

what is called a skunk works, a small section of the company which is allowed to work without the internal constraints facing the other parts of the company. In this sense, size need not be a hindrance to entrepreneurship.

Secondly, size is no longer a factor. An entrepreneur may own a small, large, or medium sized company. If in actual fact, "innovation is the specific tool of entrepreneurs, the means by which they exploit change as an opportunity for a different business or a different service" (Drucker 1985), then most new, small businesses are not entrepreneurial. They do the same thing as thousands of other similar businesses and add no real value to the market. A small, new company is not entrepreneurial when it totally lacks innovation in any of the aspects of its business: funding, product, distribution, marketing, sales, customers, pricing, and management. In a nutshell, small is not synonymous with entrepreneurial. This is why Drucker (1985) argues that entrepreneurs are few among new businesses. According to him, "entrepreneurs create something new, something different; they change or transmute values."

Thirdly, profit is no longer the sole motive. Now entrepreneurs start and are found in all types of organizations: for profit and not for profit. Religious organizations, universities, and charities can be entrepreneurial. Once again, the yardstick is innovation and maximization of opportunity. A not-for-profit organization is entrepreneurial when it identifies and implements new ways to serve the public.

## The Entrepreneurial Society

In 1985, Peter Drucker predicted the coming of the entrepreneurial society. He described revolutions as the outcome when the need for renewal is denied in the society. The antidote he prescribed is the promotion of entrepreneurship in the society. He proposed that society need to be so organized as to quickly discard what is no longer working and also encourage attempts at innovation and entrepreneurship. Precisely, he stated that, "What we need is an entrepreneurial society in which innovation and entrepreneurship are normal, steady, and continuous. . .innovation and entrepreneurship have to become an integral life-sustaining activity in our organizations, our economy, our society." In this way, the cycle of change will run unhindered and the need of revolution will be eliminated. Given the potential benefits of the entrepreneurial society, what can be done to create such a society deserves attention. But first, there is need to explain in more detail what the entrepreneurial society means. To do that what it does not mean shall first be clarified. It needs to be noted that this is not meant to be an exhaustive treatment of the concept, but only an introduction. In any case, a much more comprehensive analysis would be beyond this book.

The entrepreneurial society is not a society where a lot of new, small businesses are being created. The crucial question to ask here is "what is the value of the businesses being created?" All over Africa, people are starting millions of micro-businesses which add little or nothing to the economy. There is thus a lot of activity with little or no worth. At best, these subsistence entrepreneurs make enough profit just to keep their families living from day to day. In actual fact, many of these businesses have negative impact on the economy due to their waste of resources. The new firms must add value for them to be truly entrepreneurial.

An entrepreneurial society is not focused on the economy alone as an indicator of development. This realization, in a sense, is what led to the emergence and acceptance of the concept of human development. According to the United Nations, human development "is about expanding the richness of human life, rather than simply the richness of the economy in which human beings live. It is an approach that is focused on people and their opportunities and choices" (UNDP website). Every society has other resources beyond the economic. These other resources include the social(cultural), spiritual (religious), and mental(intellectual). The aim, therefore, in an entrepreneurial society is to fully develop and exploit all these resources. This idea of holistic human development, beyond the merely economic, is a central tenet in entrepreneurial societies. It goes beyond mere intellectual realization and acceptance. It drives policy

formulation and implementation. It drives the functioning and interaction of institutions. This is important because every kind of society includes social, psychological, cultural, and technological aspects. The human development tenet realizes all of these aspects must develop together.

Having established what the entrepreneurial society is not, what it is may then be considered. The most important features of the entrepreneurial society are that it is flexible, practices continuous learning, and promotes change. Any society that would be entrepreneurial in thought, attitude, and practices must be flexible. This flexibility means that such society does not rest unduly on the familiar and comfortable, but must be willing to try out the new and uncomfortable. Then it must possess enough social capital to be able to quickly readjust to new realities. A society that is too rigid cannot make meaningful progress. Flexibility is in degrees and may be viewed as being on a continuum, with absolute rigidity on one end and absolute flexibility on the other end. Neither of the two extremes are desirable. Indeed, extreme flexibility may be difficult to cope with. Some rigidity is needed by society so as to be able to provide a stable and familiar context within which people may live out their lives.

Secondly, the entrepreneurial society promotes change. The entrepreneurial society not only is flexible, so that it can absorb new cultural elements and adjust to them, it also promotes change by its members. While the former is macro, the latter is micro. The structure of the society is flexible, and the members of the society are open to change. No part of such society is exempt from these changes including politics, religion, education, entertainment, and law.

Thirdly, the entrepreneurial society promotes and rewards continuous learning. In the past, there wasn't much need for new information in order to live a fairly good life. A printer's son grew up to be a printer. A cobbler's son grew up to be a cobbler. Likewise, a manager's son grew up and was trained to become a manger. In addition, by the late teen or early twenties, the child had learnt all there is to know about the craft. All that was subsequently required is for the child to faithfully continue in that path. Also, there was no need for the child to learn anything new. What has been learnt would be continued unchanged throughout the child's life. Thus, the child was trained and would not depart from it. In an entrepreneurial society, the child must learn new things well after well after adulthood so as to stay relevant. For the child to truly prosper, then she must keep learning new things even at a faster rate, for such a society not only changes, but does so quite rapidly. It is therefore imperative for anyone who would thrive in such a context to embrace continuous education. The need to keep up with changes in the society will require adults to learn new things and adapt to new realities. This manifests as continuous learning all through adult life.

## Importance

Three major factors make the entrepreneurial society an important ideal for the society. One, it provides an antidote to social unrest by providing a safe avenue for nonviolent change. A major cause of social revolutions is social and institutional resistance to change. When the status quo is rigidly defended and maintained, even in the face of widespread and deep-seated calls for change, the consequence is violent outbreaks such as revolutions. Though this may seem simplistic at first glance, it is the major cause of many of the bloody revolutions that the world has known. If only the leaders of such societies had been more flexible, some of these revolutions may not have happened.

The entrepreneurial society also provides a relatively safe context for the unconventional and eccentric, without whom significant progress is almost impossible. Real progress is often instigated by those who think differently, see the world differently, and therefore act differently. The initial reaction of the society is to label them as eccentric and unusual. And many times, the social opposition becomes more active. History is replete with persecutions suffered by many who propagated unconventional ideas. Many of the ideas, which are mainstream today, were violently rejected at their beginnings. Classical examples of these include the scientific ideas of Copernicus and Galileo Galilei in the field of astronomy, which were initially rejected by the Catholic Church.

The entrepreneurial society also provides for the full development of the individual. This is the

human development concept that was referred to earlier. People have many dimensions. People also want to satisfy all the needs in Abraham Maslow's hierarchy, and not necessarily one after the other. Many times, the restrictions preventing people from fulling developing and utilizing their capabilities are structural. These structural difficulties are removed in the entrepreneurial society. Such a society would have a high level of social mobility, removing the roadblocks confining people to one class or station in life. Such a society would allow for the maximum expression of individual freedom. Such a society would allow new ideas to be tested, proven, and implemented. Such a society would allow the coexistence of different – even opposing – groups and allow people to freely drift in and out of these groups to settle in whichever best suits them and their purposes.

## Governance

It is difficult to find one predominant definition of governance or even an agreement on what the definition should include. Therefore, the term is used according to the context within which the word is employed. Grande (2012) identified five key elements in governance concepts: "(1) new nonhierarchical structure and mechanisms; (2) governing and the criticism of hierarchy as steering principle; (3) emergence of new actors, either private or nonprofit; (4) increasing complexity of political actions, and (5) increasing cooperation and collaboration among stakeholders."

As suggested by Ysa et al. (2014), governance is an ancient concept. The etymology of the word is found in "kybernan," a Greek word that means to steer a ship. A related concept is found in the word "gubernare," a Latin word meaning to direct. Over the passage of time, the meaning of the word now broadly includes the interaction between the major actors within the state by which policies are formed and implemented. These major actors include trans-national and sub-national authorities as well as private organizations. In effect any group that can influence policy decisions and implementation is included in the governance structure. Two major forces which have influenced this decentralization of power are globalization and the internalization of problems (Ysa et al. 2014). As a result of this, authorities beyond the nation states, such as the UN, have very real roles to play in the organization of the planet. Concurrently, smaller actors, such as private firms, also play important roles within their local contexts.

Governance goes beyond government. "In its widest sense, it refers to the various ways in which social life is coordinated" (Heywood 1997). This point of view makes government one of the institutions in governance. The term also includes civil-society actors who are important players in the society (Mette Kjaer 2004). Therefore, governance is not limited to the existence of government. In fact, governance is possible where there is no government. Governance is thus the social and political context within which people interact and participate in the society. Also, these two concepts can be separated by associating government with "control and domination," and governance with "decentralization and relational management" (Tamayao 2014). In this sense, government is a centralized political authority exercising power over citizens, while governance is about decentralization of power. Government holds on to power and uses it for the purposes it deems fit, while governance spreads authority among various state actors and recognizes a broader participation in civic life.

Following are some definitions of government:

> "the process of governing through which decisions are made that are intended to affect societal outcomes, including economic, social, environmental and other important outcomes." (Wolman et al. 2011).

> "the formulation and execution of collective action at the local level. Thus, it encompasses the direct and indirect roles of formal institutions of local government and government hierarchies, as well as the roles of informal norms, networks, community organizations, and neighborhood associations in pursuing collective action." (Broadway and Shah 2009)

> "The office, authority or function of governing. Governing: having control or rule over oneself." (Fasenfest 2010)

On the other hand, governance has been defined as:

> "structures and processes that are designed to ensure accountability, transparency, responsiveness, rule of

G

law, stability, equity and inclusiveness, empowerment, and broad-based participation. Governance also represents the norms, values and rules of the game through which public affairs are managed in a manner that is transparent, participatory, inclusive and responsive" (Hewitt de Alcántara 1998).

"power relationships', 'formal and informal processes of formulating policies and allocating resources', 'processes of decision-making' and 'mechanisms for holding governments accountable'" (2009 Global Monitoring Report).

"A set of decisions and processes made to reflect social expectations through the management or leadership of the government" (Fasenfest 2010).

## Governance as Leadership

In effect, governance is about leadership. If leadership is about making decisions, communicating with the group to enlist them in the collective project and analyzing the results of actions in order to modify or continue with prior decisions, then governance is about effective leadership. It is a decentralized process in which capable members of the group are allowed to participate in the decision-making process. In this process, the task is not left for a central authority of committee. Rather it is diffused. And the effect is that just as leadership can be dynamic or conservative, so also can governance be dynamic or conservative. Dynamic leadership actively creates what is needed. It sets the pace. Conservative leadership is reactionary. It manages to respond to changes forced upon the organization. Just as leadership sets the pace, tone and direction for the group, so also is the nature of the governance structure reflected in the entire system.

## Governance and Entrepreneurship Development

Entrepreneurship development is about social change. Social change may be viewed as alternations in culture, social structure, and behavior happening over time. This refers to modifications in any aspect of society, both of material and nonmaterial culture. Social change may then be regarded as a normal feature of society, as change is regarded as a normal part of the human experience. Regardless, change is not always welcome. In fact, change is often resisted. However, change continues to happen, with or without its acceptance. Entrepreneurship development is about teaching entrepreneurial habits, encouraging the adoption of these habits and creating social structures that support these habits. In other words, entrepreneurship development is about teaching and supporting people to behave in new ways. This makes entrepreneurship development a program of social change.

There are two broad ways in which social change happens. It may be unplanned and unprompted, or it may be planned and deliberate. Fashion fads are many times unplanned, despite the desire of fashion companies to do so at will. The changes in the American diet during the Second World War, which made organ meats a staple American food, were deliberately planned and executed.

Entrepreneurship development is about teaching habits of entrepreneurship. These include: risk management, independence, innovation, idea generation and implementation, sales and marketing, hard work, resilience, and excellence as seen in high quality service. Developing entrepreneurship is about promoting these habits in members of the society, with a view to attaining development. Much more than merely teaching entrepreneurship practices, this is about creating the proper social and economic context for identifying, creating, and exploiting opportunities. That is at the macrolevel. At the microlevel, individuals learn to habits that enable them to create and exploit opportunities for themselves.

The decentralized and inclusive nature of governance thus makes it important in this regard. Adequate governance makes it possible to create, implement, and monitor the right mechanisms for teaching the social habits of entrepreneurship. The central government is usually too far removed from the arena of everyday lives where millions of microdecisions aggregate eventually into macrooutcomes. However, by the time the micro turns macro and is noticed by the agents of government, the government can only play catch up. The solution once more is an adequate governance structure that involves a wide array of social agents and is equipped to view and respond to micro level occurrences in the society.

## Conclusion: Development and the Entrepreneurial Society

Economic development has always been led by entrepreneurs. They create new jobs by starting new firms, and they exploit opportunities that expand the economy and bring economic prosperity. But beyond the economic, development must be all inclusive, hence, the idea of human development. This is why an entrepreneurial society is needed. All sectors of human life need individuals who will do for their own sectors what entrepreneurs do for the economy. Schools and hospitals need entrepreneurs. The military as well as religious institutions need entrepreneurs. Politics and law need entrepreneurs. Comprehensive social transformation is dependent on entrepreneurs in all areas. The entrepreneurial society is that which most fully guarantees continued development with as little waste as possible. The development of the entrepreneurial society is particularly important for the underdeveloped societies of Africa, Asia, and south America. A very important step in this regard will be to set up governance structures that can oversee real entrepreneurship development.

# Governance and the State: Theory and Russian Specifics

Dmitry Zaytsev
Public Policy Department, Faculty of Social Sciences, National Research University Higher School of Economics, Moscow, Russia

## Synonyms

Civil identity; Decentralization; Democratic government; Effectiveness of government; Functioning of government; Multilateralism; Nation; National identity; New management system; New public management; Sovereignty; State capacity; State failure; State fragility; Statehood; Stateness

## Definition

State is a type of polity that is characterized by two main dimensions: "statehood" and "stateness." Statehood is the recognition of the state by other states as independent nation, equal to others to participate on international arena; receiving and having the "statehood" for country mean that it is a part of the "concert of nations," such as the member of the United Nations organization. Stateness is a state capacity to sustain its territory, nation, and citizens' welfare; it is not enough being recognized by other states as such, but also important to support this status in time.

## Introduction: The Problem of the Loss of Centrality by the State

Governance and the state are two concepts that we use in public policy and public administration to highlight both the process of policy-making and government capacity to solve policy problems effectively.

These two concepts try to capture and explain the oldest phenomena of government and decision-making in society, which have existed since Ancient times. That is why "governance" and "the state" since Ancient Greek philosophers have a long history of conceptualization; therefore, diverse definitions of governance and state coexist with each other. Old understandings of governance and the state meet and mix with the new ones (e.g., interactive governance, new management system, global governance, multilateral governance).

Furthermore, the tendency of last decades in public policy is the loss of centrality by the state. If, for centuries, state was the central actor of policy-making, in the last decades scholars identify the tendency of the state to move from this central role and position. It was discovered by theorists both of "the state" (Linz and Stepan 1996) and of "governance" (Lenoble and Maesschalck 2010; Stivers 2008). The tendency to lose centrality by the state is indicated by the raise of the importance of identity issues in the contemporary world, the blurring of nation-state identity, and the increasing importance of local and global identifications of citizens, as well as other identities (gender, identification with particular subculture, religion, etc.) which have become more equal to national identity that was dominant for last two to three centuries (Semenenko 2012). For governance a similar shift is observed: from the state which has to govern effectively to participation and knowledge, which have become the key indicators of "participatory governance" (Kohler-Koch and Quittkat 2013; Malena 2009) and "reflexive governance" (Lenoble and Maesschalck 2010).

There are continued attempts to measure empirically the quality of governance and state capacity by scholars and international comparators (*The World Bank* "Government Effectiveness Index," "Property Rights and Rule-based Governance," "Index of Objective Indicators of Good Governance," and "Governance Indicators"; *the Freedom House* "Functioning of Government Index," *the Bertelsmann Stiftung* "Stateness Index" and "Management Index," *the World Peace Foundation* "Index of African Governance"). These indices are used not only by scholars in their research but also by practitioners (public, stakeholders, and policy-makers), who are trying to solve policy problems. These indices help them to orient in a complicated world of policy-making, to trace policy process, and policy transfer and learning from the "best examples" of decision-making in other countries and policy sectors. They need these rankings to choose more effective policy options and tools to manage social problems.

Indices can be biased not only from theoretical and methodological points of view but also because of interests of sponsors and values of international comparators, who are involved in the creation of these rankings. That is why they can also be used as tools for manipulation or the legitimation of government decisions.

The existence of diverse understandings of what governance and the state is, as well as empirical measures of their quality and capacity, confuses both scholars and practitioners as mutual crossing and mixing of the meanings of the concepts, methodological and political biases of the scholars and international comparators can lead to absurd conclusions in research and inefficient policies.

The identification of clear boundaries between the concepts, traditions to define them, and their diverse meanings, as well as contemporary dynamics in development of quality of governance and state capacity, will help both scholars and practitioners to understand policy variation and change and increase the effectiveness of policy-making in the very complicated contemporary world.

## Theories of the Governance and the State: From a "State-Centric" to "Participatory" Understanding

Territory or polity is conceded as the state, when it is recognized as such by other states as independent nation, equal to others to participate on international arena. "Statehood" is a concept that is used to define this characteristic of the state. Receiving and having the "statehood" for country mean that it is a part of the "concert of nations," such as the member of the United Nations organization.

Theories of state do not stop on reflections about "statehood" as an essential characteristic of state, but also reflect about the state capacity to sustain its territory, nation, and citizens' welfare. This aspect of the state which adds other dimensions – that it is not enough being recognized by other states as such, but also important to support this status in time – is known in political theory as "stateness." If "statehood" can be easily measured, as the UN has the formal procedure of recognition of new members of the organization, "stateness" is not so easy to assess as it is combined by several meanings.

"Stateness" as a "conceptual variable" was first used by J. Nettl (1968). Conceptualizing stateness, Nettl focused on state activity, structures, and functions and also defines historical, intellectual, and cultural dimensions of this phenomenon. Stateness is a more contestable concept than statehood as it had more dimensions; therefore, it is defined differently depending on the aspect of the state capacity that an author tries to explain. We can identify four theoretical traditions or approaches to define stateness.

The first tradition to define stateness pays attention to such aspects as being independent and autonomous from other actors: primacy, autonomy, and sovereignty of the state. These unique characteristics of stateness obtained during the historical process of the formation and development of the nation-state in modern times happened mostly in Western Europe since sixteenth century (Tilly 1975). The nation-state had replaced the "old" forms of polity (polis, empire). That is why we can call this approach the ***"historical tradition."*** It refers to the well-known definition of state expounded by Max Weber "a monopoly of the legitimate use of physical force" (Weber 1921). Tilly, analyzing the formation of nation-states in Western Europe, by stateness meant "the degree to which the instruments of government are differentiated from other organizations, centralized, autonomous, and formally coordinated with each other" (Tilly 1975, 32).

The second tradition is the "functional approach" which is a logical continuation of the historical approach to define stateness. It highlights such aspects of stateness as the capacity to perform governmental functions, establish effective structures, and concentrate recourses (or capital) for state-agency activities. This tradition refers to Bourdieu's classic analysis of state-building as a process of the concentration of capital: physical force, economic, informational, juridical, and symbolic (Bourdieu 1994). Bartolini (2005) continues this ***"functional tradition."*** He defines four dimensions of stateness: "(a) creation of the organization for the mobilization of resources: bureaucracy and tax burden; (b) external consolidation of the territory: army; (c) maintenance of internal order: police and judiciary; and (d) state activism in regulatory activities and in economic and social interventionism" (Bartolini 2005, 71). If the "historical tradition" pays more attention to the process of formation and development of modern states as independent, sovereign, and as a supreme center, whose decisions are binding on other actors and society at large, the authors of the "functional approach" took this argument as the starting point and made the step forward by drawing a more dynamic picture where the state has certain functions that

it has to establish regularly to maintain the central status.
